A technique of vacuum deposition is described for producing heat-reflecting films onto sheet plastic for application in domestic windows. Thin-metal films of copper, silver, gold, and titanium nitride sandwiched between dielectric films and electrically conducting oxide coatings of indium, indium doped with tin, and cadmium/tin are shown to have the properties required for a heat-reflecting coating for visible windows. Durability measurements suggest that conducting oxide films have more promise. It should have a payback period of considerably less than one year, both in cost and in energy saved, and have the potential to be made in large areas to make a significant impact on natural energy use.

31282 **(PB—85-167336/XAB) CEL-1: conservation of electric lighting. Software.** Treado, S. (National Bureau of Standards, Washington, DC (USA). Center for Building Technology). 1 Oct 1984. vp. Source tape is in the ASCII character set. This restricts preparation to 9 track, one-half inch tape only. Identify recording mode by specifying density only. Call NTIS Computer Products if you have questions.

The CEL-1 (Conservation of Electric Lighting) computer program is a design and analysis tool for the design of building lighting-systems. It is capable of detailed simulation of lighting system performance, including the effects of daylighting. The interaction between the lighting system and the building heating and cooling systems is accomplished through a custom interface with the BLAST (Building Loads Analysis and System Thermodynamics) building energy analysis program. This tape contains the CEL-1 program Fortran Source files, data files and procedure files, including all updates and changes through 10/1/84. A major addition is the BLAST/CEL-1 interface routine. Software description: The model is written in the FORTRAN programming language for implementation on a CDC 760 computer using the NOS 1.4 Version 528 operating system. Memory requirement is 128 K bytes.

31283 **(PB—85-169126/XAB) Domestic market potential for solid-fuel burners. Final report.** (New Zealand Energy Research and Development Committee, Auckland). Apr 1984. 40p. (REPT—84). NTIS, PC E04/MF E01.

The objective of this study was to estimate the potential penetration level for solid-fuel burners in the domestic space and water-heating market in New Zealand. The term penetration level has been defined as the proportion of dwellings in New Zealand having a solid-fuel burner installed. Solid-fuel burners have been assumed to include all forms of solid-fuel-burning appliances apart from the simple traditional open fireplace.

31284 **(PB—85-169134/XAB) Demonstration of a hot-water-heater pump system. Final report.** Carrington, C.G.; Sandle, W.J.; Warrington, D.M. (New Zealand Energy Research and Development Committee, Auckland). Feb 1984. 55p. (REPT—102). NTIS, PC E04/MF E01.

The results of a practical demonstration of six heat pumps for saving energy in the heating of domestic hot water are presented. The units were monitored for six to twelve months in private homes in Dunedin and Auckland. The study showed that the electrical energy savings depended on climate and usage levels. The national average electricity use of the heat pumps was between 50-59% lower than conventional electric water heaters. The results established that the system maintained a good standard of hot water service, with some improvements occurring in the case of heavy consumers. A review of the available economic information on the heat pump water heater shows that the optimal level of installation nationally is critically dependent on the resource costs of the heat pump and of electricity, as well as other factors. Taking the value of electrical energy saved by the heat pump to be the marginal cost, it is shown that the heat pump will be economically competitive with expansions in the electrical generating system planned for the next ten to fifteen years.

31285 **(PB—85-170421/XAB) Duplex Stirling gas-fired heat pump. Phase 2. Breadboard demonstration. Final report, May 1981-November 1982.** Gedeon, D.; Penswick, B.; Beale, W. (Sunpower, Inc., Athens, OH (USA)). Nov 1982. 76p. NTIS, PC A05/MF A01.

This program represents the first attempt to design, fabricate, and test a breadboard gas-fired duplex Stirling heat pump in a heating only mode. The system was designed to obtain a COP of 1.5 at an ambient temperature of 17F and have an output sufficient for an average residential home. The design methodology, detailed system description and test results for sub components and the entire system are discussed. Technical problems encountered in the program, and recommendations for further efforts are detailed.

31286 (PB—85-180479/XAB) **Integration of building and energy technology with on-site waste management in the year 2000. Final report, October 1979-September 1980.** Deese, P.L.; Heschong, L.; Fuller, W. (Urban Systems Research and Engineering, Inc., Cambridge, MA (USA)). Mar 1985. 174p. NTIS, PC A08/MF A01.

During this study the potential feasibility of integrating waste management, water supply and on-site energy generation was examined with the objective of improving the objective of improving the overall resource efficiency of the typical residential unit. This report can be used by members of the various research and development communities to gain understanding of other fields and is meant to foster the appreciation of the interrelationships between residential utility systems.

31287 (PNL—5123, pp Intro 1-Intro 11) **Introduction.** May 1984. NTIS, PC A13/MF A01. File Number DE85003277.

In BEPS redesign of 168 commercial buildings: summary report.

Summary data from the Building Energy Performance Standards (BEPS) Phase II covers the Redesign experiment of 1978 and the related research on ASHRAE (American Society of Heating, Refrigerating, and Air Conditioning Engineers) Standard 90-75R conducted during 1978-79. The report includes eight articles describing a baseline for energy design elements, redesign strategies for office buildings and retail stories, energy strategies for high- and low rise multifamily dwellings, the complex relationships between sleeping rooms and service areas of hospitals and hotels, heat recovery, intermittent energy use, and conclusions about opportunities based on research on 168 buildings. Major divisions of the book cover analyses of each type of building.

31288 (PNL—5123, pp Intro 13-Intro 18) **Baseline for energy design.** May 1984. NTIS, PC A13/MF A01. File Number DE85003277.

In BEPS redesign of 168 commercial buildings: summary report.

An introduction to a series of articles reporting the findings of the largest research effort ever undertaken on building design, this article describes the energy-conscious redesign of 168 commercial and multi-family residential new buildings. The study set out to develop baseline data about the energy performance of new buildings, then to determine potential levels of energy reductions that could be achieved from this baseline. The results demonstrate that significant energy reductions are possible from design practice at only a small increase in average first cost. The research provided estimates of the energy behavior of a number of building types as well as some estimate of the impact of climate on each type. 6 figures.

31289 (PNL—5123, pp Intro 19-Intro 24) **168 proof?.** May 1984. NTIS, PC A13/MF A01. File Number DE85003277.

In BEPS redesign of 168 commercial buildings: summary report.

Part of DOE's Building Energy Performance Standards (BEPS) project was the energy redesign of 168 building designs in 13 building types. Because of similarities in usage patterns and functional space mix, highly individualistic buildings can be grouped into generic types. Awareness of the relative impact of how and when space is used and the use of design analysis tools to predict results is essential to appropriate design strategies. This article summarizes the findings for office, retail, and residency buildings in terms of the relative significance of the lighting, building systems, and the building's envelope, shape, and siting. As a result of BEPS research, energy use information now goes beyond abstract numbers to identify the actual architectural and mechanical design strategies responsible for substantial energy savings. 3 figures.

31290 (PNL—5123, pp vp) **Energy to recover.** May 1984. NTIS, PC A13/MF A01. File Number DE85003277.

In BEPS redesign of 168 commercial buildings: summary report.

Although the demanding environmental requirements of hospitals limit the use of conservation strategies that are viable in other building types, the researchers in the Building Energy Performance Standards (BEPS) project found that space conditioning and heat recovery strategies were dramatic keys to reducing energy use as much as 50% without compromising health care. The choice of architectural strategies influenced the buildings' form and reduced peak heating and cooling loads, but was not the predominant source of redesign energy savings. The major value of the hospital redesigns may be the demonstration that energy-efficient design is possible even under constrained circumstances. 4 figures.

31291 (PNL—5123, pp 5.a1-5.27) **Energy: a class by itself.** May 1984. NTIS, PC A13/MF A01. File Number DE85003277.

In BEPS redesign of 168 commercial buildings: summary report.

Redesign examples of 11 elementary and 11 secondary schools demonstrate how the energy aspects of conventional school construction could be improved. The intermittent usage patterns inherent in elementary and secondary schools resulted in redesign decision that often increased natural lighting while minimizing conductive gains and losses. Mechanical system controls for idle spaces were also important contributors to a higher than average redesign energy saving. The redesign experiment was part of the Building Energy Performance Standards (BEPS) redesign project. 4 figures.

31292 (PNL—5123, pp 2.a1-2.27) **Energy for sales.** May 1984. NTIS, PC A13/MF A01. File Number DE85003277.

In BEPS redesign of 168 commercial buildings: summary report.

The 19 redesigned retail buildings that were part of the Building Energy Performance Standards (BEPS) project differed in terms of size, merchandise sold, mix of functional spaces, and their role in the community. They ranged in size from a 7000 square foot chain bookstore to a 671,000 square foot regional shopping center. The 26% energy reduction achieved by the retail redesign teams over the original designs is significant, but not as substantial as in other building types. A wide range of constraints influenced each of the retail redesigns, so the designers concentrated on individual building component opportunities as opposed to strategies using whole building interactions. These were primarily lighting and space conditioning systems. 5 figures.

31293 (PNL—5123, pp 3.a1-3.a5) **Dwelling with energy.** May 1984. NTIS, PC A13/MF A01. File Number DE85003277.

In BEPS redesign of 168 commercial buildings: summary report.

There was little research on the energy efficiency of multifamily buildings until the Building Energy Performance Standards (BEPS) project redesigned 25 multi-family buildings ranging in size from 17,000 to 282,000 square feet in locations that are primarily in the cold and temperate zones. The buildings encompass rental apartment, condominium, housing for the elderly, and dormitory housing. The problems encountered in treating lighting systems, appliance usage, and domestic hot water in the redesign experiment highlight the difficulty of treating multi-family buildings as a commercial type when their 24-hour occupancy resembles residential buildings. Most of the redesign changes were architectural in nature. Strategies for siting, orientations, configuration, shading, and other envelope treatment are important. 3 figures.

31294 (PNL—5123, pp 3.a7-3.57) **Bed, board, and Btu's.** May 1984. NTIS, PC A13/MF A01. File Number DE85003277.

In BEPS redesign of 168 commercial buildings: summary report.

The diversity of nursing homes, motels, and hotels represents a continuum of increasingly complex relationships between sleeping rooms and service areas. Nonhousekeeping residential designs demand a spectrum of energy strategies to handle the internally load-dominated service areas and externally load-dominated sleeping rooms. The redesign activities of the Building Energy Performance Standards (BEPS) project achieved a 30-40% energy reduction in these types of buildings, primarily by reorganizing the building form, relocating functional spaces, and using more efficient building systems and insulation. 4 figures.

31295 **(SERI/TP—251-2648) Program redesign based on reality.** Potter, T.F. (Solar Energy Research Inst., Golden, CO (USA)). Feb 1985. Contract AC02-83CH10093. 8p. (CONF-8505135—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85002937.

From 2. national utility energy efficiency conference; Oakland, CA, USA (21 May 1985).

From the perspectives of his previous position as a utility program developer/trainer and several later years of observation as program resource person at a federal lab, the author presents some quick sketches of the development of an early home energy audit program. Based on what he has learned from his experience, he makes a few suggestions for the design or redesign of current programs.

31296 **Evaluation of Minnesota utility home energy audit and retrofit loan programs.** Hirst, E.; Goeltz, R.; Thornsjo, M.; Sundin, D. (Oak Ridge National Lab., TN). *Energy Systems and Policy;* 9: No. 2, 171-195(1985). Contract W-7405-ENG-26.

Northern States Power (NSP), the largest utility in Minnesota, operates several residential energy conservation programs. This paper describes a detailed quantitative evaluation of two of these programs. The Minnesota Energy Conservation Service (MECS), Minnesota's version of the federal Residential Conservation Service, provides home energy audits and related services to eligible households. Between April 1981 and December 1982, NSP conducted almost 12,000 audits, covering 2% of its 580,000 customers eligible for the program. Loans are available to a portion of NSP's customers for installation of retrofit measures recommended in a MECS audit under NSP's Public Utility Conservation Investment Program (PUCIP). Between late 1981 and June 1982, about 450 PUCIP loans were made. 27 references, 2 figures, 6 tables.

31297 **Energy conservation to reduce summer cooling costs in Palm Springs.** Turner, R.H. (California Inst. of Technology, Jet Propulsion Lab., Pasadena, CA). pp 361-366 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Various energy conservation techniques (ECTs) which can be retrofit installed on most houses to reduce summer cooling loads are evaluated from technical and economic criteria. Palm Springs represents one of the most severe summer climates in the United States and is chosen for study. The impacts of several ECTs are considered including: insulating stud walls, insulating window shutters, shading windows, installing double pane windows, and application of reflective tint film to windows. A methodology is developed to estimate the reduction in heat gain attributable to each ECT during the summer, and also winter performance, and to estimate the dollar value in terms of reduced air conditioning bills. The annual dollar benefit attributable to each ECT for different compass orientations is estimated for 1981 residential consumer energy prices. An economic Figure of Merit (FOM) is employed to allow ranking of the candidate ECTs.

31298 **The Energy-Efficient Home Project of Oregon.** Foute, S.J.; Havener, G.; Larsen, J.; Tabachnikov, A. (Energy Institute, Lakewood, CA). pp 339-344 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The Energy-Efficient Home Project of Oregon was a joint public/private effort, involving mortgage investors, government agencies, professional associations, a lending institution, energy consultants and homebuilders in the design, construction and mortgage financing of sixteen moderately priced solar/energy conserving homes. The broad array of participants was brought together for a pilot project to demonstrate how an approach which encompasses the entire shelter industry can: create a favorable atmosphere and attractive investment vehicle for energy efficient residential construction; introduce new concepts such as a uniform energy rating system for homes and Energy Mortgage Valuation (EMV) in a context of the participants' typical business practices; result in homes built and sold; and prove in the marketplace the benefits of energy-efficient housing for all participants, from secondary mortgage market to homebuyer.

31299 **Inflatable structure in daylighting research.** Garvin, W.L. (Texas Tech Univ. Lubbock, TX). pp 153-156 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The purpose of the proposed research project is to evaluate daylighting characteristics of a variety of window and skylight configurations useful in architectural design. The proposed studies will be quantitative in nature. The subjective nature of user responses to environmental conditions are equally important in terms of user satisfaction. The need to summarize both quantitative and qualitative data is recognized titative and qualitative data is recognized in the structure of this research. In examining natural lighting through the use of architectural models, the direct sunlight characteristics are readily simulated. Diffuse daylighting studies require the use of a heliodome configuration which is typically a costly, bulky structure with significant maintenance difficulties. This project examines the potential use of an inflatable fabric structure to examine the diffuse lighting characteristics of architectural models. It will compare the simulated and natural diffuse lighting of each prototype model as well as the direct and diffuse daylighting differences.

31300 **Indirect sunlighting and skylighting: Strategies used by Alvar Aalto.** Moore, F. (Miami Univ., Oxford, OH). pp 157-162 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

A conceptual framework is presented for designer understanding of daylight illumination strategies that utilize large white surfaces as light "sources". LUMINANCE x APPARENT SIZE is proposed as a simplified conceptual design framework. A series of strategies by the Finnish architect Alvar Aalto that employ white surfaces as light sources is discussed using photographs and matching line drawings from several libraries in Europe and the United States.

31301 **Daylighting analysis for an earth covered office building in Sacramento, California.** Boyer, L.L.; Roush, R.W. (Oklahoma State Univ., Stillwater, OK). pp 163-167 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

In order to assess daylighting performance and analyze anticipated energy savings during the design process, scale models were constructed to study three key areas: (1) typical light court, (2) subterranean commons, and (3) multilevel north-facing lightwell. Following completion of the building in late 1982, on-site measurement data were obtained to compare the actual results with those obtained through modeling during design. Site conditions, at the time measurements were taken, were very close to the minimum design sky assumed for the model studies. Although some configuration and surface treatment changes were made on the constructed building, a remarkable degree of correlation between actual and simulated building performance is clearly demonstrated. The performance measures include both actual lighting levels and distribution penetration patterns. Thus, energy savings anticipated from the validated model studies might be reasonably expected to occur during actual building operation as well.

31302 **Daylighting performance documentation of two innovative low rise commercial buildings.** Hallagan, W.; Simini, V. (Princeton Energy Group, Princeton, NJ). pp 401-406 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Two low-rise commercial office schemes with design emphasis on daylighting have been documented in their ability to provide natural lighting. Illumination levels, surface luminance and auxiliary requirements of the spaces are presented. Parametric studies of design components are also presented.

31303 **Daylighting impacts of fenestration controls.** Ander, G.D.; Navvab, M. (California Energy Commission, Sacramento, CA). pp 175-180 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The California Energy Commission under a legislative mandate established and periodically updates energy efficiency standards for new buildings. Performance standards in Btu/ft^2-yr as well as prescriptive standards are being developed. Daylighting impacts were calculated using Quicklite for typical office characteristics. Although Quicklite as well as manual calculations can be modified for horizontal shading devices (i.e., equivalent room concept), vertical fenestration controls such as fins can not be easily modelled. To access the daylighting impacts of commonly used fenestration control systems, physical model testing was conducted in the Sky Simulator at Lawrence Berkeley Laboratory. Four common control strategies were selected through recommendations from a Professional Advisory Group (PAG) representing the interests of the A I A, ASHRAE, IES, and other industry groups. These devices include vertical fins with two reflectances (/rho/ =.88, /rho/ =.67), an overhang and a light shelf design with clear glass above and heat absorbing glass below the light shelf. Each of these strategies were tested parametrically with scaled models. Solar altitudes were set at 30°, 50°, and 70°. Sky conditions also varied including both overcast and clear conditions to cover most of the variables impacting daylight performance.

31304 **The neglected half of commercial daylighting design reporting: Selecting the controls, fixtures, bulbs, and ballasts.** Aitken, D.W. (San Jose State Univ., San Jose, CA). pp 181-186 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

An overview is provided of those features of electric lighting controls, lighting fixtures, bulbs and ballasts that are of practical relavance to the daylighting designer. Particular emphasis is placed on daylight controlled dimming, and on the frequent practical necessity for limiting the amount of dimming to 50% or less in the interest of economy and of permitting the utilization of a wider spectrum of available illumination schemes and hardware. Advantages of the use of dimmers independent of the complementing of daylighting are stressed. The effectiveness of air-return ceiling-mounted luminaires on lighting fixture heat collection and on bulb luminosity is presented. The status of fluorescent bulb and ballast technology is briefly reviewed, and the matching of bulbs to ballasts and to dimmers is discussed. The importance of a working knowledge of these practical concepts by the designer is emphasized.

31305 **The impact of fenstration on energy use and peak loads in daylighted commercial buildings.** Selkowitz, S.; Choi, S.; Johnson, R.; Sullivan, R. (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA). pp 187-192 of Progress in Passive Solar Energy Systems. Hayes, J.; Adrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Effective utilization of daylight is one of several design strategies that promise to provide substantial energy savings for commercial buildings. Despite the revived interest in the field, there are very few occupied buildings for which performance data verify the magnitude and cause of real savings. In order to optimize costs it is first necessary to understand building performance in sufficient detail to assess the contradictory component impacts. This can be done most effectively using an hour-by-hour energy analysis model, in this case DOE-2.1B This paper reports conclusions of an extensive series of computer analyses in two climates to determine the energy use and demand impacts of fenestration in commercial buildings. Particular attention is paid to the tradeoffs involved in using fenestration to daylight perimeter zones. The study includes the effects of climate, orientation, window area, U-value, shading coefficient, visible transmittance, lighting power density, and lighting control strategy.

31306 **A review and analysis of 24 daylighting solutions.** Neubeck, K.M. (Arizona State Univ., Tempe, AZ). pp 199-204 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Twenty-four daylighting models were designed and built by the graduate studio in energy conscious design at Arizona State University under the direction of Professor Jeffrey Cook. Each scale model represents a 9.1 x 12.2 m (30 x 40ft) office space. The models were displayed at the 1983 International Daylighting Conference; however, no documentation was presented. This paper explores the assumptions and specifics of each design in an effort to expand the library of daylighting designs available to architects and designers.

31307 **Interior design for office daylighting.** Guerin, D.A.; Mercer, R. (Miami Univ., Oxford, OH). pp 515-518 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The performance of a daylit building can be jeopardized by inappropriate interior design. The interior designer must be supplied with surface light reflectance requirements, acoustic control information, and illumination distribution requirements in order to competently specify interior components and workstation layout. The following is a guideline for the interior designer of office spaces illuminated by daylighting.

31308 **Daylighting: A general economic and energy-saving analysis.** Busch, R.D.; Scheuch, K.E. (AREA Inc., Albuquerque, NM). pp 137-142 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The energy and economic benefits available from daylighting depend upon several variables including glazing amount, glazing shading coefficient, and daylight penetration and level. In work performed for the California Energy Commission's Nonresidential Building Standards Development Project, AREA conducted an analysis of daylighting in office buildings to determine energy savings, economic benefits and life cycle costs. The goal of the analysis was to quantify the benefits and costs of daylighting within an office environment. Calculations were made for each of three California climate regions (Fresno, San Diego, and Oakland) with various shading coefficients and amounts of glazing. The results consist of a set of benefit-to-cost ratios for two different artificial lighting levels. Also presented are a series of graphs for three climate regions in California. Each graph displays building energy use as a function of shading coefficient, daylighting contribution, and amount of glass. These results can be used by the designer to evaluate energy and economic trade-offs for daylighting and glazing options in the preliminary phases of the design process.

31309 **Lens-guide viewing systems: An innovative use of daylighting at the University of New Mexico, School of Architecture and Planning.** Taschek, J.; Lusk, P.; Thomas, L. (Univ. of New Mexico Albuquerque, NM). pp 205-208 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

An optical, lens-guide viewing system has been constructed at the University of New Mexico, School of Architecture and Planning. Entirely passive, the system transmits a real time image of the Sandia Mountains through a series of lenses and mirrors into an interior design studio. The project design was modified from a system developed by M.A. Duguay and G.D. Aumiller of Bell Laboratories. The major problem to overcome was understanding the boundaries of the beam of light carrying the image in order to penetrate the building within the constraints of structure and existing use of space. Although the lens-guide concept did not originate at UNM, this project applies a natural lighting concept which has been largely ignored in solar design -- that of transmitting information. Lens-guides could be used in passive, inter-office visual communication systems, as windows providing psychologically needed contact with the outdoors, or for purposes as yet not conceived.

31310 **A graphical method for determining interflected daylight in clear climates.** Robbins, C.L.; Hunter, K.C. (Solar Energy Research Inst., Golden, CO). pp 131-136 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This report presents an extension of the daylight factor method of analysis that includes a graphical method for determining interflected light in clear climates. The interflected component of daylight, called the internal reflectance component (IRC), has been determined for overcast skies in research performed in the United Kingdom. The technique developed by the Building Research Establishment in the United Kingdom is based on determining an average IRC for a given room or space. Using a daylight availability model developed at SERI (1), we established a similar average IRC analysis technique for clear skies. The results of applying the SERI daylight availability model suggest that a critical element in determining the IRC under clear sky conditions is the ratio of global to diffuse (G/d) illuminance on a horizontal surface. This graphical technique for determining clear sky IRC values is expected to enhance the accuracy of daylighting system design by simplifying the format used in clear sky computation.

31311 **Solar and internal gain adjustments in calculation of energy conservation savings.** Christensen, C.B. (Solar Energy Research Inst., Golden, CO). pp 111-116 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Heating degree days are often used as a climatic measure in building energy calculations. To account for the effects of solar and internal gains, degree days at a lower base temperature are sometimes used, or the number of degree days is adjusted downward by a degree-day correction factor. In this paper, the authors present a theoretical derivation which demonstrates that ASHRAE C /sub d/ factors are not the appropriate correction factors for calculation of energy savings from envelope conservation measures. The results of this derivation can be used to develop new correction factors appropriate for savings calculations.

31312 **Development of an integrated daylighting design methodology.** Bryan, H.J. (MIT, Cambridge, MA). pp 147-152 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper describes six daylighting calculation procedures that the author has been involved in developing over the last several years. They include: sky vault projection, tabular, graphic, protractor, programmable calculator, and microcomputer procedures. After analyzing each, the author finds that they all lack important qualities that would encourage their successful integration into the daylighting design process. A counter model is then proposed where the daylighting procedure becomes part of a learning experience which can integrate with the design process in a natural way and where the designer can exercise his of her knowledge and experience.

31313 **Application of modified degree day procedures to a residential rating system.** Michal, C.J.; Fuller, W.H. (EQUINOX, Inc. Peterborough, NH). pp 555-560 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The authors have developed a residential energy efficiency labeling program for the Commonwealth of Pennsylvania. Users of the program determine energy efficiency using a printed brochure (known as the Home Energy Scorecard). This paper discusses the procedure used in the calculation of the major point values used to establish home scores. A projected 1,000 Btu of annual savings in energy demand was assigned a scorecard value of one "point." Points are achieved by substituting a given energy conserving technique (ECT) for uninsulated wall, ceiling, and floor construction or for the single glazing assumed for the reference case. Points determined for each ECT differ among seven house types and four climate zones. Points were also determined for ECTS involving infiltration control, passive solar heating, domestic hot water use and heating system equipment.

31314 **Educational tool for quick and accurate daylighting analysis.** Dwyer, L. (ENSAR Group, Lakewood, CA). pp 647-652 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

An educational/design tool using a microprocessor based, multiple-cell photometer has been developed by the ENSAR Group for the analysis of daylighting schemes in both physical models and actual buildings. Unique aspects of the system are its ability to produce instantaneous CRT display and hard copy graphic output which provide the student/ designer with quick feedback concerning the light distribution in the space. A physical model of a building design can be tested and then modified to learn the effects of any number of building parameters on the daylight level and distribution in the space. This is perhaps the most effective way to learn about daylighting design concepts because it instantly shows the cause and effect relationship between building design parameters and daylight levels. The system can also be programmed to act as a data-logger in order to monitor light levels over long periods of time (i.e., days or weeks) and store the data on magnetic tapes for later retrieval, plotting and analysis. This paper describes the ENSAR Daylighting Analysis System, as well as illustrating its application with an example design problem.

31315 **"Light Plenum" concept in office building design.** Mirkovich, D. (Washington State Univ., Pullman, WA). pp 168-174 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Through the use of modelling, the "Light Plenum" concept was investigated to determine daylighting patterns in office building design. This concept is merely an extension of the light shelf application, or an enlargement of the conventional mechanical plenum to form a light trap. The trapped light reflected within the plenum is transmitted into the office space through a translucent ceiling pattern integrated with the electrical lighting system. Under sky conditions for the Pacific Northwest, the recorded results taken at

Pullman, Washington indicate that the translucent ceiling with daylighting controls will allow adequate, uniform task lighting levels. This daylight contribution for task lighting could allow a significant reduction in electrical lighting demands in office building design.

31316 **The effect of thermal mass in exterior walls on energy consumption in commercial buildings.** Wilcox, B.A.; Blyholder, A.G.; Gumerlock, A.; Mitchell, R. (Berkeley Solar Group, Berkeley, CA). pp 733-737 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

DOE2.1A building analysis of prototypical office buildings completed for the California Energy Code has shown that increased heat capacity of exterior walls allows equal annual energy performance with reduced thermal resistance. Based on this work, the California Energy Commission has adopted a set of prescriptive standards, in which the required insulation level depends on wall heat capacity. An optional package of conservation measures which allows uninsulated masonry walls by increasing ceiling insulation and reducing lighting energy is also presented.

31317 **The Wall Report- A "value insulation" approach to determining the cost effectiveness of residential wall construction.** Kaple, K.S.; Kidd, C.D. (Miami Univ., Oxford, OH). pp 749-753 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper addresses many of the misconceptions associated with superinsulated walls and proposes a "value insulation" approach for determining the cost effectiveness of residential wall systems. The thesis of the paper is that homeowners, builders, and architects often do not clearly understand the benefits and total real costs of superinsulated wall construction. It becomes necessary therefore, to point out that "superinsulation" is not always "value insulation". "The Wall Report" was prepared by Miami University's Department of Architecture, in Oxford, Ohio. It provides some necessary background information on superinsulated construction, and a simplified worksheet procedure to analyze the cost effectiveness of various wall systems. Through the descriptions given for different wall framing approaches and the use of the worksheets, the most appropriate type of construction and the proper amount of insulation can easily be determined.

31318 **Ground temperature profiles for selected New Mexico locations.** Farrer, R.; Polka, R.; Selinfreund, M. (New Mexico Solar Energy Inst., Las Cruces, NM). pp 317-320 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Earth-sheltering techniques can provide considerable savings in the energy used for the heating and cooling of buildings. These savings are due to the reduction in heat losses from earth-sheltered buildings in winter and to the reduction in heat gains to buildings in summer. To evaluate the potential thermal benefits due to earth sheltering, information about the variation of earth temperatures with depth (below the surface) and with the time of year is required for the proposed building location. Information of this nature is not currently available for locations in New Mexico. In this paper, an existing mathematical model for ground temperatures is used to generate predicted ground temperature profiles for selected New Mexico locations. Information on local temperatures (from existing long-term weather data) and local soil conditions is used in the model to predict ground temperatures as a function of depth and time of year. Predicted ground temperature profiles are compared with the few ground temperature measurements that are available.

31319 **Linear regression techniques in analysis of the Blouin superinsulated house.** Hagan, D.A.; Jones, R.F. (Brookhaven National Lab., Upton, NY). pp 259-264 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Brookhaven National Laboratory, as part of its small building field validation program, gathered hourly data from the Blouin superinsulated house in South Royalton, Vermont, during March, April, and May, 1982. Least squares linear regression techniques came to be seen as one of the most valuable and powerful tools available for data analysis. Development of the models used and regression results obtained are presented for three major sub-systems of the house: the airto-air heat exchanger system, the window and insulating shutter assemblies, and the building envelope.

31320 **Energy-conscious design features for New California State Office Building - Site 1-C.** Bryan, H.; Bazjanac, V. (MIT, Cambridge, MA). pp 1023-1028 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Sociaty Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper describes the energy-conscious features used in the design of a new 160,000 square foot California State Office Building (Site 1-C). The building represents an integration of a series of simple and proven energy-conscious design concepts that contribute to an extremely energy efficient end result. Covered are implications in building configuration, office space layout, fenestration and shading device design, and electric lighting/control alternatives. The various energy-conscious design features considered are discussed and particular solutions highlighted.

31321 **San Pasqual Battlefield State Historic Park- An Earthbound Visitors' Center.** Keniston, S. (Keniston & Mosher Architects, San Diego, CA). pp 1017-1021 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The State of California for the last several years has actively supported the design and construction of particularly energy conscious buildings. This policy has been embraced by the State Parks and Recreation Department. Firms with backgrounds in "energy design" from throughout the state were interviewed for this project which had two basic requirements: 1. Design a culturally sensitive facility preserving archaeological sites within a 50+ acre tract and provide an interpretive display showing three cultures involved in an important historic battle. 2. Develop an energy program that would significantly reduce operation costs in an all-electric, inland valley near San Diego. This paper presents the generally more important overall design development issues as they relate to the energy program which culminated in an on-site budget of 8,500 Btu/ft^2/yr. Major features include earth integrated structure; wind scoops for venting; nocturnal cool-down; hybrid "breadbox" space heating; high-efficiency lighting (HPS and dimmable fluorescent); motion sensors; point-of-use and passive DHW; water conservation (ultra-low flush toilets-2 quarts and indigenous landscaping); and rammed earth walks and drive.

31322 **Daylighting, dimming & design.** Scully, D.V.; Fuller, W.H. (EQUINOX, Inc., Peterborough, NH). pp 971-976 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Two EQUINOX, Inc. designed institutional classroom buildings have recently been built. In addition to super-insulation, the major energy conservation feature is perimeter and ridge line daylighting with automatic dimming of the lighting systems. The Swartley Music and Arts Center, Dwight-Englewood School, Englewood, NJ, is a 7,500 ft^2 renovation of an existing 2-story abandoned gymnasium building with a long quadruple-glazed "Kalwall" skylight providing high quality natural light to the second floor studios. A "Lutron" automatic dimming system is provided. The graphical daylighting design method developed at the University of Washington (Millett, M.S.) was used as a design tool. The New England Regional Wastewater Institute building, South Portland, ME, is a new 2-story 9,000 ft^2 classroom and laboratory addition. High and low perimeter double-glazed windows with intermittent skylights provide daylighting deep within the various classrooms. "Lutron" automatic dimming systems are provided for the classrooms and a site-built photoelectric dimming system is used to control the corridors and stairwell lighting. A 1/2 in. scale model and light meter, as well as the daylighting factor method using the QUICKLITE computer program was used in the design process. This paper discusses both buildings, the design process and the daylighting design tools used.

31323 **The Timberloft: A superinsulated house for cold climates.** Hansen, C.W.; Corbett, R.J. (Corbett/Hansen Assoc., Butte, MT). pp 915-920 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

As a logical extension of research in passive solar space heating technology, "superinsulation," (or, as William Shurcliff once suggested, "micro-load passive solar") is emerging as a simple, cost-effective building technology for cold-climate residential design. The transfer of superinsulation technology to the mainstream of new home construction requires detailed construction drawings for those building this type of housing for the first time. This paper presents and discusses the design rationale, significant architectural detailing, integration of an air-to-air heat exchanger system, and estimated construction costs of an architecturally attractive superinsulated house, the plans for which the authors are marketing by mail order. Computer simulations indicate that this house, if located in Great Falls, Montana, (7652 degree days) can be heated for $118. per year using electric heat at $.0295 per kWh.

31324 (CONF-8009327—, pp 1-13) **Alternate fuels for maritime use.** 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

The Maritime Transportation Research Board of the National Academy of Sciences has completed a review of alternative fuels for the maritime industry. Twenty different fuels and energy sources were evaluated, with detailed consideration given to coal, coal/slurries, synfuels from coal, shale and tar sands, alcohols, and gases (methane and hydrogen). Application of these fuels were considered in diesel, steam and gas turbines for deep sea operations and for inland waterways. Wind and nuclear were considered as alternative energy forms. The fuels that have a high probability of commercial development for existing ships are synfuels from shale, coal or tar sands, while for new ships coal and coal/oil slurries are also possible candidates in addition to the synfuels. Coal is the primary alternate marine fuel and every effort should be made to implement its use.

31325 (CONF-8009327—, pp 15-45) **Re-engining of a VLCC with low-speed geared diesel engines.** Michiura, T.; Kozai, D.; Vragel, P. (Mitsui Engineering & Shipbuilding Co., Ltd., Tokyo, Japan). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

The reengining of turbine powered VLCC's has in the past been accomplished using medium-speed geared diesel engines. The major reason for this is that medium-speed diesel engines of the required output range can normally be installed in existing engine rooms without involving substantial changes in the hull construction or the arrangement of auxiliary machinery and equipment. With the existing engine room arrangement of the Amoco Seafarer, it has been possible to incorporate slow speed diesel engines with lower fuel oil and lube oil consumption and lower maintenance costs than medium speed engines of equivalent output. The conversion of the Amoco Seafarer from steam to diesel will be carried out at Mitsui's Yura yard beginning in June, 1980. The design philosophy and principal technical details involved in the conversion are discussed.

31326 (CONF-8009327—, pp 47-71) **Ways to reduce slow steaming fuel consumption of steam turbine machinery through technical modifications.** Rein, H. (Det Norske Veritas, Oslo). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

Over the past 5-6 years slow steaming has been a rather common mode of operation for a large number of ships, particularly ships with high propulsion power. The underlying cause of this has been a very large rise in bunker fuel prices since 1973-1974, while charter rates at the same time in general have stayed quite low. A study has been performed of some select configurations of steam turbine machinery to determine what fuel savings can be obtained, particularly at part load, through changes in method of operation or through technical modifications that for the most part are relatively moderate. Results are presented in the form of percentage fuel savings and in terms of cost savings. The savings may range from 0.5% to 10%. With fuel oil prices at its present high level, a fuel reduction of only 0.5% may represent a large annual cost saving well worth making an effort to achieve.

31327 (CONF-8009327—, pp 73-91) **Comprehensive program for shipboard energy conservation.** Sweeney, J.J. (Matson Navigation Co., San Francisco, CA). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

One steamship line's successful energy conservation program is discussed. The development of a new staff position by senior management and the actual role of the energy conservation manager are explored in detail. Specific vessel design and operational deficiencies are described as discovered and corrected. A program of capital expenditures to reduce vessel fuel consumption, covering all aspects of both marine engineering and operations is then outlined. Bunker availability, price, and quality trends are reviewed and related to overall technical and economic considerations. Finally, the results of the first twelve months of this program are summarized and related to future benefits to be derived from studies presently in progress.

31328 (CONF-8009327—, pp 93-109) **Considerations in establishing a speed performance monitoring system for merchant ships - Part 1.** Logan, K.P.; Reid, R.E.; Williams, V.E. (Univ. of Illinois, Urbana). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

The rapid escalation in the price of fuel oil and a substantial over-capacity in available tonnage of the world's merchant shipping have combined to cause a major problem in the maritime industry. Much effort has been devoted to improve efficiency of ship, bridge, and propulsion systems. The principal areas of fuel losses occurring during the operation of a ship in the open seas have been shown to be in the following four main areas: (1) power plant and auxiliaries, (2) propeller efficiency, (3) hull resistance, and (4) navigation and steering. Individual fuel savings credits for the various areas of losses have been shown to interact with one another when consideration is given to overall potential fuel savings achievable. Estimates of the increase in fuel consumption on poorly maintained ships, based admittedly on a relatively small sample of ships, have been placed in the range of 5 to 10% attributable to steam turbine power plant, 10 to 25% to hull and propeller degradation effects, and 5 to 10% from various other causes. The separation of these losses, one from the other so that remedial action may be taken is no small task. Identification of losses and their correlation with a particular effect has been shown to be achievable through the use of performance monitoring techniques. These techniques are described.

31329 (CONF-8009327—, pp 110-134) **Part II - techniques based on propeller relationships.** Logan, K.P.; Reid, R.E.; Williams, V.E. (Univ. of Illinois, Urbana). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

Part I of the paper was directed to formulation of the problem of in-service speed performance measuring/monitoring of ships and development of a relatively simple onboard microcomputer based speed performance monitoring system using multiple regression techniques. Performance monitoring techniques based on the implicity propeller/propulsion relationships of the generalized power diagram are discussed in Part II. An examination of the accuracies of various methods of calculation of power correction using the relationships of the power diagram is carried out using service data for the Sea Barge Clipper S. S. Almeria Lykes for four voyages across the North Atlantic in the Spring and Summer of 1979. Based on these analyses and those resulting from the use of the statistical techniques of multiple regression and smoothing, an approach is taken to performance monitoring which attempts to combine these techniques using both model and trials data. An attempt to demonstrate how the several shortcomings of these various techniques can be overcome, hopefully, by development of an onboard speed loss identification system based on existing concepts is discussed.

31330 (CONF-8009327—, pp 135-150) **Monitoring speed and power for fuel economy.** Townsin, R.L.; Svensen, T. (Univ. of Newcastle upon Tyne, England). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

General principles are outlined for monitoring the speed and power performance of ships in service. An example of monitoring is given to illustrate the method and value of applying the principles. The example compares the performance of two sister containerships for which speed power curves were measured during a round voyage. The difference between the two speed and power curves is related to the hull roughness. The energy expenditure per nautical mile is calculated for the two ships. It is shown that hull roughness costs the operator $6000 per annum per micrometre. Problems of monitoring performance using fuel figures are illustrated and the use of torsionmeters and satellite navigators is considered essential. The optimum speed of the ships is calculated.

31331 (CONF-8009327—, pp 151-166) **Some aspects of fuel economy in bulk carrier design and operation.** Scher, R.M.; Benford, H. (Univ. of Michigan, Ann Arbor). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

Near-term solutions to the impact of higher fuel costs on the design of bulk carriers and strategies for fleet operation are discussed. Analytical techniques are proposed that recognize the inventory cost of the goods in transit as well as the economics of the ship itself. As an illustration of the proposals, the results of a study to determine the best combination of design speed and block coefficient for a bulk carrier of Panamax size under various levels of fuel price are shown. A section on fleet management proposes a method for selecting the most fuel-efficient plan for operating a fleet of ships during conditions fo fuel shortage or unforeseen rises in price.

31332 (CONF-8009327—, pp 167-181) **Energy conservation consideration in CVV hull form design.** McCallum, D.; Byers, D.; Fleming, J. (Naval Ship Engineering Center, Washington, DC). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

As a result of the current energy shortage, the US Navy has been conscientiously examining various means to more efficiently use the available energy resources. Naval ships consume the equivalent of 78 million barrels of oil each year. During the recent design of a mid-sized, fossil-fueled aircraft carrier (CVV), the Naval Sea Systems Command (NAVSEA) used several new methodologies and techniques in order to design an energy efficient hull form. Model tests were performed with three different hulls, both with and without bulbous bows, and the powering data thus obtained were analyzed by computer on the basis of the ship's speed-time profile and specific fuel consumption data. The three hulls were comparatively evaluated using a rational hull form selection technique which addresses annual fuel costs in addition to traditional naval architectural considerations. It is shown that considerable savings in fuel costs can result from this approach.

31333 (CONF-8009327—, pp 181-198) **Prospect of sail-equipped motorship as assessed from experimental ship Daioh.** Ishihara, M.; Watanabe, T.; Shimizu, K.; Yoshimi, K.; Namura, H. (Nippon Kokan K.K., Tokyo, Japan). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

An approach to the realization of a sail-equipped motorship is suggested based on the results obtained from wind tunnel tests, on-shore tests and sea trials of the experimental-ship Daioh conducted by the joint efforts of Nippon Kokan K.K. and the Japan Marine Machinery Development Association. Much technical data on sail performances was obtained through systematic wind tunnel tests. The sailing equipment was first mechanized to meet the various requirements, installed on board Daioh, and tested, and a power gain estimation method was verified by the sea trials. The economical aspects of a 10,000 ~ 35,000 DWT Bulk Carrier were also studied by utilizing the power gain estimation method. This then is a report on the successful termination of the first stage in the development process.

31334 (CONF-8009327—, pp 199-205) **Ship weather routing.** Dooley, A.L. (Oceanroutes, Inc., New York, NY). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

Oceanrouting is the science of applying meteorological and oceanographic data to the transocean crossing of a specific ship by allowing the Master to take advantage of wind, sea, swell, and current conditions. The skills of marine weather forecasting and the principles of ship performance analysis has allowed the marine industry to reduce underway times for their ships while optimizing fuel usage and minimizing cargo and hull damages. In order for the techniques to be successful and show fuel savings, each ship must be given initial route recommendations, subsequent diversions, pertinent weather advisories, and performance evaluations of ship speeds. Some of the fundamentals of oceanrouting which must be applied in order to achieve the fuel conservation advantages of weather routing at sea are described.

31335 (CONF-8009327—, pp 207-217) **In-service roughness allowance: effects of drydocking, recoating and the passing of time.** Hamlin, N.A.; Sedat, R. (Webb Institute of Naval Architecture, Glen Cove, NY). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

A historical survey is given of traditional methods used in predicting the performance of a new ship design on the basis of a correlation allowance and model tests together with a power margin. A method of logbook analysis is presented next, allowing one to find a service roughness allowance, directly analogous with the correlation allowance, by which one may assess the effect of fouling and surface degradation of the ship as time out of drydock passes. The logbook analysis is then applied to a break bulk ship over three drydocking cycles, and to a containership during one drydock cycle. The resulting service roughness allowance, and change in wake fraction, are then used to predict the smooth water performance of the ship in service, at any draft and power level.

31336 (CONF-8009327—, pp 219-241) **Hull roughness, antifouling coatings and ship performance.** Hartley, R.A. (International Paint Co., Inc., Union, NJ). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

Hull roughness has an appreciable effect upon the flow of sea water over the underwater hull. Its relationship with skin friction and the boundary layer is briefly discussed. Hull roughness can be divided into micro and macro roughness factors; the former includes steel and paint profiles whilst the major component of the latter is biological fouling. Average hull roughness readings have been determined for a large number of vessels and the economic effects have been outlined. The performance of conventional antifouling paints shows serious limitations in expected life due to exponential decay in leaching rate and in the development of microroughness due to the leaching mechanism. In addition intercoat adhesion of subsequent costs of paint is generally poor leading to peeling and macro-roughness. The newly developed organotin copolymer antifoulings operate by a different mechanism with essentially a straight line leaching rate/time relationship, hence giving an appreciably longer life. In addition surface smoothing also occurs.

31337 (CONF-8009327—, pp 243-249) **Effectiveness of waterborne hull cleaning of aircraft carriers.** Hering, F.S. (Naval Air Station, San Diego, CA). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

Headquarters Naval Air Force Pacific (COMNAVAIRPAC) has pursued an aggressive hull cleaning program since 1978 for the six aircraft carriers (CV) assigned. Extensive data has been taken based on ship's performance as well as on underwater hull and propeller inspection. Fouling rates for CV's operating in both warm and cold waters have been determined. Correlations of shaft horsepower vs. first stage turbine pressure and of fuel savings vs. speed are examined. Behavior of USS Midway in rapid refouling after cleaning is analyzed. A cost-effective cleaning interval for CV's has been determined and is considered along with other factors affecting the when to clean decision. A fuel savings of 15% over an entire five-year CV overhaul cycle is predicted. Comprehensive analysis of USS Ranger data is conducted, quantifying the benefits of cleaning and hull preservation. The data on Ranger also indicates that longitudinal trim may have a measurable impact on hull resistance and should be controlled when operationally practical. Observations of hull preservation and roughness of USS Constellationa nd her sister ship USS Kitty Hawk are discussed in light of consistently higher (approximately 14%) fuel consumption by USS Constellation, even with both ships in the clean hull condition.

31338 (CONF-8009327—, pp 251-279) **Marine steam power plant alternatives in the degrading fuel quality and increasing price environment.** Schroppe, J.T.; Niatis, U. (Foster Wheeler Boiler Corp., Livingston, NJ). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

Residual oils, along with escalating prices, are progressively degrading in quality. This is occurring and will continue to occur due to increased demands on refineries for more distillants from a given barrel of crude oil. Degraded residual oils can be utilized by a steam propulsion plant. The present design marine boilers will accomplish this with slight increased maintenance and new boilers can be designed to maintain or lower present levels of maintenance. The various aspects of burning this degraded fuel are addressed, and design considerations for accommodation of this fuel for new construction are given. The present and future price of residual oil coupled to degradation of its quality introduces the alternate of coal burning which is viable from practical and economic considerations. Information on a coal burning boiler and a proposed plant is given. A comparison of the economics of this plant to an oil burning plant is made, plus a diesel plants fuel costs are given to emphasize the obvious cost advantage of coal.

31339 (CONF-8009327—, pp 281-295) **Coal-fired boilers for the 1980's.** Horlitz, C.F.; Sabo, S.E. (Combusion Engineering, Inc., Windsor, CT). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

Since 1973, greater emphasis has been placed on the operating costs of vessels, particularly fuel costs. The rising prices of fuel oils have caused significant re-evaluation of the horsepower required for a given vessel. The availability of specific types and qualities of fuels is also of significant concern. An alternate fuel which is abundant and can be burned aboard ships is coal. A brief history of the development of marine boilers is presented, various method of firing coal are discussed, and a modern coal fired marine boiler and certain of its associated equipment are described. Also discussed are boiler design criteria that the boiler designer must consider when firing coal vs. oil.

31340 (CONF-8009327—, pp 297-315) **Design of coal-fired steam power plant for a containership.** Femenia, J. (SUNY Maritime College, Fort Schuyler, NY). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

The design of four coal fired steam power plants including the required fuel storage and fuel handling systems was undertaken by the Marine Engineering Class of 1980 at the State University of New York Maritime College. The designs are based on the container ship version of the MarAd PD-214, Multi-Purpose Mobilization Ship. In addition to the summary of the system and component designs, a summary of the economic analysis is included. The conclusion drawn from the study was that modern coal fired ocean going merchant ships are technically and economically viable.

31341 (CONF-8009327—, pp 315-330) **Study of local roughness effect on ship resistance for effective cleaning and protection of hull surface.** Baba, E.; Tokunaga, K. (Mitsubishi Heavy Industries, Ltd., Nagasaki, Japan). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

Protection of ship hull surface from fouling is one of the essential means to reduce the fuel oil consumption. For economical and effective cleaning and protection from fouling it is important to know the most effective location of hull surface in cleaning and protection with respect to reduction of ship resistance. In the present study, the resistance tests were made for a bulk carrier model and tanker models which were roughened artificially. The tests were made varying the roughened part systematically in lengthwise divisions. As a result it was found that the effect of the first quarter length of a ship is significantly larger (above 40%) among them. Some theoretical considerations which confirm the experimental results were made based on the turbulent boundary layer calculation for smooth and roughened hull surfaces.

31342 (CONF-8009327—, pp 331-342) **Propellers for economy.** Sinclair, L.; Eames, C.F.W. (Stone Manganese Marine, Ltd., London, England). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

A marine propeller is normally designed to satisfy a number of often conflicting requirements and its efficiency, although important, has hitherto rarely been given highest priority. In the present circumstances when fuel prices and energy conservation are of paramount importance, it is believed that a re-appraisal of priorities is called for, placing emphasis on measures to improve the propulsive economy. Increased propeller efficiency can sometimes be achieved with significant gains, although in some cases a diminution of margins and provisions in relation to other aspects of performance may be involved. Although these remarks apply to the design of new ships, in the case of existing vessels, a much more cogent case can be made for improvement, as almost invariably ship's logs reveal that following years in service, the operating conditions are remote from from those for which the propeller was designed. Improvements of a significant order can be achieved and this is particularly the case if, for reasons of economy, an owner has decided to use a reduced operating speed. Advantage can also be taken at this stage of new propeller techniques, as the condition of the existing propeller may have deteriorated to some extent. The possibilities in relation to propulsive economy under the changing conditions are discussed.

31343 (CONF-8009327—, pp 343-360) **Evaluation of various types of nozzle propellers and reaction fin as the device for the improvement of propulsive performance of high block coefficient ships.** Takekuma, K. (Mitsubishi Heavy Industries, Ltd., Nagasaki, Japan). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

Improvement of propulsive performance of ships has been considered to be one of the most effective items for power saving. In addition to the constant effort to design hull forms with better performance, various types of propulsion devices retrofitted to the existing ships have been considered to have promising improvement of ship propulsive performance. Experiments were made for VLCC models of different shapes of afterbody with the same kinds of propulsion devices, namely nozzle propellers including modifications and a reaction fin. Quantitative evaluations of each device with respect to propulsive performance were made. As a result it was found that the reaction fin is the most effective device among the retrofitting devices examined.

31344 (CONF-8009327—, pp 361-375) **Slurry fuels: the retrofittable alternative.** Winkler, M.F. (Seaworthy Engine Systems, Inc., Essex, CT). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

With the uncertainty of supply and escalating fuel oil costs, serious consideration should be given to slurry fuel retrofits to reduce oil imports, reduce steamship operating costs, and to better use our natural resources. Slurry fuels remain to be the only viable, bunkerable and retrofittable fuel type for the existing steam fleet. While new ships can be most economically designed for direct coal burning, conversion to direct coal firing is not considered to be practical nor economically feasible. In order to bring marine slurry technology to a successful conclusion onboard existing vessels typical of modern design, three major areas of technical concern are: (1) shoreside processing, (2) onboard storage stability, and (3) satisfactory combustion related aspects. Use of as much of the vessel's existing tankage, fuel handling, and combustion systems minimizing extensive retrofit costs maximizes the economic gain that results from the use of such an alternate fuel. From limited laboratory and field test work it appears that shoreside processing plants can be built and properly sited, stabilization techniques can be practically applied, and complete carbon burn out can be achieved in boiler furnaces. This preliminary technical feasibility may join the economic attractiveness to make this category of marine fuel one of the best potential alternate fuels for this country's existing steam powered fleet of 500, or so, vessels.

31345 (CONF-8009327—, pp 377-390) **Prototype steam plant with fluid bed designed for uncertain energy conditions.** Albino, J.A.; Svensson, J.E. (Stal-Laval, Inc., Elmsford, NY). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

The future availability, quality, and price of marine bunker fuels are extremely uncertain, and may involve economic risks far beyond the average business risk. The Very Advanced Propulsion (VAP) turbine plant has been developed with special consideration to this, aiming at low initial investment and low operational life cycle costs. It offers low fuel consumption, combined with the capability to burn cheap residual fuels, and keeps other fuel options open for the future. Some innovations are described, one of which is the application of fluid bed combustion. A five year test program has been completed including operation of a fluidized bed superheater installed at a Swedish power station during two winter heating seasons. The economic competitiveness of VAP is evaluated using ship life cycle study analysis with both oil and coal as fuel. These evaluations indicate a promising future for the burning of low quality fuel oil and a good prospect for burning coal as the full fluid fed is developed. This technology offers the possibility to improve the economy of existing ships by rebuilding existing turbine plants. The first VAP engine, which is considered a progression in steam propulsion machinery, is presently under manufacture, with new modularized components and auxiliary systems.

31346 (CONF-8009327—, pp 391-410) **Effective energy saving for motor ships.** Yokoyama, J.; Yamada, T. (Mitsubishi Heavy Industries Ltd., Tokyo, Japan). 1980. Society of Naval Architects and Marine Engineers, 1 World Trade Center, Suite 1369, New York, NY 10048. File Number TI84009461.

From Shipboard energy conservation '80 symposium; New York, NY, USA (22 Sep 1980).

After a comprehensive study on the feasibility of various kinds of working media including organic media, water has been finally selected as the most suitable working medium for Rankine cycle plant of waste heat recovery on board motor ships from a practical point of view. Hence, efforts to optimize the steam bottoming plant have led to the adoption of the duel steam pressure system, where the recovered electric power generation can be increased by 20 ~ 30% more than that of a conventional single steam pressure type system. The system is designed to recover the main engine exhaust gas heat solely in order to simplify the system configuration and operation. Seventeen (17) sets of the system have been completed by May, 1980 and are running satisfactorily at sea. In addition, thirty eight (38) sets are on order. Several other improvements are newly proposed to be added to the present system to make it more effective in energy-saving and widen its application.

31347 **(ORNL/TM—9608) DOE National Rideshare Program Plan.** Southworth, F. (Oak Ridge National Lab., TN (USA)). May 1985. Contract AC05-84OR21400. 86p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85013543.

This document describes a three-year plan, as developed for the US DOE National Rideshare Program: a research and technology transfer program with the goal of encouraging more commuters to share their vehicles when traveling to and from work. The Plan is the result of an extensive nationwide review of current ridesharing benefits, barriers and activities, and describes an approach to: educating the nation's upper and middle management to the benefits of company-based carpooling and vanpooling, and to promoting the energy and financial benefits of capital investment in rideshare enhancing facilities. The Plan emphasized the means for collecting the information necessary to a successful rideshare marketing campaign, as well as the lines of communication through which the program's research findings will be disseminated.

31348 (PB—85-159838/XAB) Alternative technology for transit-bus air conditioning: the rotary-screw compressor. Final report 1981-82. Perez, D. (Department of Transportation, Cambridge, MA (USA). Transportation Systems Center). Nov 1984. 40p. (DOT-TSC-UMTA—84-29). NTIS, PC A03/MF A01.

This report summarizes the results of the test and evaluation of a prototype rotary-screw compressor design. The UMTA-funded RandD program consisted of two phases. The objectives of the first phase were to ascertain the extent of the problems with current bus air-conditioning systems and to determine the feasibility of adapting alternative compressor technology for use in transit buses. This work was carried out by the (Garrett) AiResearch Manufacturing Co. of Torrance, California and Dunham-Bush, Inc. of W. Hartford, Connecticut and has been documented in UMTA Report No. CA-06-0145-80-1 (NTIS No. PB-215-502). The second phase was to test a prototype alternative compressor under a wide range of simulated, and actual, bus revenue service environmental conditions and was also conducted by Dunham-Bush, Inc. It is the results of this effort that are documented in this report.

31349 (AECL—8101) Rearing of fish and selected freshwater organisms in heated effluent. A Canadian perspective. McMahon, J.W. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). May 1983. 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701473.

Utilization of waste heat emitted from thermal generating stations is shown to increase the winter growth rates, particularly of salmonids, from near zero to optimum without costly heating of water. A reasonable economic efficiency can be achieved at site specific stations, rearing fingerling rainbow or speckled trout to marketable size. For some consumer accepted species the technology at the international level is well ahead of its effective application. The present need is to transfer laboratory-scale research to pilot-scale units. High initial capital costs necessitate financial collaboration between the aquaculturist and the government.

31350 (BFR-R—10-1984) Industry's energy demand for space heating. Sahlin, C.; Nilsson, E.; Holmqvist, R.; Johansson, M.; Joensson, O. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1984. 146p. (In Swedish). NTIS (US Sales Only), PC A07/MF A01. File Number DE85750837.

24 various industrial branches are reporting their energy use. This survey of energy use for heating purposes points out the possiblities to recovering waste heat. Only 7 branches use more than 10 % of recovered heat for space heating. The branches which have been investigated are divided in three groups, namely such as using waste heat both from processes and space heating, those using waste heat from space heating and finally branches which are process intensive. The first group includes food and textile industry, chemical and rubber industries. The second group requires energetic ventilation and includes building materials, furniture and potteries. The share of space heating of the total energy use of the third group is negligible. In this branch we find sugar, pulps and cement as well as metal industries. The importance of finding out the chances to reduce the total cost of energy is indicated.

31351 (CONF-8406252—75) High temperature heat pumps for industry. Session 4 N.4.6. Hodgett, D.L.; Witt, J.A. (Union Internationale d'Electrothermie (Sweden)). 1984. 20p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751763.

From 10. UIE congress on electroheat for improved economy; Stockholm, Sweden (18 Jun 1984).

The paper describes the possible types of applications for high temperature heat pumps and the technical options available for matching the heat pump to the industrial process. The criteria for the economic viability are explored and the target values for success are specified. The logic behind the search for the most appropriate applications in different industrial sectors is explained and the necessary efforts to achieve a successful transfer of technology are illustrated by the example of a high temperature heat pump for timber drying which is now in commercial operation.

31352 (DOE/CS/40091—T14) Energy conservation opportunities implemented by small and medium-size manufacturers. EADC Program, 1981-1983. Kirsch, F.W.; Deevy, L.M. (University City Science Center, Philadelphia, PA (USA)). May 1985. Contract AC01-78CS40091. 40p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012979.

The 479 small and medium-size manufacturers served by the Energy Analysis and Diagnostic Center program during 1981-83 implemented 1782 energy conservation opportunities (ECOs) that had been identified in their plants. By doing so they were able to save over $11.25 million/year of their energy costs and to conserve more than 1822 billion Btu/year of their energy use. Those quantities represent 72.6% of the potential savings and 74.8% of the total conservation identified by the five EADCs that performed energy audits in these plants. This report presents the first overall analysis of the 1782 ECOs implemented, although previous reports have discussed portions of them. They are examined at different levels of detail, according to the energy sources involved, the categories of energy use affected, and the industries where they occurred.

31353 (DOE/CS/69096—18) Energy Management Manual for dairy processors. (Purdue Univ., Lafayette, IN (USA)). 1985. Contract FG02-80CS69096. 255p. NTIS, PC A12/MF A01; 1; GPO Dep. File Number DE85012313.

The Small Manufacturer and Food Processing Energy Management Program was an information development project focused on energy management for dairy processors. The goal was to improve the quality and relevance of energy conservation practices as they relate to production of dairy products in a manufacturing and processing plant. The information development involved two thrusts carried out concurrently: (1) Development and publication of an energy management manual to increase understanding of plant management, operation, and process personnel concerning energy conservation and management in dairy processing, and (2) Development of a series of computer programs to aid in the analysis of present plant performance and project alternate production processes and plant operation schemes. Use of the programs results in process schematics, an energy balance and a basis for cost estimates.

31354 (DOE/R1/21267—T1) Bypass filtration of cooling tower water: a demonstration project. (R.J. Industries, New Canaan, CT (USA)). [1985]. Contract FG41-81R121267. 20p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85013406.

R.J. Industries, Inc. under the DOE Appropriate Technology Program, designed, installed, and monitored a side stream water filtration system on a typical cooling tower arrangement supplying condenser water to refrigerated chilled water units. All of the components utilized in the filter system were readily available. (The actual filter unit was designed to maintain the clarity and overall quality of swimming pool water). R.J. Industries modified the flow characteristics and adapted the hardware for use with a cooling tower system. The application of existing equipment in a new technology proved to be a practical, cost effective approach for maintaining the quality of cooling tower water.

31355 (DOE/R2/05151—T1) **Building heat conservation and the feasibility of solar hot water heating in Long Island shellfish hatcheries.** Berg, D.L. (Berg (David L.), Miller Place, NY (USA)). [1980]. Contract FG42-80R205151. 81p. NTIS MF A01; 2; GPO Dep. File Number DE85013418.

Temperature regulation is a vital component of any aquaculture system. Existing facilities can be retrofitted with extra insulation, waste heat recovery systems and in some cases, active solar water heating. Those aquaculture ventures that seek to raise organisms to market size under controlled conditions are currently hindered by high operating costs, including fuel. These outfits can also benefit from conservation and alternative energy technologies. In addition, the industry may be more willing to cultivate species normally restricted by climatic conditions if a less expensive source of heating were available. This report focuses on three of the bivalve shellfish aquaculture enterprises of Long Island, New York. In the 1978 to 1979 growing season, Long Island shellfish growers collectively burned over 50,000 gallons of heating oil to warm their hatchery waters and buildings. Since then, heating oil prices have doubled. Currently, some growers are limited by these fuel costs from beginning production earlier in the season. In this report, several heat conservation measures are discussed, and the feasibility of active solar hot water is examined.

31356 (DOE/R3/06108—T1) **Energy self-sufficiency in the printing industry. Draft final report.** (Industry Consulting, Midlothian, VA (USA)). 1980. Contract FG43-79R306108. 206p. NTIS, PC A10/MF A01; 1; GPO Dep. File Number DE85008467.

The Printing Industry ranks 15th out of the top 20 industries as regards energy consumption. It is now trying to incinerate its paper waste with heat recovery. Purpose of this study was to research and examine the feasibility and economics of the proposed energy recovery system, and to develop a preliminary design of such a system. A literature review was also conducted. Institutional considerations are reviewed. Potential impacts of the proposed energy recovery system include energy savings in oil/gas usage up to 0.2 to 0.36% of 1975 oil imports, volume reduction of solid wastes of 250:1, and avoidance of plant shutdowns. (DLC)

31357 (DOE/SF/10581—T1) **Small-scale regenerator. Final report.** (Thermo Energy Corp., Mountain View, CA (USA)). Jun 1981. Contract FG03-79SF10581. 72p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85013401.

Furnaces operating at 1900 F lose about 50% of the input energy in the exhaust gases. One method of saving energy is to recover the heat from the exhaust of the furnace and use that heat to preheat the combustion air to the burners of the furnace. A regenerator accomplishes this heat exchange by using the exhaust gas to heat a surface, moving that surface out of the exhaust gas stream into the incoming airstream and cooling the surface by the incoming airstream. Work was done on a design that used small stone media to transfer the heat from the furnace exhaust gas to the incoming burner air. A regenerator was designed to mate with a 1,500,000 Btu/h small industrial furnace, saving 44% of its fuel flow. A cold flow model was constructed to evaluate the flow of the stone media through the chambers of the regenerator. The hot regenerator was manufactured from high temperature stainless steel to withstand hot gas inlet temperatures up to 1900°F. In test, the regenerator demonstrated an effectiveness of 79% at 1150°F compared to its design value of 97% at 1850°F. Several modifications to the design of the hopper were evaluated to overcome this problem but none was successful.

31358 (DTH-LET-RE—84-3) **Effect calculation of a gas turbine with recirculating flue gas.** Frederiksen, P.; Qvale, B. (Danmarks Tekniske Hojskole, Lyngby. Lab. for Energiteknik). 1984. 51p. (In Danish). NTIS (US Sales Only), PC A04/MF A01. File Number DE85750809.

Calculations indicate that the effect of gas turbine power plants can be improved by utilization of flue gas heat for the purpose of the suction air heating. Heating of suction air can occur either by means of a heat exchanger or by direct mixing of flue gas and suction air. Combustion chamber tests prove that a gas turbine combustor can be operated with atmospheric oxygen concentration reduced to 15%.

31359 (EGG-M—13085) **Development requirements for advanced industrial heat pumps.** Chappell, R.N.; Priebe, S.J.; Bliem, C.J.; Mills, J.I. (USDOE Idaho Operations Office, Idaho Falls; Idaho National Engineering Lab., Idaho Falls (USA)). 1985. Contract AC07-76ID01570. 13p. (CONF-850515—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012331.

From 7. annual industrial energy technology conference; Houston, TX, USA (13 May 1985).

DOE is attempting to advance the use of heat pumps to save energy in industrial processes. The approach has emphasized developing better heat pump technology and transferring that technology to the private sector. DOE requires that heat pump technology selected for development be both applicable to industrial processes and economically advantageous. To be applicable to industrial processes, heat pumps must be capable of temperature lifts and temperature operating ranges which are compatible with industrial processes. These two requirements for applicability appear to have more impact than all others. To be economically feasible, new technologies for pumping heat must have the potential to provide process heat at lower cost than can be provided by either alternative heat sources such as boilers or state-of-the-art heat pumps.

31360 (IS-EMRRI—19, pp 37-42) **Recovery of sulfur and lime from waste gypsum.** Kreischer, B.E.; Wheelock, T.D. Dec 1983. NTIS, PC A07/MF A01. File Number DE85011356.

In Iowa State Mining and Mineral Resources Research Institute. Final report, July 1, 1982-September 30, 1983.

Currently in the Iowa State University Chemical Engineering Department, development of a process to desulfurize gypsum (calcium sulfate) is underway. The process consists of a dual zone fluidized bed providing opposite reacting environments, self-contained within a single fluidized bed reactor. The lower zone provides a reducing atmosphere by incompletely combusting a fuel, such as natural gas or coal, while the upper zone is an oxidizing atmosphere. The reducing atmosphere is transformed into an oxidizing one by the addition of secondary air at some point higher up in the reactor. The main advantage in this dual zone systems lies in the very nature of a fluidized bed. The path that any one particle will follow will result in that particle experiencing each particular zone many times. This repeated exposure of the particles to the different zones will help circumvent the undesired production of calcium sulfide. This is accomplished through the subsequent oxidation of the calcium sulfide produced in the reducing zone. One important aspect of the further development of the ISU gypsum desulfurization process centers on the scale-up question. Any accurate economic feasibility study must include a reasonable estimate of the size of the fluidized bed reactor and the solids lost through entrainment.

31361 (IS-EMRRI—19, pp 91-102) **Utilization of coal-derived fly ash in combination with mining wastes.** Bergeson, K.L.; Pitt, J.M. Dec 1983. NTIS, PC A07/MF A01. File Number DE85011356.

In Iowa State Mining and Mineral Resources Research Institute. Final report, July 1, 1982-September 30, 1983.

Results of compressive strength screening and set time determinations, with the selection of chemical additives chosen, appear promising, relative to paste mixes at a water fly ash ratio of 0.24. At least two additives in each category of fly ash have shown an increased strength by a factor of 2 or more over that of the untreated controls. Initial setting time of the Neal No. 2 ash can be extended using some additives, by a factor of 3 or more without the loss of 28 day strength. Initial set time of the Neal No. 4 ash can be retarded by some additives ranging from 70 to 145 minutes. Strength loss at 28 days, however, ranges from 22 to 78 percent. Preliminary reaction product evaluation of Neal No. 4 fly ash treated with 3.0 percent ammonium phosphate indicate the glassy phase being dissolved and additional cementitious reaction products being formed. This preliminary evidence indicates that the mechanism for formation of the cementitious reaction products postulated may be valid.

31362 (PB—85-158897/XAB) Guide to packaged dehumidifiers. Brundrett, G.W. (Electricity Council Research Centre, Capenhurst (UK)). Oct 1984. 177p. (ECRC/M—1871). NTIS, PC E10/MF E10.

Almost two hundred packaged dehumidifiers are available for a wide range of specialist applications. Such dehumidifiers are unique in not only removing moisture but can also return the latent heat to the air and give a coefficient of performance in the heat-pump sense of 2. The application areas include curing condensation in housing, recovering energy in swimming pools, and drying industrial products. This Memorandum includes a comprehensive collection of data sheets from information supplied by the manufacturer. The Memorandum is intended as a Guide to the large and complex range of dehumidifier equipment on the market.

31363 (PB—85-165777/XAB) Barium and radium in water-treatment-plant wastes. Report for September 1983-May 1984. Snoeyink, V.L.; Jongeward, C.K.; Myers, A.G.; Richter, S.K. (Illinois Univ., Urbana (USA)). Feb 1985. 63p. NTIS, PC A04/MF A01.

Water treatment plants at nine locations (10 plants) in Illinois and Iowa were studied to determine the characteristics and disposal practices for the sludge, brine, and backwash water containing radium (Ra) and/or barium (Ba). The treatment processes in these ten plants include iron (Fe) and manganese (Mn) removal (3 plants), lime softening (4 plants), and ion exchange (3 plants). Eight plants had radium and three plants had barium. The data are needed to determine whether special procedures are required to dispose of such wastes.

31364 (PB—85-172575/XAB) Preliminary assessment of costs and credits for hazardous waste co-firing in industrial boilers. Final report, 1 July 83-15 oct 83. McCormick, R.; Weitzman, L. (Acurex Corp., Mountain View, CA (USA). Energy and Environmental Div.). Feb 1985. 64p. NTIS, PC A04/MF A01.

This report provides preliminary information on the costs and credits associated with hazardous waste co-firing in industrial boilers. The main objective is to identify and evaluate the costs/credits inherent in current hazardous waste co-firing practices, plus the additional costs that may be incurred as a result of more-stringent emissions limitations. An overview of current hazardous-waste/industrial-boiler co-firing practices is provided. This overview addresses the types of waste now being burned in boilers, the generic designs and capacities of boilers now being co-fired, and the types of air pollution control device (APCD) retrofits that may be required in the advent of air-emissions regulations. Parametric cost-estimate methods are provided for: (1) waste-handling-equipment addition, (2) combustion-system retrofit, (3) APCD retrofit, (4) incremental OandM costs, and (5) fuel savings and waste-disposal credits. The cost-estimating approach is designed to account for differences in waste characteristics, boiler design, capacity, and waste/fuel co-firing ratio. Finally, cost/credit calculations are presented for two hypothetical waste co-firing scenarios. These calculations are presented to illustrate how the information provided in this report can be used; no conclusions concerning the economy of waste co-firing are intended.

31365 (PB—85-174910/XAB) Centralized ladle preheating system. Final report, March 1982-February 1984. Battles, B.E.; Battles, D.D. (Thermecon, Atlanta, GA (USA)). Jun 1984. 62p. NTIS, PC A04/MF A01.

See also PB85-101467.

Ladle preheating in metals production is an energy-intensive process and is usually done inefficiently. A successful ladle preheating system for large-scale applications (ladle of 50 to 500 tons capacity) has been developed. This system uses a heat exchanger and sealed heating thus minimizing losses. Because of equipment costs, identical systems cannot be economically scaled down for ladles under 50 tons. However it is possible to centralize some functions of a multiple heating station thus reducing capital costs. A single heat exchanger, combustion air blower, and control subsystem can be shared by several heaters. The scope of this project is to produce such a design. The development of this technology will allow foundries and small-scale steel mills to reduce their energy cost for ladle preheating. It may also convince operators to implement an energy saving gas fired system where no heating was previously being used.

31366 (PB—85-177111/XAB) Using mined space for long-term retention of nonradioactive hazardous waste. Volume 1. Conventional mines. Final report, August 1983-January 1985. Stone, R.B.; Moran, T.R.; Weyand, L.W.; Sparkman, C.U. (Fenix and Scisson, Inc., Tulsa, OK (USA)). Mar 1985. 108p. NTIS, PC A06/MF A01.

See also PB85-177129.

This two-volume report assesses the current status of using mined space for long-term retention of nonradioactive hazardous waste. Volume 1 updates previous studies conducted in 1974 and 1975 and examines published literature, determines involvement of government agencies, reviews regulatory and permitting requirements, and identifies existing mines for a potential demonstration project.

31367 (PB—85-177129/XAB) Using mined space for long-term retention of nonradioactive hazardous waste. Volume 2. Solution-mined salt caverns. Final report, August 1983-January 1985. Stone, R.B.; Covell, K.A.; Weyand, L.W. (Fenix and Scisson, Inc., Tulsa, OK (USA)). Mar 1985. 66p. NTIS, PC A04/MF A01.

See also PB85-177111.

This two-volume report assesses the current status of using mined-space for long-term retention of nonradioactive hazardous waste. Volume 2 expands the definition of mined space to include that created by solution mining of salt. This report examines the extent of salt deposits in the continental United States, relates the salt deposits to waste-generating regions, examines the variances in salt chemistry for the various deposits, describes the methods for creating solution-mined caverns, discusses design and operation considerations, discusses projects proposed by industry, discusses advantages of the concept, and discusses needed research.

31368 (PB—85-185890/XAB) Bench-scale process evaluation of reburning and sorbent injection for in-furnace NOx/SOx reduction. Final report, October 1983-October 1984. Greene, S.B.; Chen, S.L.; Clark, W.D.; Heap, M.P.; Pershing, D.W. (Energy and Environmental Research Corp., Irvine, CA (USA)). Mar 1985. 256p. NTIS, PC A12/MF A01.

The report gives results of combining reburning with the injection of calcium-based sorbents to investigate the potential for combined NOx and SOx reduction. Reburning, applied to pulverized-coal-fired utility boilers, involves injecting a secondary fuel above the main firing zone to produce a reducing zone where NOx is converted to molecular nitrogen. Overfire air is added above the reburn reducing zone to complete the combustion. Bench-scale evaluations of reburning, carried out in a plug-flow furnace at 23 kWt, have indicated that NOx reductions of up to 70% can be achieved depending on a number of process variables, dominant of which are the initial NOx level that is to be reduced, the reburning fuel type (pulverized coal type or natural gas), and the stoichiometry, residence time, and temperature in the reducing zone. Combining the two processes indicates that the optimum sorbent injection location in a reburning system is with the burnout air because of the increased reactivity of the calcined sorbent. Dolomite consistently produces higher capture than calcitic limestone for a wide spectrum of combustion conditions. It is possible to relate sulfur capture directly to sorbent reactivity as characterized by surface area after calcination. Sulfur capture in a coal-fired system is similar to that obtained with doped propane. Sulfur capture is most dependent on injection temperature.

31369 (PNL—5466) Survey of US Department of Defense Manufacturing Technology Program activities applicable to civilian manufacturing industries. Final report. Azimi, S.A.; Conrad, J.L.; Reed, J.E. (Energetics, Inc., Columbia, MD (USA)). Mar 1985. Contract AC06-76RL01830. 222p. NTIS, PC A10/MF A01; GPO Dep. File Number DE85012249.

Intent of the survey was to identify and characterize activities potentially applicable to improving energy efficiency and overall productivity in the civilian manufacturing industries. The civilian industries emphasized were the general manufacturing industries (including fabricated metals, glass, machinery, paper, plastic, textile, and transportation equipment manufacturing) and the primary metals industries (including primary aluminum, copper, steel, and zinc production). The principal steps in the survey were to: develop overview taxonomies of the general manufacturing and primary metals industries as well as specific industry taxonomies; identify needs and opportunities for improving process energy efficiency and productivity in the industries included; identify federal programs, capabilities, and special technical expertise that might be relevant to industry's needs and opportunities; contact federal laboratories/facilities, through visits and other forms of inquiry; prepare formatted profiles (descriptions) potentially applicable work efforts; review findings with industry; and compile and evaluate industry responses.

31370 **(PNL—5512) User manual for Conservation Project Data Base.** Garrett-Price, B.A.; Fassbender, L.L. (Pacific Northwest Labs., Richland, WA (USA)). Jun 1985. Contract AC06-76RL01830. 100p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85013806.

This User Manual describes the Conservation Project Data Base developed by the Pacific Northwest Laboratory for the Department of Energy's Office of Conservation (CE). Purpose of this data base is to provide a centralized storehouse of information on planned and ongoing projects funded by CE. The data base is a powerful analytical tool that will enable CE to quickly analyze the composition of their project portfolio. The data base uses dBase III on an IBM PC. Over 80 data items are stored for each project. A menu-driven applications program was developed as an alternative to using standard dBase III commands. The menu-driven program prompts the user to add data, edit data, perform on-screen searches of the data base, sort the data base by any variable or combination of variables, or print hard-copy reports of various data items.

31371 **(AD-A—150181/6/XAB) Reliability, availability, and maintainability of the heat-recovery incinerator at Naval Station Mayport. Final report, October 1981-March 1983.** Zimmerle, J. (Naval Civil Engineering Lab., Port Hueneme, CA (USA)). Oct 1984. 101p. (NCEL-TN—1708). NTIS, PC A06/MF A01.

The heat recovery incinerator (HRI) at Naval Station Mayport, Fla. was studied to determine the expected long-term performance of the HRI. The data, which were collected from October 1980 to August 1983, were analyzed for reliability, availability, maintainability, waste incineration rate, thermal efficiency, and steam cost. Actual results for incinerating waste to produce steam were: reliability 58% (75% of design); availability 82% (91% of goal); maintainability 0.10 man-hr/ton (100% of goal); thermal efficiency 48% (87% of goal); incineration rate 1.75 tons/hr (105% of goal); and cost of steam $6.05/MBtu. The HRI was expected to save $26,600/yr from landfill reductions and $102,320/yr from energy savings. The principal reasons for the shortfalls in performance were shortages of solid waste, and failures in the crane, feed rams, ash conveyor, front-end loader, feedwater equipment, and induced draft (I.D.) fan. Corrections have been made in HRI operation to improve performance of the ash conveyor. Recommendations are made on additional maintenance procedures, and on equipment design criteria to improve plant operation and for future plant design.

31372 **(AD-A—152236/6/XAB) Heat-recovery incineration: a summary of operational experience. Final report.** Ducey, R.A.; Joncich, D.M.; Griggs, K.L.; Sias, S.R. (Army Construction Engineering Research Lab., Champaign, IL (USA)). Mar 1985. 19p. (CERL-SR-E—85/06). NTIS, PC A02/MF A01.

This report summarizes the results of a study to determine how reliably heat-recovery incinerators (HRIs) are performing in the field. Information on equipment used, operating parameters, economic factors, and problems encountered in operating HRIs was provided by 52 installations throughout the United States. Twenty of the most common problems experienced with HRIs in the field are discussed. In each case, the percentage of installations experiencing each problem is also provided. Military personnel can use this information to evaluate HRIs for military applications. Overall, the majority of HRIs users were found to be generally satisfied with the performance of their systems. However, they indicated that efficiency could be improved and the amount of maintenance reduced. The most appropriate HRI must be chosen on a site-specific basis. It has been noted that the most successful applications have been at installations which thoroughly researched their waste supply and steam demands before project design, chose the HRI manufacturer carefully, and properly trained their operators.

31373 **(BFR-R—58-1983) Heat recovery from sewage effluent by heat pumps for supply to the Enkoeping district heating system. A feasibility study.** Svensson, T.; Wahlberg, H.; Wahlberg, O. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1983. 59p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. File Number DE85750854.

This feasibility study describes a general model for economic sizing of additional energy production units in a district heating plant. The model can be used even if other energy sources are already in use. All costs have been expressed as function of the thermal output power of the energy production plant for optimization purposes. Differentiation with respect to power indicates the economic optimum installation. This economic model has been used for calculating the optimum size of heat pump to be used by the Enkoeping District Heating Company for recovery of heat from purified sewage effluent. Calculations have allowed for both daily and annual variations in effluent flow. Existing production plant is based on oil, coal and wood chip fuels. In the light of favourable Swedish electricity tariffs, only electrically driven heat pumps have been considered. The results indicate that the economic optimum size of heat pump is about 5 MW, producing a calculated internal interest rate of 24 percent. A semi-empirical calculation procedure has been used to analyse changes in ice cover if the temperature of sewage effluent is reduced by the heat pump. The results indicate that there would be only marginal effects on the thickness of ice cover.

31374 **(DOE/SF/01948—T1) Covered, anaerobic, wastewater lagoon primary treatment system, the "anaerobic cell". Technical completion report.** Alsten, C.; Stewart, W. (Solar AquaSystems, Inc., Encinitas, CA (USA)). 10 Apr 1980. Contract FG03-78SF01948. 108p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE85013407.

Progress achieved during the period covered in the grant is presented. Supporting documents including progress reports are included. The purpose of this project has been to study the operational characteristics of a covered, anaerobic, primary lagoon developed by Solar AquaSystems called the "Anaerobic Aquacell" (ANA) as a domestic wastewater treatment system for the reduction of BOD, suspended solids, nutrients, heavy metals and toxic materials and the production of methane as an energy product. The process is an aquaculturally derived wastewater treatment system which integrates proven wastewater treatment elements to allow greater process control, higher quality effluent, and reduced land area as compared to conventional wastewater lagoons. Three AquaCell pond systems, anaerobic, facultative, and aerobic, all containing high surface area bio-film devices, can be used in series to achieve primary, secondary and/or advanced treatment, respectively. Three years of pilot scale demonstrations have shown that conservative design practices can be used while also achieving reduced construction, operation and maintenance costs, minimal solids handling, low energy demand, and low operator skill requirements. The use of a multiple series of controlled cells allows a high degree of design and operational flexibility for meeting various effluent quality objectives. The City of Hercules, California, Solar AquaCell Treatment System is also described.

31375 **(PB—85-156941/XAB) Theory, design, and operation of nutrient-removal activated-sludge processes.** (Johannesburg City Council (South Africa); Cape Town Univ. (South Africa); National Inst. for Water Research, Pretoria (South Africa)). 1984. 218p. NTIS, PC E10/MF E01.

Errata sheet inserted. Prepared in cooperation with Cape Town Univ. (South Africa), and National Inst. for Water Research, Pretoria (South Africa). Sponsored by Water Research Commission, Pretoria (South Africa).

Caution should be exercised when selecting an unbiodegradable particulate COD fraction (f(sub up): social organization of the community for whom the wastewater treatment process is envisaged must be critically examined. For example, analyses of data reported by Sutton et al. (1979) from Canada, indicate that the (f(sub up) fraction is 0,25 for raw wastewater. Such a high value probably arises from the use of garbage grinders. A similarly high (f(sub up) is used in the design procedure followed by Black and Veatch (1979) (based on McKinney's activated sludge model) which includes an unbiodegradable organic material fraction which is equivalent to an (f(sub up) value of 0,23. Wastewaters with high (f(sub up) fractionswill result in greater sludge production than those with low fractions and selecting too low a value will result in underdesign of the treatment process and sludge disposal facilities. This demonstrates the pitfalls in selecting wastewater characteristics uncritically and without recognition of the factors which contribute to their nature and composition. It also demonstrates the dangers of applying uncritically, technology developed overseas to local conditions and vice versa.

31376 **(PB—85-167245/XAB) Technology assessment of sequencing batch reactors.** Irvine, R.L. (Notre Dame Univ., IN (USA). Dept. of Civil Engineering). Feb 1985. 82p. NTIS, PC A05/MF A01.

The innovative and alternative technology provisions of the Clean Water Act of 1977 (PL 95-217) provide financial incentives to communities which use wastewater treatment alternatives that reduce costs of energy consumption over conventional systems. Some of these technologies have been only recently developed and are not in widespread use in this country. In an effort to increase awareness of the potential benefits of such alternatives and to encourage their implementation where applicable, the Municipal Environmental Research Laboratory has initiated this series of Emerging Technology Assessment reports. This document discusses the applicability and economic feasibility of utilizing sequencing batch reactors as a viable alternative to conventional continuous-flow activated-sludge facilities for the treatment of municipal wastewater.

31377 **(ORNL—6142) Factors that influence the implementation of energy-saving technologies at Naval shore facilities.** Brown, M.A.; Jones, D.W. (Oak Ridge National Lab., TN (USA)). Apr 1985. Contract AC05-84OR21400. 75p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85012059.

The purpose of this report is to assist the Naval Civil Engineering Laboratory by identifying important factors that influence the adoption and continued use of energy conserving technologies at Naval shore facilities. Results of site visits and a survey of decision makers at Naval shore facilities in the southeastern United States suggest that a significant barrier to adoption of new energy-conserving technology is the shortage of personnel to install, operate, and maintain new equipment. This situation enforces energy use patterns which may appear excessive, but which may be appropriate choices when guided by conditions of local manpower scarcities combined with the ability to draw on additional funds to cover unpaid fuel bills. A contributing problem is that only a small proportion of energy consumption activities are metered and many existing meters go unread. The inability to identify excessive energy users and to verify energy savings inhibits effective modifications of behavioral patterns and the introduction of new equpment.

31378 **(PB—85-158277/XAB) Neighborhood energy works.** (Technology and Economics, Inc., Cambridge, MA (USA)). 2 Mar 1982. 206p. NTIS, PC A10/MF A01.

This resource tool for neighborhood groups planning to start or expand an energy conservation program offers useful information on organizational techniques and practices as well as energy conservation and production technologies. The opening chapters on community project organizing, public relations, financing, and program marketing detail the procedures for starting and expanding a neighborhood organization. Each explains the techniques and resources available to organize, administer, publicize, finance, and sell the energy program. A chapter on energy technologies contains three major sections. The first section discusses appropriate technology that permits the designing of energy projects to match the skills and resources of a particular organization with the energy conservation and economic development needs of the targeted neighborhoods. The second section contains information on energy conservation measures applicable to residential and commerical buildings, while the last section outlines renewable resource technologies, both active and passive, which may be used effectively in the energy programs. The resource directory provided is a five-part listing of energy-related resources: (1) a reference guide listing publications, periodicals, and audiovisual materials; (2) national energy information sources; (3) national energy organizations; (4) government agencies; and (5) a listing of State energy extension services and State energy offices. The appendix contains detailed case studies of nine neighborhood organizations involved in energy conservation and production programs.

33 ADVANCED AUTOMOTIVE PROPULSION SYSTEMS

3301 Internal Combustion Engines

31379 (CONF-831142—, pp i-iv) **Welcome and program overview.** Chesnes, A.A. (Dept. of Energy, Washington, DC). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

An overview of the Department of Energy's Automotive Technology Development Program is presented. The program continues to follow the guidelines established by the National Energy Policy Plan of 1981 and focuses on proof-of-concept type development, long-term high-risk technology barriers, and more generic research with wide applications. The total budget for FY1983 for these activities was $39.5 million or about the same as for FY1982. The program efforts continue to show excellent progress with all major projects essentially on schedule, are meeting or surpassing goals and objectives, and remain within established budgets.

31380 (CONF-831142—, pp v-vii) **Keynote address (Automotive Technology Development Program).** Collins, W.P. (Dept. of Energy, Washington, DC). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

Industry successes as well as the accomplishments of the US DOE in the Automotive Technology Development Program are discussed. The US DOE believes in conservation as a part of a comprehensive and balanced energy policy because the transportation sector currently uses nearly 27% of the total energy consumed in the US and transportation claims 61% of all petroleum consumed in this country. Achievements in the field of transportation energy efficiency can significantly contribute to the future security and prosperity of the US.

31381 (CONF-831142—, pp 99-100) **Heavy duty transport technology project overview.** Davidson, H.W. (NASA Lewis Research Center, Cleveland, OH). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

The DOE/NASA Heavy Duty Transport Technology Program initiated in 1981 is managed by NASA Lewis Research Center. The program has a primary objective to provide a technology base for industry to use in developing advanced heavy duty transport engines. The project focuses on adiabatic diesel engines for long-haul trucks because of their potential for fuel savings when used in this sector of the transportation industry. The term adiabatic diesel engine refers to any class of diesel engines which incorporate insulated walls of the chambers enclosing the working fluid in an attempt to improve engine efficiency. Industry ideas and participation in this project are encouraged through the use of Applications Notices (AN's). To date about ninety unsolicited proposals have been received in response to the two AN's issued in February 1982. About twenty contracts or grants were awarded in the five key technology areas. These areas are component technology, materials, waste heat utilization, tribology, and systems. Each of these areas is briefly discussed.

31382 (CONF-831142—, pp 101-106) **Development of future performance maintenance and cost requirements for heavy duty diesel engines.** Strawhorn, L.W.; Suski, V.A. (American Trucking Associations, Washington, DC). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

Developers of advanced heavy duty diesel engines are engaged in probing the opportunities presented by new materials and techniques. This process is technology driven. But there is neither assurance that the eventual users of the engines produced by this process will be comfortable with them nor indeed that the users will be around in either the same form, or the same numbers they are today. The equipment development process must have more user input to ensure maximum payoff of research dollars. An approach to generating this input, defining user concerns, cost tolerances, and defining engine parameters that would match future projected industry needs was developed. The approach is explained and results gathered to date are presented.

31383 (CONF-831142—, pp 107-120) **Investigation of enhanced thermal barrier coating systems for diesel engine components.** Schechter, B. (GM Corp., Indianapolis, IN). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

Results to date of investigations of thermal barrier coating systems for diesel engine components are presented. These coating systems employ a plasma sprayed layer of partially stabilized zirconia on a metal substrate. In some cases, a strain isolator is used as an intermediate layer between the coating and the substrate. Several measured system thermal conductivity values are presented as well as a discussion of additional tests to follow in completing the investigation.

31384 (CONF-831142—, pp 121-134) **Cummins/TACOM advanced adiabatic engine.** Kamo, R.; Bryzik, W. (Cummins Engine Company, Inc., Columbus, IN). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

Cummins Engine Company, Inc., and the US Army have been jointly developing an adiabatic turbocompound engine during the last nine years. Although progress in the early years was slow, recent developments in the field of advanced ceramics have made it possible to make steady progress. It is now possible to reconsider the temperature limitation imposed on current heat engines and its subsequent influence on higher engine efficiency when using an exhaust energy utilization system. An adiabatic turbocompound diesel engine concept is presented in which high performance ceramics are used in its design. The adiabatic turbocompound engine will enable higher operating temperatures, reduced heat loss, and higher exhaust energy recovery, resulting in higher thermal engine efficiency. The careful selection of ceramics in engine design is essential. Adiabatic engine material requirements are defined and the possible ceramic materials which will satisfy these requirements are identified. Examples in design considerations of engine components are illustrated. In addition to these important points, the use of ceramic coatings is described in the design of engine components. The first generation adiabatic engine with ceramic coatings is described. The advanced adiabatic engine with minimum friction features utilizing ceramics is also presented. The advanced ceramic turbocharger turbine rotor as well as the oilless ceramic bearing design is described. Finally, the current status of the advanced adiabatic engine program culminating in the AA750 V-8 adiabatic engine is presented.

31385 (CONF-831142—, pp 135-140) **Advanced automotive diesel assessment program.** Sekar, R.; Kamo, R. (Cummins Engine Company, Inc., Columbus, IN). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

The results of the feasibility study completed by Cummins Engine Company to identify an advanced automotive diesel (AAD) engine for passenger car applications are outlined. The study resulted in the definition of an adiabatic diesel engine with several novel features. The predicted fuel economy of a 3000-pound AAD powered car is 78.8 MPG on a combined metro-highway route. This compares with a current production diesel powered car yielding 37.7 MPG. All other critical features of the AAD, such as emissions, noise, driveability, cost, durability, etc. are comparable to current products on the market. The problem areas such as NOx emissions, initial cost, etc. appear to be amenable to solution. Four long lead time technology areas needing experimental verification are discussed.

31386 (CONF-831142—, pp 141-148) **Exhaust-driven Brayton Bottoming Systems for adiabatic diesel engines.** Khalifa, H.E. (United Technologies Research Center, East Hartford, CT). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

An evaluation of Brayton Bottoming Systems (BBS) as waste heat recovery devices for future adiabatic diesel engines in heavy duty trucks is presented. Parametric studies were performed to evaluate the influence of external and internal design parameters on BBS performance. Conceptual design and trade-off studies were undertaken to estimate the optimum configuration, size and cost of major hardware components. The potential annual fuel savings of long-haul trucks equipped with BBS were estimated. It is shown that the BBS could effect about 12% of annual fuel savings and would cost about $170/Bhp. It is also shown that, when properly integrated with a turbocharged adiabatic engine, the BBS would offer a 3.3 years simple payback relative to the aftercooled, turbocompound version of the same engine.

31387 (CONF-831142—, pp 149-154) **Steam bottoming cycle study for heavy duty transport.** Demler, R.L.; Hug, H.A.; Krepchin, I.P.; Poulin, E.C.; Walker, D.H. Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

A DOE/NASA sponsored study of steam bottoming cycles using diesel engine exhaust heat projected substantial performance and economic benefits for long haul trucks. A state-of-the-art reciprocating expander steam system was ultimately selected for conceptual design and economic assessment. This 1000 psia 1000°F simple cycle represents the combined operational experience of perhaps 10,000 steam engine hours at these conditions accumulated by several R and D firms in this field.

31388 (CONF-831142—, pp 155-168) **Status report for an RC-1 organic Rankine bottoming cycle for an adiabatic diesel engine.** Koplow, M.D.; DiNanno, L.R.; DiBella, F.A. (Thermo Electron Corp., Waltham, MA). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

A system analysis and preliminary design was conducted for an organic Rankine-cycle system to bottom the high-temperature waste heat of an adiabatic diesel engine. The bottoming cycle is a compact package that includes a cylindrical air-cooled condenser-regenerator module and other unique features. The bottoming cycle output is 56 horsepower at design point conditions when compounding the reference 317 horsepower turbo-charged (TC) diesel engine with a resulting brake specific fuel consumption (BSFC) of 0.268 lb/hp-hr for the compound engine. This system for Heavy Duty Transport applications uses the organic working fluid RC-1, which is a mixture of 60 mol % pentafluorobenzene (PFB) and 40 mol % hexafluorobenzene (HFB). Included in these 1983 work efforts was the thermal stability testing of the RC-1 organic fluid in a dynamic fluid test loop that simulates the operation of a Rankine cycle. To date, more than 1300 hours of operation have been completed with results showing that the RC-1 is thermally stable at 900°F.

31389 (CONF-831142—, pp 183-192) **Time-temperature dependence of the strength of commercial zirconia ceramics.** Schioler, L.J.; Quinn, G.D.; Katz, R.N. (Army Materials and Mechanics Research Center, Watertown, MA). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072. Contract AI01-77CS51017.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

The unusual combination of attractive properties exhibited by transformation toughened zirconias (TTZ's) has focused attention on them as leading candidates for application in the adiabatic diesel engine. These materials are age-hardened ceramic alloy systems and as such they are likely to be susceptible to overaging and loss of strength at long times at high temperatures. Preliminary data are presented on the microstructural, phase and dimensional stability of aged TTZ's together with some data on the effects of aging on strength, toughness and modulus. Stress rupture data on TTZ's with both MgO and Y_2O_3 additions show a considerable decrease in load carrying ability at temperatures of 800°C and above.

31390 (CONF-831142—, pp 193-200) **Long-term stability and properties of commercial zirconia ceramics.** Larsen, D.C.; Adams, J.W. (IIT Research Institute, Chicago, IL). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

The physical, mechanical, and thermal properties of transformation-toughened zirconia ceramics can vary widely, depending on initial particle size, concentration of alloying oxide used, processing time-temperature schedule, and post-fabrication heat treatment and surface preparation. The goal of this program is to determine the properties and long-term stability of such materials that are currently being developed by the ceramics industry. Previously, five foreign and domestic commercially available zirconia ceramics were characterized. Investigated were crystal phases, stabilization, microstructure, thermal expansion, strength, elastic modulus, and fracture mode with respect to transformation-toughening, phase stability, and overaging phenomena. Future work will address material behavior before and after long-term exposure in static oxidizing atmosphere. The central issue in this program is the stability of the tetragonal zirconia crystal phase; i.e., the phenomenon of overaging upon extended thermal exposure, and resultant loss of toughness.

31391 (CONF-831142—, pp 207-214) **Transformation toughening in the Al_2O_3-Cr_2O_3/ZrO_2-HfO_2 system.** Brog, T.K.; Jones, J.W.; Tien, T.Y. (Univ. of Michigan, Ann Arbor). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

Strength and fracture toughness have been studied at room temperature for the (Al_2O_3 - XCr_2O_3) + 15 v/O (ZrO_2 + $YHfO_2$) systems for Cr_2O_3 contents ranging from 0-30 mole % in Al_2O_3 and HfO_2 contents ranging from 0-30 mole % in ZrO_2. Preliminary results indicate that bend strength is more strongly influenced by processing defects than composition. It was found that fracture toughness increased with increasing Cr_2O_3 and HfO_2 additions. Further work is required to elucidate the mechanisms of toughening and the effect of composition and particle size.

31392 (CONF-831142—, pp 215-222) **Transformation toughening of ceramics for engines.** Musikant, S.; Rauch, H.W. Sr.; Feingold, E. (General Electric Co., Cincinnati, OH). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

A progress report on a development program aimed at the enhancement of elevated temperature mechanical properties of ceramic matrixes strengthened by the transformation toughening (TT) technique is presented. Both alumina and mullite have been formulated containing a solid solution of ZrO_2 and HfO_2 ($Zr_{0\ 5}\ Hf_{0\ 5}\ O_2$). The addition of the HfO_2 is designed to preserve the TT effect at temperatures up to 2500F. Processes for formulating such materials have been identified, and measurements of K/sub IC/, modulus of rupture and compression strength are being conducted. The study is anticipated to lead to scale-up and design and fabrication of an appropriate diesel engine ceramic component for engine test.

31393 (CONF-831142—, pp 333-336) **Industry Perspectives Session.** Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

A special session was convened to obtain constructive feedback from the conference attendees aimed at improving program content and gauging industry and program content and gauging industry and program participant opinion on a selection of relevant policy issues. The Industry Perspectives Session focused on specific issues dealing with current program content and future program direction, industry coordination, and technology transfer. To facilitate obtaining quantitative feedback from the audience, Dr. David E. Cole, Professor of Mechanical Engineering, University of Michigan, framed a series of questions on each of the issues for which he also provided the necessary background information. One hundred and seventy-six (176) conference attendees participated in this session.

31394 (CONF-831142—, pp 405) **Results of the Coordinating Research Council methanol-gasoline blends program.** Gallopoulos, N.E. (General Motors Research Labs., Warren, MI). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

The Coordinating Research Council, Inc. (CRC) conducted a test program designed to define the emissions, fuel economy, driveability, and vapor lock characteristics of volatility-adjusted methanol-gasoline blends versus gasoline. The fuels were tested in 1980 model year cars representing various emission control technologies using test procedures accepted by the Federal Government and industry. Six unleaded fuels were used for this phase of the program: a reference gasoline and five methanol blends. The methanol-gasoline blends had oxygen contents ranging between 1 and 8%, and included fuels with and without isobutanol co-solvent. Ten 1980 model cars were used. The study showed that methanol in gasoline affected most vehicle performance parameters. Organic and carbon monoxide tailpipe emissions were reduced, but effects on other emissions, driveability, and fuel economy were generally adverse with methanol at the higher concentrations. Another experimental program is needed to define the response of vehicle performance factors to fuel characteristics such as oxygen content and volatility, which this program strongly suggests are the two most influential on vehicle performance.

31395 (CONF-831142—, pp 369-376) **Investigation of the potential for improving efficiency of a spark ignition engine operating on natural gas - Phase I status report.** O'Neal, G.B. (Southwest Research Institute, San Antonio, TX). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

The ebbing tide of cheap fossil-based liquid hydrocarbon fuels has stimulated interest in alternate fuels for spark-ignition engines. Since natural gas (methane) is readily available and enjoys a favorable cost advantage through lower taxes and price regulation, the popularity of engine conversion to natural gas has increased significantly in recent years. However, fuel cost rather than energy efficiency has been the primary motivation behind these engine conversions, and little emphasis has been placed on the antiknock, wide flammability, and emissions characteristics of methane. The most efficient utilization of methane as a motor fuel can be achieved only in an engine optimized for this fuel. Since there are so many different types and applications of spark-ignition engines, this project was aimed at a specific engine application - the light duty vehicle used in fleet operation. The objective of this project was then to evaluate in the laboratory performance, economy, and emissions improvements obtainable from a spark-ignition engine representative of those used in fleet operation of light duty vehicles.

31396 (CONF-831142—, pp 377-382) **Advanced on-board storage concepts for compressed natural gas fueled automotive vehicles.** Remick, R.J.; Camara, E.H. (Institute of Gas Technology, Chicago, IL). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

A parametric study of methane adsorption on high surface area carbons and high pore volume zeolites was undertaken to identify those properties which exercise the greatest influence on the storage capacity of an adsorption system. Results indicate that adsorbent systems utilizing activated carbon are better than systems utilizing zeolites both on a gas delivered per unit volume and a gas delivered per unit weight basis. The best results were obtained with high surface area carbons with high packing density. This work tentatively suggests that storage capacities equal to those obtained by compression systems operating at 137 atm (13.9 MPa) can be achieved by adsorption systems operating at pressures below 35 atm (3.6 MPa). The best results observed to date have achieved 70% of this goal.

31397 (CONF-831142—, pp 231-240) **Room and elevated temperature sliding contact-stress behavior of transformation-toughened zirconium oxide ceramics.** Lindberg, L.J. (Garrett Turbine Engine Co., Phoenix, AZ). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

Monolithic SiC and Si_3N_4 are susceptible to contact-stress damage at static and sliding interfaces. A program was initiated in 1983 to evaluate transformation-toughened zirconium oxide (TTZ) under similar contact conditions to determine if a higher material fracture toughness would reduce the susceptibility to contact-stress damage. Contact-stress tests have been conducted on Nilsen TS-grade magnesia stabilized and NGK Z-191 ytrria stabilized TTZ at normal loads ranging from 1 to 50 pounds at temperatures of room temperature, 1000, 1400, 1600, 1800, 2000 and 2200°F. Static and dynamic friction were measured as a function of temperature. Flexural strength measurements after these tests determined that the contact-stress exposure did not reduce the strength of the TTZ materials. Prior tests with the lower toughness SiC and Si_3N_4 materials resulted in substantial strength reduction at loads of only 10 to 25 pounds. An increase in material toughness appears to improve ceramic material resistance to contact-stress damage. Additional tests are in progress to evaluate the stress-rupture capability of the TTZ materials. Initial stepped-stress rupture tests have determined that the TTZ materials are susceptible to deformation due to creep and that the onset of creep occurs at different temperatures and stresses for the various TTZ materials.

31398 (CONF-831142—, pp 241-252) **Solid lubrication design methodology.** Aggarwal, B.B. (SKF Industries, Inc., King of Prussia, PA). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

A single element traction rig is used to measure the traction forces at the contact of a ball against a flat disc at room temperature under combined rolling and sliding speeds. The contact is lubricated by burnishing the lubricant on the disc surface before it enters the contact. Preliminary results using 440C balls and M50 discs show that the traction force is more sensitive to load than to rolling velocity. Traction force vs. time curves have accentuated the importance of adequate lubricant replenishment for maintaining a stable traction force and preventing surface damage.

31399 (CONF-831142—, pp 339-348) **Effects of fuel molecular structure on diesel exhaust particulates.** Ng, H.K.; Borman, G.L. (Univ. of Wisconsin, Madison). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

Six different fuels were tested using a modified TACOM-LABECO single cylinder diesel with a four hole nozzle and 24:1 compression. The engine condition was fixed at 22° btdc injection timing, 0.5 equivalence ratio, 1000 rpm, naturally aspirated and medium swirl. Data taken included exhaust particulate mass and cylinder pressure-time. The six fuels tested were commercial diesel fuel No. 1 and 2 blended to give a cetane number 43.3, JP-7 fuel with a cetane of 57.2 and only 2% aromatic content, two blends of one-ring aromatic solvent and JP-7 giving cetanes of 31.3 and 41.7 and two blends of two-ring aromatic solvent and JP-7 giving cetane numbers of 30.3 and 41.2 respectively. The two-ring aromatic blends gave 25-30% more particulates than the corresponding cetane one-ring blends. Both the one and two-ring blends showed that as aromatic content is increased beyond a certain point the resulting decrease in cetane number can cause a decrease in particulates despite the increase in aromatic content.

31400 (CONF-831142—, pp 349-360) **Flame propagation in heterogeneous mixtures of fuel drops and air.** Myers, G.D.; Lefebvre, A.H. (Garrett Turbine Engine Co., Phoenix, AZ). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

Photographic methods are used to measure flame speeds in flowing mixtures of fuel drops and air at atmospheric pressure. The fuels employed include a conventional fuel oil plus various blends of JP 7 with stocks containing single-ring and two-ring aromatics.The results for stoichiometric mixtures show that flame propagation cannot occur in mixtures containing mean drop sizes larger than 300 to 400 microns, depending on the fuel type. For smaller drop sizes, down to around 60 microns, flame speed is inversely proportional to drop size, indicating that evaporation rates are limiting to flame speed. Below around 60 microns, the curves of flame speed versus mean drop size, flatten out, thereby demonstrating that for finely atomized sprays flame speeds are much less dependent on evaporation rates, and are governed primarily by mixing and/or chemical reaction rates. The fuels exhibiting the highest flame speeds are those containing two-ring aromatics. This is attributed to the higher radiative heat flux emanating from their soot-bearing flames which enhances the rate of evaporation of the fuel drops approaching the flame front.

31401 (CONF-831142—, pp 361-368) **Utilization of shale and coal derived fuels in diesel engines.** Trevitz, S.S.; Lestz, S.S. (Pennsylvania State Univ., University Park). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

Four alternative fuels synthesized from shale and coal were tested for use in diesel engines. A single-cylinder DI diesel engine was used to compare these fuels with respect to a certified baseline DF-2 on the basis of combustion characteristics, performance, gaseous emissions, and particulate emissions. In addition, the biological activity of the particulate emission soluble organic fraction was assessed using TA-98$^-$ in the Ames Salmonella typhimurium test. The shale fuels studied included a Paraho marine diesel fuel and a light shale oil condensate from the Logan Wash in situ retorting operation. The coal liquids, Solvent Refined Coal-II and Exxon Donor Solvent, could not be run neat; therefore, they were blended 20% and 40% by volume with the baseline DF-2. The blended coal liquids and the light shale oil induced long ignition delays whereas the Paraho marine diesel fuel exhibited good finished fuel characteristics.

31402 (CONF-831142—, pp 383-388) **Future diesel fuel quality and its effects on existing engine performance; alternatives to diesel - the Canadian situation.** James, B.A. (Energy, Mines and Resources, Ottawa, Ontario). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

The quality of crude oil feedstocks available in Canada is expected to change considerably in the next decade. Feedstock will include more synthetic tar derived crudes, which are higher crudes. A reference diesel fuel for the 1990s has been developed and used in several medium and high speed engines. No major operational difficulties were experienced. In addition to crude supply and quality problems the gasoline to distillate ratio in refineries is being reduced due to conversion, substitution and dieselization of small trucks and cars. Development of alternatives to diesel are being developed. Canada's programs for using propane, natural gas, methanol, ethanol and canola oil are discussed.

31403 (CONF-831142—, pp 391-398) **Neat methanol as a fuel for compression ignition engines in transit bus operation.** Bennethum, J.E. (Detroit Diesel Allison, MI). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

Methanol has emerged as the most likely alternate to petroleum fuels. The primary reasons are abundant feedstocks, simple production technology, and potential cost competitiveness. Detroit Diesel has demonstrated that the two-stroke compression ignition engine is capable of auto-igniting pure methanol when the engine is at normal operating temperatures. This methanol engine has performance and brake thermal efficiency levels similar to a comparable diesel. Emissions of NOx and particulates, however, are substantially lower. Using methanol in transit buses presents the opportunity to reduce the significant bus contribution to the total suspended particulates in the major urban areas of the US. Although numerous questions remain to be answered before a US methanol economy becomes a reality, Detroit Diesel is doing the research and development required now to insure that methanol engines are available when needed.

31404 (CONF-831142—, pp 255-262) **Ceramic Applications in Turbine Engines (CATE) program summary.** Thrasher, S.R. (General Motors Corp., Indianapolis, IN). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

The objective of the Ceramic Applications in Turbine Engines (CATE) program was to utilize ceramic components in a highway vehicle gas turbine engine, thereby reducing fuel consumption by improving engine cycle efficiency due to operation at higher temperatures. The Allison CATE 404-4 was the test engine for this program. An evolutionary approach was employed, beginning with the introduction of ceramic components at 1900°F turbine inlet temperature. As test results from the 1900°F-configuration ceramic components became available, the 2070°-configuration components were designed. Both the 1900°F and 2070°F ceramic components were rig and engine demonstrated to maximum operating conditions. The CATE program has provided a sound technology base for ceramic components in gas turbine engines. This technology is being used in several areas at Allison, including development programs for the AGT 100, the low heat rejection diesel, the industrial Model 501-K engine, and the Teledyne Excentrix cruise missile engine.

31405 (CONF-831142—, pp 263-272) **AGT 100 Advanced Gas Turbine Technology Project.** Groseclose, L.E.; Helms, H.E.; Johnson, R.A. (General Motors Corp., Indianapolis, IN). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

The AGT 100 Advanced Gas Turbine Technology Project continued its proof-of-principle examination of an alternative engine for passenger car propulsion. Evaluation of small, high-efficiency components included combustor and regenerator rig testing, and a new thermal shock rig is being brought aboard for testing static ceramic turbine components. Ceramic component development has focused on injection-molded turbine rotors and slip-cast turbine scroll assemblies. Also emphasized was the development of methods for detecting flaws in ceramic components. Several acoustic techniques are being pursued. Two experimental engines have been fabricated and tested for a total of 41 hours, evenly divided between the two. The second engine achieved its 20 hours on one build of the turbomachinery. Several ceramic components have been engine tested at typical heat-up rates. All engine testing has been accomplished using ceramic combustor, regenerator disk and bulkheat, and various insulators and spacers.

31406 (CONF-831142—, pp 273-286) **AGT101 advanced gas turbine development program.** Kreiner, D.M.; Kidwell, J.R. (Garrett Turbine Engine Co., Phoenix, AZ). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

The Garrett/Ford Advanced Gas Turbine (AGT) Technology Project, authorized under NASA Contract DEN3-167, is sponsored by and is part of the US Department of Energy Gas Turbine Highway Vehicle System Program. Program effort is oriented at providing the US automotive industry the high-risk long-range technology necessary to produce gas turbine powertrains for automobiles that will have reduced fuel consumption and reduced environmental impact. The AGT101 powersection is a 100 hp, regenerated single-shaft gas turbine engine operating at a maximum turbine inlet temperature of 2500°F. Maximum rotor speed is 100,000 rpm. All high temperature components, including the turbine rotor, are ceramic. Development has progressed through aerothermodynamic testing of all components with compressor and turbine performance goals achieved. Some 170 hours of AGT101 (1600°F) testing has been accumulated on three metal engines. Individual and collective ceramic component screening tests to 2100°F have been successfully accomplished. In addition, ceramic turbine rotors have been successfully cold spun to the required 115,000 rpm proof speed (15% overspeed) and subjected to dynamic thermal shock tests simulating engine conditions. Assembly of the engine with ceramic structures is underway. Engine testing of the ceramic structures and the ceramic turbine rotor is planned in the near future.

31407 (CONF-831142—, pp 291-296) **Fabrication of silicon nitride turbine engine components.** Carruthers, D.W.; Liu, F.S.; Solidum, E.I. (Garrett Turbine Engine Co., Phoenix, AZ). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

The AiResearch Casting Company (ACC) is fabricating silicon nitride components for use in the Garrett/Ford AGT101 engine development program. Fabrication approaches were selected based on their suitability in an iterative development approach, on component size and on material property requirements. Reaction bonded Si_3N_4 static components are being fabricated to near net shape by slip casting or injection molding methods. Fabrication parameters for components of varying cross section, complexity, and size have been developed. Sets of static hardware including stators, turbine shrouds and inner and outer diffusers have been successfully screened individually and as an assembly in cyclic simulated engine conditions to 2100°F. Sintered Si_3N_4 radial rotors are being developed using a slip casting approach. Fabrication of this thick-hub/thin-blade art has required careful mold preparation and drying cycle development. Sintered development is being performed at both Ford and ACC. Rotors have been successfully tested in room temperature spin testing to 115,000 rpm and by cyclic thermal transient simulation.

31408 (CONF-831142—, pp 297-306) **Development of alpha silicon carbide components for gas turbine applications.** Tompkins, F.C. Jr. (Carborundum Co., Niagara Falls, NY). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

The progress and current status of the development of α silicon carbide components for both the AGT 100 and AGT 101 Advanced Gas Turbine Programs are described. The general approach taken to the successful fabrication of ceramic parts is presented. For each component, the following considerations are given: fabrication approach; problems encountered; solutions implemented to resolve problem areas; and progress demonstrated.

31409 (CONF-831142—, pp 307-314) **Characterization of sintered reaction bonded silicon nitride.** Mangels, J.A.; Baer, J.R.; Govila, R.K. (Ford Motor Co., Dearborn, MI). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

The properties of a series of slip cast sintered reaction bonded silicon nitrides are reviewed including the current grade, RM-3. This material has a room temperature strength of 100 Ksi and a Weibull modulus of 19 and exhibits good stress rupture behavior at moderate stress levels. It can survive testing at stress levels up to 40 Ksi and temperatures between 800 and 1000°C for times up to 500 hours without failure. The material characterization techniques used to evaluate these materials are also reviewed and discussed. The interaction between material development and material evaluation is stressed as is the need to continually develop testing procedures which can properly evaluate these materials.

31410 (CONF-831142—, pp 315-322) **Injection molded silicon nitride for engine applications: fabrication and properties.** Bandyopadhyay, G.; French, K.W.; Quackenbush, C.L. (GTE Laboratories Inc., Waltham, MA). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

Development of injection molded and sintered silicon nitride ceramics is continuing at GTE Laboratories for application in engine components. Both small (CATE axial turbine blades) and large (AGT 100 rotor) cross-section parts have been fabricated with good maintenance of geometry. CATE blades failed at an average of 136% of design speed in cold spin tests. They also exhibit good oxidation resistance. Fabrication of AGT rotors by sintering is currently limited by burnout cracking. Progress has been made in controlling these cracks. Preliminary experiments show that hot isostatic pressing can eliminate macroscopic internal flaws from AGT rotors.

31411 (CONF-831142—, pp 323-330) **Ceramic life prediction methodology.** Swank, L.R.; Baker, R.R.; Lenoe, E.M. (Ford Motor Co., Dearborn, MI). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

The objective of this program is to generate a time to failure data base on a gas turbine component and to compare the experimentally determined reliability versus time to calculated reliability versus time. To meet this objective a rotating disc was designed to fail due to time dependent mechanisms. Several discs were fabricated and an existing test rig was developed to test the discs at design conditions. Ten discs were tested at steady state under the design conditions of 2300°F rim temperature and 50,000 rpm for periods of 0.20 hours to 25 hours. An experimental failure distribution was obtained for the ten discs and presented as reliability versus time. Three different data bases were used to calculate reliability versus time and the results were compared to the experimental results.

31412 **(DOE/AL/16338—T1) Modeling of engine sprays.** Bracco, F.V. (Princeton Univ., NJ (USA). Dept. of Mechanical and Aerospace Engineering). 1985. Contract AC04-81AL16338. 24p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85010020.

Atomization and full-cone sprays from single cylindrical orifices are considered. The following subjects are reviewed: the structure of the breakup region; the structure of the far field; modern models that, given the outcome of the breakup process, compute the steady and transient of sprays; some comparisons with detailed measurements; and some practical applications. The following conclusions are reached: the spray breakup and the development regions are the most relevant in engine applications; the inner structure of the breakup region is still largely unknown; two- and three-dimensional spray models are available but remain mostly untested, particularly in their vaporization and combustion components, in part because of a lack of accurate measurements in controlled engine-type environments; engine applications of such models are, nonetheless, recommended for very valuable learning, interpretative, and exploratory studies, but not for predictions.

31413 (CONF-831142—, pp 1-14) **Automotive Stirling Engine Development Program: overview and status report.** Nightingale, N.P. (Mechanical Technology Inc., Latham, NY). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

The Automotive Stirling Engine (ASE) Development Program has been funded by DOE/NASA-Lewis Research Center since March 1978. To date, four first-generation automotive Stirling engines (called Mod I) have accumulated more than 3667 test hours. Two additional engines will be assembled and delivered to General Motors and John Deere for test and evaluation in 1984. The Reference Engine System Design (RESD), the engine design that most closely meets the overall program objectives, was modified in 1983 to reduce manufacturing cost while maintaining engine/vehicle performance. The revised RESD is projected to achieve an increase in specific power and a reduction in specific volume and manufacturing cost. Predictions indicate that fuel economy 48.5% above that of a comparable internal-combustion engine/vehicle installation has been attained. Two Mod I engines have been retrofitted with upgraded hardware to demonstrate design concepts embodied in the RESD. These upgraded engines have accumulated more than 325 test hours.

31414 (CONF-831142—, pp 15-26) **Automotive Stirling engine component development advances.** Ernst, W.D. (Mechanical Technology Inc., Latham, NY). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

Component development is a vital aspect of the Automotive Stirling Engine (ASE) Development Program. The objective of this activity is to advance Stirling engine technology with an emphasis on cost, performance, and design simplicity. Significant achievements have been made in each engine system area. These include, but are not limited to, elimination of strategic materials in the heater head; reduction of drive friction and elimination of low rpm power limit through use of rolling element drive; and a 75% reduction in combustion air system parts. Such advances have led to both performance improvements and simplification of the various engine systems; these advances allow the program effort to enter a new development phase. The challenge now lies in integrating the various system components into a complete engine and then proving this design by extensive test cell and transient testing.

31415 (CONF-831142—, pp 27-40) **Mod I Stirling engine performance data and analysis.** Richey, A.E. (Mechanical Technology Inc., Latham, NY). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

Engine testing conducted under the ASE program in the past year included further Mod I development and initial tests on the Upgraded Mod I engine. Data are also now available on the first Mod I engine built in the US, the Mod I engine No. 10. Transient test bed (TTB) testing of engine No. 1 produced additional development information, and a 1000-hour simulated, constant volume sampling (CVS) endurance test was conducted on engine No. 3. The first Upgraded Mod I engines have been development tested. Performance levels of the initial Upgraded Mod I were disappointing; however, an intensive test program identified the major problem areas, and corrective action has been taken to improve performance levels. An update of engine experience in the Mod I arena and the results of the Upgraded Mod I test program that commenced on schedule in April 1983 are presented. Early steady-state and transient testing of the Mod I engine were reported in previous Automotive Technology Development Contractors' Coordination Meetings.

31416 (CONF-831142—, pp 41-46) **Statistical life-testing of Stirling engine main seals (84ASE359TR29).** Lundholm, G. (United Stirling AB, Malmoe, Sweden). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

A series of endurance tests with two P40 Stirling engines is described. The tests were run according to specified duty cycles. The purpose was to gain an improved understanding on the variation in main seal oil leakage between different seal individuals manufactured to the same drawing and run to the same duty cycle, and also to investigate how different parameters influence main seal oil leakage rate. Running time was in most cases 500 hours. Graphs are presented, which show extent of oil leakage at end of each run. It is found that the crosshead diametral clearance is of importance for the following crosshead clearances of cylinder No. 1-4: Normal, 64% over max, 104% over max, and 140% over max. This test showed clearly that the oil leakage rate increased with increasing crosshead clearance.

31417 (CONF-831142—, pp 47-53) **Experimental evaluation of working gas containment in the automotive Stirling engine.** Cairelli, J.E.; Skog, E. (National Aeronautics and Space Administration, Cleveland, OH). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

Two United Stirling 4-95 engines were tested to evaluate the status of Automotive Stirling Engine (ASE) hydrogen working gas containment and to evaluate the use of CO_2 dopant gas to reduce heater tube permeation. The goal of the ASE is to operate for 6 months without H_2 recharge. The test results indicate the best recharge time achieved with a 4-95 engine, having minimum hydrogen piping and operating with pure H_2 at 720°C (the normal operating temperature), was 3.1 months and at 820°C (the proposed operating temperature for the ASE) was 2.1 months. By using 1% CO_2 doped H_2 the times were increased to 3.8 months and 2.7 months, respectively. Use of CO_2 dopant reduced H_2 permeation through N155 heater tubes up to 50% at 820°C with little change in maximum power and efficiency. However permeation at 820°C with N155 tubes, even with CO_2 doped H_2, is too high to achieve 6 months between recharges. Both static and dynamic piston rod seal leakage appear to be small. Leakage from static seals like O-rings are the major factor in meeting the recharge goal.

31418 (CONF-831142—, pp 55-62) **Initial testing of a variable-stroke Stirling engine.** Thieme, L.G. (National Aeronautics and Space Administration, Cleveland, OH). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072. Contract AI01-77CS51040.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

In support of the US Department of Energy's Stirling Engine Highway Vehicle Systems Program, NASA Lewis Research Center is evaluating variable-stroke control for Stirling engines. The engine being tested is the Advenco Stirling engine; this engine was manufactured by Philips Research Labs of the Netherlands and uses a variable-angle swashplate drive to achieve variable-stroke operation. The engine, initial steady-state test data taken at Lewis, and a major drive system failure and subsequent modifications are described. Finally, computer simulation results are presented to show potential part-load efficiency gains with variable-stroke control.

31419 (CONF-831142—, pp 63-72) **Stirling engine heater head stress analysis (84ASE360TR30).** Groenwall, J. (United Stirling AB, Malmoe, Sweden). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

An overview of the stress analysis work done on different heater head designs during the Automotive Stirling Engine program is presented. A close interaction between design and analysis has resulted in successive design improvements, which are discussed here. The input requirements for stress analysis of a heater head include design, loading conditions, material data, analysis method and stress criteria. The paper describes how each one of these areas has been developed during the program. Experienced structural integrity problems on the heater head components are discussed and solutions for these problems are suggested. The paper completes by looking at future plans concerning the stress analysis of heater heads.

31420 (CONF-831142—, pp 73-82) **Ceramic automotive Stirling engine conceptual design.** Chiu, W.; Darooka, D.K.; Musikant, S. (General Electric Co., Cincinnati, OH). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

General Electric Company is conducting a conceptual design study under the sponsorship of NASA-LeRC/DOE (Contract DEN 3-312) to evaluate the feasibility of a ceramic automotive Stirling engine. Using the Automotive Stirling Reference Engine design as a reference, a preliminary determination of the feasibility of using ceramic materials on the hot side of the engine is being conducted. The performance and benefits which may be derived from the use of ceramics have been estimated. Estimates of manufacturing and operating costs are being made. So far the investigation is quite favorable for the feasibility of a Ceramic Automotive Stirling Engine. The program is presently continuing with the evaluation of material processes, fabrication techniques and manufacturing cost estimation.

31421 (CONF-831142—, pp 83-92) **Free-piston Stirling engine endurance test program.** Dochat, G.; Rauch, J.; Antonelli, G. (Mechanical Technology Inc., Latham, NY). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

The Free-Piston Stirling Engine (FPSE) has the potential to be a long-lived, highly reliable, power conversion device attractive for many product applications such as space, residential, or remote-site power. The purpose of endurance testing the FPSE is to demonstrate its potential for long life. The endurance program was directed at obtaining 1000 operational hours under various test conditions: low power, full stroke, duty cycle, and stop/start. Critical performance parameters were measured to note any change and/or trend. Inspections were conducted to measure and compare critical seal-bearing clearances. The engine performed well throughout the program, completing the 1000 hours. Hardware inspection, including the critical clearances, showed no significant change in hardware or clearance dimensions. The performance parameters did not exhibit any increasing or decreasing trends. The test program confirms the potential for long-life FPSE applications. Additional testing is planned to increase the test hours to 10,000.

31422 (CONF-831142—, pp 93-96) **Low cost Stirling engines.** Beale, W. (Sunpower, Inc., Athens, OH). Mar 1984. NTIS, PC A18/MF A01. File Number DE85000072.

From Automotive technology development contractor coordination meeting; Dearborn, MI, USA (13 Nov 1983).

Simple low cost and commercially attractive Stirlings have recently evolved to the point where they deserve industry attention. By their design and intended use they avoid the exceptionally challenging difficulties of automotive and other demanding Stirling applications. The design procedures needed have quite recently become generally available, and several technically successful configurations intended for roles unaccessable to IC engines have been built and demonstrated. The time has come for the attentions of the US industry to be directed toward the promise of Stirling engines in a wide variety of simple and readily accessable nonautomotive applications.

3303 Electric-powered Systems

31423 **(DOE/CS/54209—22) Advanced vehicle systems assessment. Volume 1. Executive summary.** Hardy, K.S. (Jet Propulsion Lab., Pasadena, CA (USA)). Jan 1985. Contract AI01-78CS54209. 29p. (JPL-PUB—84-79). NTIS, PC A03/MF A01; GPO Dep. File Number DE85008643.

This report, which is divided into five volumes, documents the evaluation of advanced electric and hybrid vehicles for potential development by the early 1990's. The primary objective of the assessment is to recommend subsystem research priorities based on a comparison of alternatives as part of complete vehicle systems with equivalent performance. The assessment includes evaluations of candidate technologies as well as technical and economic comparisons of vehicle systems for specified missions. The availability of nonpetroleum fuel is also addressed, and preference analyses are used to assist in the evaluation of the relative merits of competing systems.

31424 **(DOE/NV/10103—1) City of Tucson, Arizona, electric vehicle report, April 1, 1981-May 31, 1985. Final report.** (Tucson, City of, AZ (USA)). 1985. Contract FC08-80NV10103. 22p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012774.

Results of a four-year demonstration project for electric vehicles are reported. Ten electric vehicles were used. Difficulties occurred: limited range (35 to 40 miles before recharge), and reversal of the oil crisis. The vehicles could not be used after dark, and the air conditioner could be used only sparingly. (DLC)

31425 **(EGG-SE—6764) Test plan for performance testing of the Eaton AC-3 electric vehicle.** Crumley, R.L.; Heiselmann, H.W. (EG and G Idaho, Inc., Idaho Falls (USA)). Apr 1985. Contract AC07-76ID01570. 34p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85011954.

An alternating current (ac) propulsion system for an electric vehicle has been developed and tested by the Eaton Corporation. The test bed vehicle is a modified 1981 Mercury Lynx. The test plan has been prepared specifically for the third modification to this test bed and identified as the Eaton AC-3. The scope of the EG and G testing at INEL to be done on the Eaton AC-3 will include coastdown and dynamometer tests but will not include environmental, on-road, or track testing. Coastdown testing will be performed in accordance with SAE J-1263 (SAE Recommended Practice for Road Load Measurement and Dynamometer Simulation Using Coastdown Techniques).

31426 **(EGG-ED—6725-Rev.1) Techniques to analyze vehicle coastdown data. Revision 1.** Venhuizen, J.R. (EG and G Idaho, Inc., Idaho Falls (USA)). Apr 1985. Contract AC07-76ID01570. 42p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85011953.

A method is presented in this report which uses least squares parameter estimation techniques to estimate the aerodynamic drag and rolling resistance coefficients from velocity versus time data taken during the coastdown. Central to any parameter estimation problem is a model of the process that contains the parameters of interest. A model is developed to describe the coastdown process, and an example problem is presented to show the computational methods developed for the data reduction process.

31427 **(CONF-8504116—2) Calculation of mixed depth for some metal-Si systems.** Poker, D.B. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 11p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011907.

From Workshop on ion mixing and surface alloying II; Pasadena, CA, USA (19 Apr 1985).

Results for several metals in Si indicate that the moment method is usually the preferred method for determining mixed depth, due to its insensitivity to detector resolution and lack of an initial offset. (DLC)

31428 **(DOE/ER/10556—95) Fully plastic crack problems: solutions by a penalty method that pass the consistency check. Part I.** Shih, C.F.; Needleman, A. (Brown Univ., Providence, RI (USA). Div. of Engineering). Mar 1983. Contract AC02-80ER10556. 78p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85011564.

We formulate a finite-element reduced integration penalty method applicable to plane strain problems with incompressible material behavior. This numerical method is employed to generate crack solutions for pure power hardening solids. For two configurations of interest in applications, an edge cracked panel subject to remote tension and an edge cracked panel subject to remote bending, we obtain solutions for a wide range of crack lengths and strain hardening behaviours.

31429 **(N—85-17928) Research and technology highlights of the Lewis Research Center.** (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1984. 52p. (NASA-TM—86899). NTIS, PC A04/MF A01.

Highlights of research accomplishments of the Lewis Research Center for fiscal year 1984 are presented. The report is divided into four major sections covering aeronautics, space communications, space technology, and materials and structures. Six articles on energy are included in the space technology section.

31430 **(PB—85-178051/XAB) Computerizing materials data - a workshop for the nuclear power industry. The report of a workshop held at Knoxville, Tennessee on May 2-3, 1984. Final report.** Rumble, J.; Westbrook, J.H. (National Bureau of Standards, Washington, DC (USA). Office of Standard Reference Data). Jan 1985. 48p. (NBS/SP—689). NTIS, PC A03/MF A01.

Also available from Supt. of Docs as SN003-003-02636-1. Sponsored by Metal Properties Council, Inc., New York, American Society for Metals, Metals Park, OH, American Society for Testing and Materials, Philadelphia, PA, and American Society of Mechanical Engineers, New York. Library of Congress catalog card No. 84-601161.

This report summarizes the recommendations of a Workshop in Computerized Materials Data as related to engineers in the nuclear power Industry. Four areas of discussion are featured: the content of a proposed data system; its size and data sources; the user interfaces and system capabilities; and ways of making further progress. In addition, changes in the use of materials data in the Nuclear Power Industry and progress-to-date in computerizing these data are presented.

31431 **(AERE-R—11525) Role of void nucleation in the swelling resistance of ferritic steel.** Little, E.A. (UKAEA Atomic Energy Research Establishment, Harwell. Materials Development Div.). Oct 1984. 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701457.

FV448 ferritic-martensitic stainless steel has been irradiated with 1 MeV electrons to damage levels up to 40 displacements per atom (dpa) at temperatures in the range 350 deg C to 500 deg C. The microstructures after irradiation have been evaluated and compared with those produced by fast reactor irradiations to similar dose levels. Electron irradiation induces spatially homogeneous dislocation substructures and a uniform high density of small slow-growing voids, giving low swelling rates at a peak swelling temperature of approx. 425 deg C to 450 deg C. The microstructural evolution is in marked contrast to the heterogeneous dislocation substructures and near swelling immunity observed after fast reactor irradiations. The results are discussed in terms of void nucleation events, simplified rate theory and a previously proposed model for swelling resistance of ferritic steels based on a duplex system of interstitial dislocation loop geometries. The implications of the observed microstructures on the maintenance of long-term swelling resistance of ferritic steels in both fast and fusion reactor environments are briefly considered.

31432 **(BMI—1984-053) Investigations on the behaviour of reactor pressure vessel material 20 MnMoNi 55 during heat and stress relieving treatments. Vol. 1 and 2.** Blind, D.; Schroeder-Obst, D.; Herz, K.; Maidorn, C. (Bundesministerium des Innern, Bonn (Germany, F.R.); Stuttgart Univ. (Germany, F.R.). Staatliche Materialpruefungsanstalt). Nov 1984. 268p. (In German). NTIS (US Sales Only), PC A12/MF A01. File Number DE85751129.

Variation of various heat treatment parameters with regard to forging, hardening, tempering and stress-relieving has been applied to several heats of pressure vessel steels with the aim of testing the possibility to obtain higher notch impact energy values. On one hand the variation of heat treatment parameters within the limits of the current VdTUeV material sheet 401/4 5.80 did not result in outstanding improvements of toughness. On the other hand, when employing procedures which did not correspond to the specifications, e.g. tempering up to 100 h, an evident decrease of the upper shelf and an increase of the transition temperature could be observed. Nevertheless, the specified values were generally reached. Essentially, the observations on the test materials confirm, apart from a few exceptions, the positive practical experience with the material 20 MnMoNi 5 5. Based on these relations between thoughness and forging as well as heat treatment the manufacturer obtained, in accordance with the current research program, an outstanding improvement of toughness by means of various optimization measures which had the effect of optimal, evidently increased upper shelfs and which excluded difficulties concerning acceptance criteria, e.g. too high notch impact energy transition temperatures.

31433 **(BMI—1984-054) Exemplary representation of structural constitutions of steels used for nuclear power plant components, with particular emphasis on welding and heat treatment (5. technical report. Pt. 1).** Schroeder-Obst, D.; Kuppler, D. (Bundesministerium des Innern, Bonn (Germany, F.R.); Stuttgart Univ. (Germany, F.R.). Staatliche Materialpruefungsanstalt). Nov 1984. 125p. (In German). NTIS (US Sales Only), PC A06/MF A01. File Number DE85751137.

This 5th part of the technical report characterizes the nuclear reactor structural steels 22 NiMoCr 3 7, 20 MnMoNi 5 5, and 17 MnMoV 6 4 and their melts and constitution under heat treatment within the margin of the approved VdTUeV specifications, as well as under extreme conditions (melt compositions exceeding the limiting value, heat treatments beyond official VdTUeV regulations), as well as specimens simulating the heat-affected zones of such steels. The information is presented by means of metallographic structural characteristics, by microstructural characteristics, and by the corresponding mechanical and technological characteristic values, and by showing the interdependencies between these features. Thus this report, when the data are complete, offers the possibility of fully assessing and classifying steels used for nuclear power plant components with regard to materials structure and their behaviour in welded zones.

31434 **(BNL—36414) Methane-bubble formation in hydrogen-charged Fe-30 ppM C.** Snead, C.L. Jr.; Lynn, K.G.; Suenaga, M. (Brookhaven National Lab., Upton, NY (USA)). 1985. Contract AC02-76CH00016. 4p. (CONF-850169—13). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012526.

From 7. international conference on positron annihilation; New Delhi, India (6 Jan 1985).

We have used positrons as a probe of the early-stage growth of methane bubbles in hydrogen-charged polycrystalline Fe. Ferrovac E (30 ppM C) was charged at 900 psi of H_2 at 475°C for various times to generate the methane internally. It is known that this process generates methane bubbles. Our results show that, even at very early bubble-growth stages, dislocations are generated. A lifetime definitely associated with trapping at bubbles is not observed, due either to trapping by dislocations that are generated and which can "screen" the bubbles, or by passivation of the bubbles as positron traps by the presence of hydrogen or methane in them. 11 refs., 5 figs.

31435 **(BNL—36570) Noble metals as incipient transition metals.** Watson, R.E.; Bennett, L.H. (Brookhaven National Lab., Upton, NY (USA); National Bureau of Standards, Washington, DC (USA)). 1985. Contract AC02-76CH00016. 13p. (CONF-850211—9). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013283.

From 114. AIME annual meeting (includes Society of Mining Engineers); New York, NY, USA (24 Feb 1985).

This review is concerned with similarities and differences between noble and transition metal alloying. Two classes of experiments are inspected: impurity Moessbauer isomer shifts and photoemission of core and valence electron levels. At first glance they would appear to be in conflict concerning the direction of any charge transfer. In noble metal alloys this is associated with changes in d-electron count which are compensated by the non-d electrons. The sign of the change in d occupation is readily understood in terms of d band hybridization. The normalized isomer shifts show that the balance of d and non-d transfer terms must vary across a transition metal row and that while the noble metals, when acting as impurities, act much like the transition elements immediately adjacent to them, the charge transfer, when the noble metals are hosts, is quite different. These observations, taken with recent band theory population analyses, indicate that three charge transfer terms, those associated with d, s and p-like charge, have visible effects on alloying properties. The review also considers the long standing discrepancy between the elemental fcc-bcc structural energy differences of Kaufman and Bernstein which are standardly employed in phase diagram constructs versus those appropriate to the Engel-Brewer model of transition and noble metals. Comparison with recent 5d metal estimates, based on electron band theory total energy calculations, show one region of agreement with the Engel-Brewer values and another of agreement with Kaufman and Bernstein.

31436 **(CBPF-NF—013/83) Critical point of the fully-anisotropic quenched bond-random Potts ferromagnet in triangular and honeycomb lattices.** Tsallis, C.; Santos, R.J.V. dos. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 21p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701418.

On conjectural grounds an equation that provides a very good approximation for the critical temperature of the fully-anisotropic homogeneous quenched bond-random q-state Potts ferromagnet in triangular and honeycomb lattices is presented. Almost all the exact particular results presently known for the square, triangular and honeycomb lattices are recovered; the numerical discrepancy is quite small for the few exceptions. Some predictions that we believe to be exact are made explicit as well.

31437 (CEA-CONF—7390) **Semimetallic behaviour of SmS at high pressure.** Konczykowski, M.; Lapierre, F.; Haen, P.; Morillo, J.; Senateur, J.P. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France)). Aug 1984. 14p. (CONF-840876—5). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751301.

From International conference on valence fluctuations; Koln, F.R. Germany (27 Aug 1984).

The transition from semiconducting to metallic intermediate-valence behaviour occuring at 20 kbar in SmS is studied by resistivity and Hall-coefficient measurements (1.2<=T<=300 K, 4<=P<=21 kbar). The data are analyzed in a two-band-conduction model. It is concluded that an indirect band gap closes at 20 kbar and that a direct one persists above this transition.

31438 (CONF-8504115—4) **Fermi surface study of CeSb in the ferromagnetic and antiferromagnetic phases** . Aoki, H.; Crabtree, G.W.; Joss, W.; Hulliger, F. (Argonne National Lab., IL (USA)). Feb 1985. Contract W-31-109-ENG-38. 12p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012122.

From 5. international conference on crystalline field effects in f-electron systems: ICCF5; Sendai, Japan (15 Apr 1985).

We report a de Haas-van Alphen effect study of CeSb in the intermediate field antiferromagnetic phase and in the high field ferromagnetic phase. The experimental results are discussed in the light of the p-f mixing model and a new weak coupling model based on a band structure calculation with localized f orbitals.

31439 (CONF-8504116—3) **Survey of mixing in metal/insulator systems.** Appleton, B.R. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 10p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011938.

From Workshop on ion mixing and surface alloying II; Pasadena, CA, USA (19 Apr 1985).

The conclusions from this survey to date are: Ion beam mixing (and pulsed laser mixing*) are valuable methods to induce interface interactions at low temperatures. In many cases one can control and tailor stoichiometries of mixing. In some cases ion beam (and pulsed laser) mixing can "initiate" reactions not possible by thermal processing. Nevertheless, equilibrium thermodynamic or chemical considerations have a much greater influence in dictating materials interactions (phase formation) than any nonequilibrium aspects of ion bombardment.

31440 (CONF-8505138—1) **Flux-line lattice anisotropy in V_3Si: observation and interpretation.** Christen, D.K.; Kerchner, H.R.; Sekula, S.T.; Chang, Y.K. (Oak Ridge National Lab., TN (USA)). Apr 1985. Contract AC05-84OR21400. 16p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011935.

From Materials and mechanisms of superconductivity conference; Ames, IA, USA (29 May 1985).

The high-T/sub c/ A15 compound V_3Si belongs to a small class of intrinsically high-κ, clean, type-II superconductors. For such a material in the low-field mixed state, the inter-flux-line forces are dominated by the microscopic field interaction. We have observed directly manifestations of anisotropic flux line (FL) interactions by means of small-angle neutron scattering (SANS) from the flux-line lattice (FLL) in a high quality single crystal of V_3Si. Pronounced correlations were found between the FLL morphology (orientation and symmetry) and the symmetry of the real crystal (CL) axis parallel to the applied field. Morover, for a fixed sample orientation in the field, we observe changes in the FLL symmetry with flux density B. We have interpreted the data in terms of weak nonlocality in the electrodynamic response, and anisotropy in the Fermi surface and electron-phonon interaction of the cubic material. A reciprocal space power series expansion for the mixed state free energy is obtained and fitted to the observed FLL morphology. The results are compared with those of previously measured H/sub c2/ and gap anisotropy.

31441 (DOE/AL/18071—T5) **[Beryllium production. Monthly technical progress report, 1 April-5 May 1985].** (Brush Wellman, Inc., Cleveland, OH (USA)). [1985]. Contract AC04-82AL18071. 9p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013360.

This Monthly Technical Progress Report for the period 1 April 1985 through 5 May 1985, summarizes progress on Task IV of DOE Contract DE-AC04-82AL18071 for Research and Development Study for the optimization of beryllium production operations for government purposes. Task IV is operation of the subscale demonstration models of recommended alternative beryllium production processes.

31442 (DOE/ER/06039—T2) **Hydrogen embrittlement testing. [Final report].** (Virginia Polytechnic Inst. and State Univ., Blacksburg (USA)). [1985]. Contract AS05-78ER06039. 3p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85007352.

Several important hydrogen induced effects were established. These effects included the observation of hydrogen-induced weakening of interfacial strength of boundaries such as twin boundaries, grain boundaries and slip bands. Impact and slow bend testing of hydrogen charged samples illustrated that this weakening is inherent with hydrogen absorption and that dislocation transport of hydrogen is not necessary for interfacial embrittlement to occur. These observations helped establish a phenomenological model for hydrogen embrittlement.

31443 (DOE/ER/45035—1) **Effect of microstructure on the fatigue behavior of Fe-C-X alloys. Final report, July 1, 1983-November 16, 1984.** Shiflet, G.J.; Jata, K.V.; Starke, E.A. Jr. (Virginia Univ., Charlottesville (USA). Dept. of Materials Science). Mar 1985. Contract AS05-83ER45035. 71p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85011749.

Purpose of the research is to establish the effect of microstructure on fatique behavior by controlling the relationship between ferrite, martensite, and carbides in ternary steels. Three alloys are being studied: Fe-0.2C-1Mn; Fe-0.2C-2Mo; Fe-0.2C-4Mo. The roles of austenite (martensite) and ferrite are being studied. 52 figs. (DLC)

31444 (DOE/ER/45096—1) **Stability of amorphous metal films on semiconductor substrates. Progress report, July-December 1984.** Wiley, J.D.; Perepezko, J.H. (Wisconsin Univ., Madison (USA)). Jan 1985. Contract FG02-84ER45096. 6p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012401.

Goals were the examination of structural relaxation, measurement of diffusion in the amorphous films following relaxation to an isoconfigurational state, investigation of the stability of amorphous metals against electromigration, and assessment of crystallization and phase separations. Amorphous metals studied included Ni-Nb, W-Si, and Mo-Si. (DLC)

31445 (DOE/ER/45142—1) **Very low temperature studies of hyperfine effects in metals. [Progress report].** Weyhmann, W. (Minnesota Univ., Minneapolis (USA). School of Physics and Astronomy). 1985. Contract FG02-84ER45142. 10p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013367.

We are using nuclei through the hyperfine coupling as a probe of magnetic interactions in metallic systems, emphasizing the role conduction electrons play. Three types of systems are of interest to us: nuclear singlet ground state intermetallic compounds, very dilute magnetic impurities in non-magnetic metals, and itinerant ferromagnets. The nuclear ordering in singlet ground state alloys of praseodymium appears to be analogous to electronic ordering in rare earth metals, with the RKKY interaction moderating the indirect exchange in both cases. We are measuring the static and dynamic properties of these materials both to study rare earth ordering, since only first order effects should play a role in the nuclear case, and to develop the sub-millikelvin refrigeration capabilities of these materials. Using this cooling power, we propose studying the local moment of Mn based Kondo systems at millikelvin and sub-millikelvin temperatures. Kondo systems with a Kondo temperature below 0.1 K have the advantage that magnetic saturation can be achieved with available magnets. We propose studying both the local magnetization as measured with nuclear orientation and the macroscopic magnetization measured with SQUID magnetometry. We also propose searching for electron polarization effects in itinerant ferromagnets using nuclear orientation. Induced hyperfine fields of less than 1 k0e can be detected at 1 mK.

31446 (DOE/ET/52023—34) **Simulating the CTR environment in the HVEM. Final report, September 1, 1975-August 31, 1984.** Jesser, W.A. (Virginia Univ., Charlottesville (USA). Dept. of Materials Science). 1984. Contract AS05-76ET52023. 18p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011745.

The first high voltage electron microscope-ion accelerator facility in the world was established in 1976. Through use of this facility, helium embrittlement as revealed through intergranular fracture was shown to be independent of helium bubble content in the grain boundaries. This result is contrary to most current thinking and theories of helium embrittlement. The most likely mechanism of helium embrittlement is a plastic deformation assisted distribution of helium in finely dispersed helium-vacancy clusters. The key to overcoming helium embrittlement should lie in preventing the fine dispersion by providing benign sinks or treatments that agglomerate the helium.

31447 (GKSS—84/E/47) **Effect of damage rates and different kinds of irradiation on the ductility of amorphous $Fe_{40}Ni_{40}B_{20}$.** Gerling, R.; Schimansky, F.P.; Wille, P.; Wagner, R. (GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.)). 1984. 11p. (CONF-840902—19). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751617.

From 5. ASTM-Euratom symposium on reactor dosimetry; Geesthacht, F.R. Germany (24 Sep 1984).

Thermally embrittled amorphous $Fe_{40}Ni_{40}B_{20}$ reveals a complete restoration of the ductility upon low dose neutron irradiation. The improvement of the ductility is studied both as a function of the damage type as caused either by thermal or by fast neutrons, and of the damage rate. While the damage rate has no influence, the type of irradiation strongly influences the damage level at which the ductility of amorphous $Fe_{40}Ni_{40}B_{20}$ is completely restored.

31457 (IAE—3774/11) **Role of mechanical stress in materials alloying by ion implantation.** Titov, V.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1983. 48p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701035.

The generation of mechanical stresses in a solid by implantation alloying and other substantially nonequilibrium methods of implantation of impurity atoms are considered. The problems of mechanical strength of the alloyed layers, methods of excessive stresses release and the effect of these stresses on the redistribution of the implanted impurity are discussed. It has been found that in many cases the effect of strain-induced intruding of the impurity can play a noticeable role in shaping the profile of impurity distribution. This pertains to the implantation of ions of ultralow energies, implantation of great doses knocking in alloying, pulsed thermal treatment of implantation layers.

31458 (IAE—3815/10) **Investigation into temperature dependence of specific heat of $Zr_{70}Be_{30}$ superconductive system in amorphous and crystalline, states in the temperature range of 100 to 500 K.** Panova, G.Kh.; Chernoplekov, N.A.; Shikov, A.A.; Kemen', T.; Fogarashi, B.; Tsiraki, A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1983. 9p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701033.

Thermal capacity of superconducting $Zr_{70}Be_{30}$ system in amorphous and metastable crystalline state in the range of 100-500 K is measured; kinetics of transition from amorphous phase into metastable and stable crystalline state is studied. It is shown that during amorphization Debye temperature THETAsub(BT) falls while the coefficient of electron thermal capacity rises, which is conditioned by moderation of phonon spectrum and increase in electron state density.

31459 (INDC(NDS)—128/GR) IAEA advisory group meeting on nuclear data for radiation damage assessment and related safety aspects, Vienna, 12-16 October 1981. Summary report. Kocherov, N. (ed.). (International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee). Jan 1982. 14p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701036.

This advisory group meeting on nuclear data for radiation damage assessment and related safety aspects was convened by the IAEA Nuclear Data Section, at IAEA Headquarters in Vienna, Austria, from 12-16 October 1981. The meeting was attended by 34 participants from 15 countries and 2 international organizations. The main objective of the meeting was to review the requirements for and the status of nuclear data needed for radiation damage estimates in reactor structural materials and related reactor safety aspects, and to develop recommendations to the Nuclear Data Section of the IAEA for its future activities in this field.

31460 (INIS-mf—9294) Radiation damage in $Al^{57}Co$ caused by 25 MeV oxygen ions: Establishment of a dose curve on the basis of Moessbauer effect and resistance measurements. Zeman, N. (Erlangen-Nuernberg Univ., Erlangen (Germany, F.R.). Naturwissenschaftliche Fakultaet 1 - Mathematik und Physik). 13 Feb 1984. 73p. (In German). NTIS (US Sales Only), PC A04/MF A01. File Number DE85780932.

With 65 refs.

Doped foils of aluminium with ^{57}Co have been irradiated, with O_3-ions of 25 MeV at a temperature of 100K. The Moessbauer effect and the electrical resistivity were investigated at 4,2 K in order to obtain valuable information on the behaviour of created point defects, e.g. the clustering of interstitials at Co-atoms and their dose dependence. It was found that clusters exceeding a critical size grow and do not anneal out contrary to the behaviour of smaller interstitial clusters. (orig.).

31461 (JAERI-M—83-224) Design fatigue curve for Hastelloy-X. Nishiguchi, Isoharu; Muto, Yasushi; Tsuji, Hirokazu. (Japan Atomic Energy Research Inst., Tokyo). Dec 1983. 44p. (In Japanese). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701031.

In the design of components intended for elevated temperature service as the experimental Very High-Temperature gas-cooled Reactor (VHTR), it is essential to prevent fatigue failure and creep-fatigue failure. The evaluation method which uses design fatigue curves is adopted in the design rules. This report discussed several aspects of these design fatigue curves for Hastelloy-X (-XR) which is considered for use as a heat-resistant alloy in the VHTR. Examination of fatigue data gathered by a literature search including unpublished data showed that Brinkman's equation is suitable for the design curve of Hastelloy-X (-XR), where total strain range Δ epsilon sub(t) is used as independent variable and fatigue life Nsub(f) is transformed into log(log Nsub(f)).

31462 (JAERI-M—84-014) Low-cycle fatigue of Hastelloy X and Hastelloy XR in simulated VHTR helium coolant environment at elevated temperature. Tsuji, Hirokazu; Kondo, Tatsuo. (Japan Atomic Energy Research Inst., Tokyo). Feb 1984. 33p. (In Japanese). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701032.

Strain-controlled low-cycle fatigue tests were conducted on Hastelloy X and its modified version, Hastelloy XR, at 900 sup(o)C in the flowing simulated VHTR helium environment. The results of this study provide the following conclusions; 1) Hastelloy X and Hastelloy XR exhibited essentially the same low-cycle fatigue characteristics under the given test conditions, where marked difference was observed in the oxidation performance between those materials. The results obtained in the present work were in good accordance with the following equation proposed by Manson and Coffin Δ epsilon sub(t) = Δ epsilon sub(e) + Δ epsilon sub(p) = 0.00228 Nsub(f)sup(-0.00732) + 0.447 Nsub(f)sup(-0.604) 2) The ratio of Nsup(f) in impure helium to Nsup(f) in 1–3 x 10^{-6} Pa vacuum were examined, and the results were equally about 0.7 for both materials. 3) Both transgranular fracture mode with ductile striations and intergranular fracture mode were recognized in the fracture surfaces, with the former mode being predominant. 4) The results obtained in the present work were situated on the line corresponding to the approximate average level of the available fatigue data in literature on Hastelloy X tested under similar test conditions.

31463 (Juel—1923) High-temperature helium embrittlement (T>=0,45Tsub(M)) of metals. Batfalsky, P. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Festkoerperforschung; Technische Hochschule Aachen (Germany, F.R.)). Jun 1984. 103p. (In German). NTIS (US Sales Only), PC A06/MF A01. File Number DE85751139.

Thesis.

High temperature helium embrittlement, swelling and irradiation creep are the main technical problem of fusion reactor materials. The expected helium production will be very high. The helium produced by (n,α)-processes precipitates into helium bubbles because its solubility in solid metals is very low. Under continuous helium production at high temperature and stress the helium bubbles grow and lead to intergranular early failure. Solution annealed foil specimens of austenitic stainless steel AISI 316 were implanted with α-particles: 1. during creep tests at 1023 K (in-beam test) 2. before the creep tests at high temperature (1023 K). The creep tests have been performed within large ranges of test parameter, e.g. applied stress, temperature, helium implantation rate and helium concentration. After the creep tests the microstructure was investigated using scanning (SEM) and transmission (TEM) electron microscopy. All the helium implanted specimens showed high temperature helium embrittlement, i.e. reduction of rupture time tsub(R) and ductility epsilonsub(R) and evidence of intergranular brittle fracture. The in-beam creep tests showed greater reduction of rupture time tsub(R) and ductility than the preimplanted creep tests. The comparison of this experimentally obtained data with various theoretical models of high temperature helium embrittlement showed that within the investigated parameter ranges the mechanism controlling the life time of the samples is probably the gas driven stable growth of the helium bubbles within the grain boundaries.

31464 (Juel—1939) Effect of test atmosphere on the formation and propagation of creep cracks in commercial high temperature alloys. Yun, H.M.; Schuster, H.; Ennis, P.J.; Nickel, H. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorwerkstoffe und Heisse Zellen; Technische Hochschule Aachen (Germany, F.R.)). Jul 1984. 197p. (In German). NTIS (US Sales Only), PC A09/MF A01. File Number DE85751128.

Thesis by H.M. Yun.

The influence of surface cracks caused by corrosion on the creep rupture properties of the alloys INCOLOY 800H and INCONEL 617 has been investigated for temperatures in the range 1073 K to 1223 K. The test environments were air and impure helium simulating the primary coolant gas of a high temperature reactor (HTR helium). The depths of surface cracks in creep test specimens were measured metallographically and a characteristic crack depth, a_{90}, was derived. a_{90} is defined so that 90% of the cracks present have depths below a_{90}. The dependence of a_{90} on test time, creep strain and stress was examined. The growth of creep cracks at the specimen surface as a function of the creep strain was described analytically. This allowed the stress increase due to loss of specimen cross section by surface crack formation to be estimated. It was shown that the surface cracks resulting from corrosion lead to an increase in the creep rate at creep strains above 5%, but the increases were similar in both atmospheres. Rupture of the specimens occurred when the surface cracks and voids developed inside the specimen due to the creep damage processes. This is the main reason for the similar creep rupture properties of the alloys in the two test environments. Finally, a method has been developed to allow the plotting of the depth of surface cracks caused by corrosion with the stress-rupture curves. In this type of diagram, the damage resulting from surface cracks can be related to the creep rupture data to indicate whether corrosion effects need to be considered in the derivation of design stresses.

31465 (KFK—3802) **Examination of transpassive nitric acid corrosion behavior of different austenitic stainless steels by prolongated Huey-testing (65% HNO_3, 120°C, 720 h).** Kraft, R.; Leistikow, S.; Pott, E. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Wiederaufarbeitung und Abfallbehandlung). Nov 1984. 99p. (In German). (PWA—74/84). NTIS (US Sales Only), PC A05/MF A01. File Number DE85751134.

The aim of these experiments was to test the quality and the ability to longtime service conditions of various austenitic stainless steels of type CrNi1810 CrNi 2520 by ASTM Standard Huey-Test, prolongated up to 15 periods of 48 h each. By gravimetry the rate of metal loss, by metallography the maximum depth of local dissolution, by microscopy the overall appearance of the corroded surface was checked and evaluated. The best corrosion behavior was shown by the low carbon 2520 CrNi stainless steels in the fine-grain, highly pure, solution annealed condition, not showing any trend to accelerated corrosion when sensitizing heat treatment or long-time exposure were applied. The prolonged Huey-Test proved to be a sensitive method to evaluate the corrosion behavior of steels for engineering purposes, especially the effects caused by the main alloy components, small impurity concentrations, and differences in homogenity of the bulk structure. Thus, in combination with the evaluation of local intercrystalline dissolution (penetration) in the metallographic cross-section, differences in quality can be determined and long-term loss of wall thickness roughly estimated. 26 figures.

31466 (KFK—3819) **Experiments for liquid metal embrittlement of fusion reactor materials by liquid lithium.** Grundmann, M.; Borgstedt, H.U. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung; Kaiserslautern Univ. (Germany, F.R.)). Oct 1984. 195p. (In German). NTIS (US Sales Only), PC A09/MF A01. File Number DE85751132.

Thesis.

The liquid metal embrittlement behaviour of two martensitic-ferritic steels [X22CrMoV121 (Nr. 1.4923) and X18CrMoVNb 121 (Nr. 1,4914)] and one austenite chromium-nickel-steel X5CrNi189 (Nr. 1.4301) was investigated. Tensile tests in liquid lithium at 200 and 250°C with two different strain rates on precorroded samples (1000 h at 550°C in lithium) were carried out. Reference values were gained from tensile tests in air (RT, 250°C). It is concluded that there is sufficient compatibility of the austenitic steel with liquid lithium. The use of the ferritic-martensitic steels in liquid lithium on the other hand, especially at temperatures of about 550°C, seems to be problematic. The experimental results led to a better understanding of LME, applying the theory of this material failure.

31467 (LA-UR—85-1648) **Superconductivity in the W-Tc and W_2C-Tc systems.** Giorgi, A.L. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 11p. (CONF-8505138—4). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012711.

From Materials and mechanisms of superconductivity conference; Ames, IA, USA (29 May 1985).

A series of compositions in the W-Tc, W_2C-Re and W_2C-Tc systems were prepared and examined for superconductivity. The crystal structure, lattice parameters and superconducting transition temperatures of the W_2C-Tc are reported for the first time. Similar measurements were made on the W-Tc and W_2C-Re systems and the results compared with previous published results for these systems. 7 refs., 2 figs., 2 tabs.

31468 (LBL—18457) **Near-threshold fatigue: an overview of the role of microstructure and environment.** Ritchie, R.O. (Lawrence Berkeley Lab., CA (USA)). Sep 1984. Contract AC03-76SF00098. 64p. (CONF-8409121—2). NTIS, PC A04/MF A01; GPO Dep. File Number DE85009903.

From 2. international conference on fatigue thresholds - Fatigue 84; Birmingham, UK (3 Sep 1984).

An overview is presented of the salient micro-mechanisms, primarily involving crack closure, which can influence the growth of fatigue cracks at near-threshold levels. Examples are drawn from recent work on crack propagation in dual-phase and low alloys steels and in under/peak/overaged aluminium alloys. Factors such as duplex microstrucures, variations in slip mode, high pressure hydrogen environments and compression overloads are shown to modify changes in near-threshold crack growth behavior.

31469 (LBL—19286) **Atomic mechanisms of γ′ precipitate plate growth in the Al-Ag system.** Howe, J.M. (Lawrence Berkeley Lab., CA (USA)). Mar 1985. Contract AC03-76SF00098. 324p. NTIS, PC A14/MF A01; 1; GPO Dep. File Number DE85012558.

Energy-dispersive x-ray spectroscopy results that the precipitates have the composition Ag_2Al. High-resolution electron microscopy of γ′ precipitates in both <110>//<1120> and <111>//<0001> orientations shows that all interfaces of the precipitate are largely coherent with the matrix and are faceted along low-energy (111) and (110) matrix plans, due to the influence of surface and elastic strain energies on the transformation. Further comparison between experimental and calculated high-resolution images of the precipitate/matrix interface and of Shockley partial dislocation ledges on the precipitate faces demonstrates that both thickening and lengthening of γ′ precipitate plates occurs by the passage of the Shockley partial dislocations along alternate (111) matrix planes by a terrace-ledge-kink mechanism. These images and electron diffraction information also indicate that the γ′ precipitates are ordered, where the A-planes in the precipitate contain nearly pure Ag and the B-planes have the composition Al_2Ag, and that the limiting reaction in the growth process is the substitutional diffusion of Ag cross kinks in the Shockley partial dislocations, which terminate in the Ag-rich A-planes. The terraces between ledges are atomically flat and ledges are uniformly stepped-down from the centers to the edges of isolated precipitates. Convergent-beam electron diffraction (CBED) analyses of γ′ precipitates indicate that they have the space group $P6_3$/mmc. Effect of specimen thickness on symmetry determinations by CBED was also examined for an α-titanium sample. Results show that the symmetries observed in CBED patterns from thin specimens may be due to the limited thickness of the specimen, rather than to the actual space group of the material.

31471 (NUREG/CR—3900-Vol.3) **Long-term performance of materials used for high-level waste packaging. Third quarterly report, Year Three, October-December 1984. Vol. 3.** Stahl, D.; Miller, N.E. (comps.). (Battelle Columbus Labs., OH (USA)). May 1985. 82p. NTIS, PC A05/MF A01 - GPO. File Number TI85901514.

As part of the Nuclear Regulatory Commission's requirement to assess the Department of Energy's application to construct geologic repositories for storing high-level radioactive waste, Battelle's Columbus Laboratories is investigating the long-term performance of materials used for high-level waste packaging. Experiments for evaluating the glass-dissolution model are under way, and the procedure developed last quarter for dispersing RuO_2 in MCC 76-68 glass has been tested and proved to produce appropriate particle concentrations. Acetic and humic acids have been chosen to test the effect of natural organic acids on waste-glass performance. In the overpack-corrosion effort, potentiodynamic polarization tests indicate that of the 15 chemical species tested, all but perchlorate and hydrogen may affect stress-corrosion cracking behavior of carbon steel; several synergistic effects were also indicated. In slow strain rate studies, specimens tested in 0.0005 M $FeCl_3$ (a much lower chloride concentration than expected in groundwater) exhibited significant cracking over the temperature range 250 to 315°C. Pits were found to propagate readily, but slowly, in 1018 carbon steel exposed to aerated basalt groundwater at 90°C. The general-corrosion correlation was changed to incorporate a finite rate of film growth. Integral experiments are being prepared to provide information on combined-effects processes that may influence the long-term performance of the waste package. 26 refs., 17 figs., 16 tabs.

31472 (NUREG/CR—4092) **ORNL characterization of Heavy-Section Steel Technology Program plates 01, 02, and 03.** Stelzman, W.J.; Berggren, R.G.; Jones, T.N. Jr. (Oak Ridge National Lab., TN (USA)). Apr 1985. Contract AC05-84OR21400. 168p. (ORNL/TM—9491). NTIS, PC A08/MF A01 - GPO. File Number TI85011249.

Charpy V-notch impact, tensile, and drop-weight data are presented for three 305-mm-thick (12-in.) A 533 grade B class 1 steel plates. The effects of specimen size and orientation were examined as well as the variation of properties between different plate locations and depths. Some observations based on data obtained from an instrumented Charpy testing machine are also presented.

31473 (ORNL/TM—9573) **Characterization of modified 9 Cr-1 Mo steel sand castings.** Sikka, V.K. (Oak Ridge National Lab., TN (USA)). Apr 1985. Contract AC05-84OR21400. 33p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012057.

Experience with the sand casting of modified 9 Cr-1 Mo steel at several foundries is presented. The castings included simple blocks, elbows, valve bodies, and a steam chest. Castings were characterized by tensile and Charpy impact tests, for the effects of thermal aging on Charpy impact properties and hardness, and by creep, fatigue, and microstructure. Properties of the castings were compared with those observed for wrought material. In general, mechanical properties of castings were slightly lower than those of the wrought material.

31474 (OUEL-R—1309/80) **Effect of strain rate and temperature on the tensile behaviour of uranium - 2sup(w)/o molybdenum.** Harding, J.; Boyd, G.A.C. (Oxford Univ. (UK). Dept. of Engineering Science). 1983. 19p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701455.

This report describes the uniaxial tensile behaviour of uranium 2 w/o molybdenum alloy over a wide range of temperature and strain rate. Specimen blanks taken from co-reduced and extruded U2 w/o Mo rods were given one of two heat treatments. Longitudinal tensile test pieces, taken from these blanks at near surface locations were tested in the temperature range -150 deg C to +100 deg C at strain rates from quasistatic (10^{-4} s^{-1}) to 10^{3} s^{-1}. To achieve this range of testing rates three machines were required: an Instron screw driven machine for rates up to 0.1 s^{-1}, a second specially constructed hydraulic machine for the range 0.1 s^{-1} to 50 s^{-1} and a drop weight machine for the highest strain rates. The ways in which the mechanical properties - elongation to fracture, flow stresses and ultimate tensile stress - vary with both temperature and strain rate are presented and discussed for material in both heat treatment conditions.

31475 (OUEL-R—1492/83) **Effect of cooling rate from the γ-phase on the strain-rate sensitivity of a uranium 2 sup(w)/o molybdenum alloy.** Boyd, G.A.C.; Harding, J. (Oxford Univ. (UK). Dept. of Engineering Science). 1983. 51p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85701456.

Tensile tests have been performed at strain rates from 10^{-4} to about 2000/s and temperatures from -150 deg C to +250 deg C on a uranium 2 w/o molybdenum alloy which had been aged for 2 hours at 500 deg C after a fast gas cool from the γ-phase at a controlled rate of 40 deg C/minute. The results are compared with those for standard as-extruded material which had received the same aging treatment. Stress-strain curves are presented and the effect of strain rate and temperature on the flow stress, the ultimate tensile stress and the elongation to fracture is determined. A thorough structural characterisation of the specimen materials, using X-ray analysis and scanning and transmission electron microscopy, allows the different mechanical responses to be related to the corresponding microstructural state of the material. Flow stress data at different temperatures and strain rates are analysed in terms of the theory of thermally-activated flow and estimates made of the various activation parameters.

31476 (RFP—3728) **Interaction of trace elements and welding parameters on GTA weld shape.** Burgardt, P.; Heiple, C.R. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). [1985]. Contract AC04-76DP03533. 4p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85004046.

Good penetration and poor penetration steels have different responses to changes in temperature distribution on the weld pool surface. Penetration of 304 SS was varied using S and Se dopants. The weld parameter investigated was the electrode tip angle. Results of bead-on-plate GTA welds show that there is a difference in response of weld pool shape to tip angle depending on penetration: Low penetration base metal showed no dependence, intermediate penetration steel showed a small linear decrease of weld depth-to-width ratio (d/w) with tip angle, while high penetration steel showed an increase of d/w up to a maximum at about 50°, followed by a decrease in d/w. (DLC)

31477 (RHO-RE-ST—31P) **Review of zirconium-zircaloy pyrophoricity.** Cooper, T.D. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Nov 1984. Contract AC06-77RL01030. 28p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85011169.

Massive zirconium metal scrap can be handled, shipped, and stored with no evidence of combustion or pyrophoricity hazards. Mechanically produced fine scrap such as shavings, turnings, or powders can burn but are not pyrophoric unless the particle diameter is less than 54 μm. Powders with particle diameters less than 54 μm can be both pyrophoric and explosive. Pyrophoric powders should be collected and stored underwater or under inert gas cover to reduce the flammability hazard. Opening sealed containers of zirconium stored underwater should be attempted with caution since hydrogen may be present. The factors that influence the ignition temperature have been explored in depth and recommendations are included for the safe handling, shipping, and storage of pyrophoric or flammable zirconium. 29 refs., 5 figs., 6 tabs.

31478 (SAND—84-1876-Vol.1, pp 211-234) **Effect of titanium content on quench rate sensitivity and aging response in U-Ti alloys.** Eckelmeyer, K.H.; Chapman, L.R.; Romig, A.D. Jr. (Sandia National Labs., Albuquerque, NM). Jan 1985. No Distribution. Refer request to Sandia. File Number TI85027162. (CONF-8310370—Vol.1). Contract AC04-76DP00789.

From JOWOG 22 uranium alloy meeting; Albuquerque, NM, USA (11 Oct 1983).

The critical quench rate required to suppress diffusional decomposition of the γ-phase and obtain martensitic microstructures varies dramatically with titanium content. The microstructures and mechanical properties of very rapidly quenched material also vary substantially with Ti content. Very rapidly quenched materials are age hardenable, and the extent of aging response increases with increasing amount of martensite. Tensile tests on material that was age hardened after being fully quenched indicate that the best combinations of yield strength and ductility can be obtained in the higher titanium alloys. Quench rate sensitivity problems, however, will restrict applications of these alloys to very thin sections. For most applications it appears that titanium contents in the 0.6 to 0.75% range offer the best combinations of quenchability and mechanical properties.

31479 (SAND—84-1876-Vol.1, pp 235-248) **Computer simulations for predicting the quench behavior of uranium and uranium-0.75 titanium alloys.** Ludtka, G.M.; Chapman, L.R.; Llewellyn, G.H. (Oak Ridge Y-12 Plant, TN). Jan 1985. No Distribution. Refer request to Sandia. File Number TI85027162. (CONF-8310370—Vol.1). Contract W-7405-ENG-26.

From JOWOG 22 uranium alloy meeting; Albuquerque, NM, USA (11 Oct 1983).

One- and two-dimensional (R,Z) models for the analysis of the quenching behavior of uranium have been generated. These models incorporate the temperature-dependent heat transfer and thermophysical properties, and stress the importance of the enthalpy of transformation. The latter has been shown to contribute as much as one third of the heat that must be removed upon quenching. In addition, local increases in temperature which can alter the final microstructure and residual stress can be predicted by the computer simulation by taking into account phase transformation effects. The results and implications of this research endeavor will be reviewed. In addition, current efforts to expand the modeling to three dimensions and to the uranium-0.75 titanium (U-0.75Ti) alloy will be outlined. The goal of this research is to develop the ability to predict the final microstructure and residual stress profile for specific quenching techniques and part geometries.

31480 (SAND—84-1876-Vol.1, pp 249-257) **Effect of cold work on the tensile properties of U-2 Mo.** Edwards, K.L.; Turner, G.I.; Dunn, M.K. (Atomic Weapons Research Establishment, Aldermaston, England). Jan 1985. No Distribution. Refer request to Sandia. File Number TI85027162. (CONF-8310370—Vol.1).

From JOWOG 22 uranium alloy meeting; Albuquerque, NM, USA (11 Oct 1983).

Cast co-reduced depleted U-2 Mo was extruded in a copper sheath at 850°C through a 35 mm die (17:1 ratio) to provide bar stock for this study. De-clad sections of bar were vacuum heat treated at 800°C for 3 h, fast gas quenched in recirculating argon and aged 2 h at 500°C (AWRE HT2). The bar lengths were then cold swaged from 32 mm dia to various area reductions in the range 9% to 36%, in single and two stages. This material was evaluated for both hardness and quasistatic tensile properties. The UTS increases smoothly with increasing amounts of area reduction from 163 kpsi at zero reduction to 221 kpsi at 32% area reduction. Beyond this, at 36% reduction, the strength is reduced. As expected there is a concurrent decrease in tensile elongation, which falls rapidly from the unworked level of ~12% to ~3% at 10% area reduction. The Vickers hardness/degree of swaging relationship is a smooth curve of similar form to the UTS - cold work curve, the hardness rising smoothly from 366 VPN to a peak of 391 VPN at 32% cold work. In order to improve the strength/ductility combinations achieved by cold work tensile blanks at the 14% and 22% levels were stress relieved by vacuum heat treatment at selected points within a matrix bounded by times from 2 h to 16 h and temperatures from 250° to 500°C. For both levels of cold work there is no significant change in either UTS or elongation after treatment at temperatures up to 400°C. At 500°C however the anticipated recovery of ductility is observed, but with some loss of strength.

31481 (SAND—84-1876-Vol.1, pp 258-270) **Isothermal time-temperature-transformation diagram for the uranium-6 niobium alloy.** Vandermeer, R.A. (Oak Ridge Y-12 Plant, TN). Jan 1985. No Distribution. Refer request to Sandia. File Number TI85027162. (CONF-8310370—Vol.1). Contract W-7405-ENG-26.

From JOWOG 22 uranium alloy meeting; Albuquerque, NM, USA (11 Oct 1983).

A wide variety of mechanical properties can be produced in the uranium-6 niobium (U-6Nb) alloy by heat treatment. Knowledge about the nature of the aging reactions below 400°C is lacking. In this study, dilatometry was used to measure the isothermal kinetics of the aging reactions at temperatures between 203° and 585°C. At least three aging phenomena were identified. A classical cellular or discontinuous precipitation was found at temperatures between 500° and 585°C. Two superimposed aging phenomena were observed between 203° and 350°C. One was attributed to a solute-clustering phenomenon, the other to the formation of an isothermal α'' martensite. The kinetics of each of these aging processes was described by an equation of the Avrami type. Reaction constants were calculated from analysis of length change data obtained at each temperature and a time-temperature-transformation diagram was constructed.

31482 (SAND—84-1876-Vol.1, pp 271-313) **Phenomenological diffusion behavior and diffusion leveling in U-Nb alloys.** Romig, A.D. Jr. (Sandia National Labs., Albuquerque, NM). Jan 1985. No Distribution. Refer request to Sandia. File Number TI85027162. (CONF-8310370—Vol.1). Contract AC04-76DP00789.

From JOWOG 22 uranium alloy meeting; Albuquerque, NM, USA (11 Oct 1983).

Diffusion behavior in γ-phase U-Nb has been investigated in the temperature range 800 to 1000°C. Above 977°C a continuous bcc solid solution exists between U and Nb. Below this temperature a solid state miscibility gap exists between the bcc U-rich γ_1, and the bcc Nb-rich γ_2. The intrinsic diffusion coefficients (D/sub Nb/ and D/sub U/) and the chemical diffusion coefficient (~D) were investigated via a Kirkendall/Darken experiment. The activation energy (~Q) was found to vary with composition, being a maximum of ~ 600 kj/mole in γ_2 and decreasing to a minimum of ~ 125 kj/mole in γ_1, which agrees with the results of Peterson and Ogilvie. D/sub Nb/ and D/sub U/ could not be determined explicitly. These results were applied to process induced Nb segregation found in cast, wrought, and powder processed U-6 Nb alloys. The time-temperature dependence of the diffusion leveling reaction has been modeled with a finite difference algorithm. This scheme allows for the calculation of the heat treatment schedules required to level a given initial amount of segregation.

31483 (SAND—84-1876-Vol.1, pp 326-329) **Effect of temperature and texture on the Charpy impact energy of uranium.** Wood, D.H. (Lawrence Livermore National Lab., CA). Jan 1985. No Distribution. Refer request to Sandia. File Number TI85027162. (CONF-8310370—Vol.1).

From JOWOG 22 uranium alloy meeting; Albuquerque, NM, USA (11 Oct 1983).

The author unidirectionally rolled derby grade uranium from cast 2" slabs down to half-inch in thickness at two different temperatures: 630C and 250C. At the lower temperature an intermediate 630C salt bath anneal was required. During rolling the 630C came from a salt bath, and the 250C from an open furnace flushed with argon. A portion of the material rolled at 630C was double β quenched, cut into specimen blanks, and then heated in a high vacuum to 550C for 4 hours. The other, as-rolled, plates were cut into blanks and these blanks were annealed in a high vacuum for 4 hours at 500C, the furnace was then cooled to 425C and the anneal continued for 50 hours before cooling under vacuum. The blanks has been cut from the plates at various angles relative to the rolling direction, and Charpy bars machined therefrom were broken at various temperatures. With material produced by the low temperature rolling, fracture transition was found to be about 50C lower when the fracture path was in the rolling direction (0°) than when it was in the transverse direction (90°). With the 630C rolled material the results were not as simple, but it did appear that the lowest temperature transition behavior resulted when the fracture was at 45° to the rolling direction, and the highest temperature transition behavior resulted when the fracture was in the rolling direction. Thus the transition behavior, when measured in this way, contrasted as a result of the texture produced at each rolling temperature. The double β quenched plate had a larger grain size, yet showed the lowest transition temperature of all. Lacking a rolling texture, this material did not vary as a function of fracture direction.

31484 (SAND—84-1876-Vol.1, pp 330-343) **Properties and aging characteristics of UK and US produced U-6% Nb.** Moules, T.R.; Badger, G.S. Jan 1985. No Distribution. Refer request to Sandia. File Number TI85027162. (CONF-8310370—Vol.1).

From JOWOG 22 uranium alloy meeting; Albuquerque, NM, USA (11 Oct 1983).

This paper describes the program of work to compare the physical and mechanical properties developed in aging quenched samples of extruded UK and US produced U-6% Nb. A U-6% Nb billet has been prepared in the UK by the co-reduction of UF_4 and K_2NbF_7 with Mg, followed by vacuum induction melting. A small extrusion billet was machined from the cast billet and extruded along with a similar sized, vacuum arc melted billet produced in the US. Mechanical properties for the alloys are reported and compared against the usual aging parameters. These plots show the increase in strength and hardness and reduction in ductility as aging proceeds. Peak strengths and minimum ductility levels are reached at about 400 - 450°C. The UK alloy did not achieve peak tensile strength but this was probably due to its poor quality. Over aging coincides with decreases in strength and hardness and increases in ductility. The generally lower properties exhibited by the UK alloy compared with the US alloy can be directly attributed to differences in composition and quality of the castings. In general both the UK and US alloys exhibit similar aging characteristics with the banded α'' giving way to grain boundary and inclusion reaction products on increase in aging temperature. At temperatures of 550°C for the UK alloy and 500°C and 550°C for the US alloy the grain structure appears masked by the $\alpha + \gamma$ matrix phase. Over aging causes secondary recrystallization and precipitation at grain boundaries.

31485 (SAND—84-1876-Vol.1, pp 314-325) **Linear coefficients of thermal expansion of the uranium-6 niobium alloy between -50° and +150°C: effects of processing variables.** Vandermeer, R.A. (Oak Ridge Y-12 Plant, TN). Jan 1985. No Distribution. Refer request to Sandia. File Number TI85027162. (CONF-8310370—Vol.1). Contract W-7405-ENG-26.

From JOWOG 22 uranium alloy meeting; Albuquerque, NM, USA (11 Oct 1983).

The effects of metallurgical variables on the coefficients of thermal expansion (CTE) of a uranium-6 niobium (U-6Nb) alloy between -50° and +150°C have been studied using a quartz differential, double push rod dilatometer. The CTE was observed to be a complex function of temperature, and metallurgical history had a profound influence on CTE especially at 150°C where values ranged from a low of $5.56 \times 10^{-6}\,{}^{\circ}C^{-1}$ to a high of $19.50 \times 10^{-6}\,{}^{\circ}C^{-1}$. Even at room temperature the observed maximum and minimum CTE were $13.90 \times 10^{-6}\,{}^{\circ}C^{-1}$ and $9.52 \times 10^{-6}\,{}^{\circ}C^{-1}$, respectively. The metallurgical variables that were studied were: 1) cooling rate from the solution heat treatment temperature; 2) aging at 200°C; 3) machining; 4) thermal cycling between 100°C and -196°C; and 5) electropolishing. In general, the machined specimens had the lowest CTE and the severely quenched and the quenched-and-aged specimens had the highest CTE. The wide disparity of CTE values at 150°C can be attributed to the nature of the stress states imposed during processing and the fact that the alloy undergoes a partial phase transformation (reversion of the α'' martensite) between room temperature and 150°C. A theory of CTE for (U-6Nb) has been outlined but many of the parameters in the theory have never been measured.

31486 (SAND—84-1876-Vol.1, pp 375-380) **Permeation of hydrogen through nickel electroplate.** Anthony, S.R.; Finnerty, P. (Atomic Weapons Research Establishment, Aldermaston, England). Jan 1985. No Distribution. Refer request to Sandia. File Number TI85027162. (CONF-8310370—Vol.1).

From JOWOG 22 uranium alloy meeting; Albuquerque, NM, USA (11 Oct 1983).

The rate of permeation of hydrogen through 75 μm of nickel electroplate on uranium has been measured as a function of pressure at 25°C. Permeation was observed to occur readily at this temperature and a $p^{0.6-0.7}$ rate dependence was observed to apply. The possible impairment of the substrate material with time as a result of permeation processes was studied at both slow ($10^{-3}s^{-1}$) and fast ($10^{3}s^{-1}$) strain rates up to hydrogen flux level of 0.3ml cm^{-2}. Progressive embrittlement was detected with increasing flux level at the slow strain rate, but no such effect was determined at high strain rates.

31487 (SAND—84-1876-Vol.1, pp 344-374) **Overview of corrosion, corrosion protection, and stress-corrosion cracking of uranium and uranium alloys.** Koger, J.W. (Oak Ridge Y-12 Plant, TN). Jan 1985. No Distribution. Refer request to Sandia. File Number TI85027162. (CONF-8310370—Vol.1). Contract W-7405-ENG-26.

From JOWOG 22 uranium alloy meeting; Albuquerque, NM, USA (11 Oct 1983).

The types of corrosion, forms of corrosion, principal conditions causing corrosion, and the factors affecting corrosion of metals in general are presented. General corrosion, pitting, and stress-corrosion cracking of uranium-niobium alloys, uranium-titanium alloys, uranium-molybdenum alloys, and other uranium alloys are discussed. Effects of aqueous and gaseous environments are given along with possible protection methods.

31488 (SAND—84-1876-Vol.1, pp 381-385) **Corrosion of unalloyed uranium in moist nitrogen.** Anthony, S.R.; Finnerty, P. (Atomic Weapons Research Establishment, Aldermaston, England). Jan 1985. No Distribution. Refer request to Sandia. File Number TI85027162. (CONF-8310370—Vol.1).

From JOWOG 22 uranium alloy meeting; Albuquerque, NM, USA (11 Oct 1983).

The rate of oxidation of unalloyed uranium has been investigated at two humidities (20% RH and 50% RH) in nitrogen at 25, 40 and 60°C. The oxidation rate was observed to vary considerably between specimens in the early stages of oxidation, but to become more uniform once linear kinetics had been established. Experiments at 40 and 60°C showed the presence of carbon dioxide in the environment did not influence the corrosion process. A separate experiment was conducted at 25°C to determine the influence of sustained vibration (5 - 100 Hz) upon corrosion behavior. No significant effect was detected.

31489 (SAND—84-1876-Vol.1, pp 386-390) **Corrosion and stress corrosion of as quenched U-6Nb alloy.** Anthony, S.R.; Bacon, R. (Atomic Weapons Research Establishment, Aldermaston, England). Jan 1985. No Distribution. Refer request to Sandia. File Number TI85027162. (CONF-8310370—Vol.1).

From JOWOG 22 uranium alloy meeting; Albuquerque, NM, USA (11 Oct 1983).

The corrosion response of as-quenched U-6Nb alloy has been investigated in both moist air and moist nitrogen environments, and stress corrosion data obtained in moist air and NaCl. The alloy was found to be extremely oxidation resistant, exhibiting a corrosion resistance at least two orders of magnitude greater than unalloyed uranium in both environments. Stress corrosion experiments have been carried out in normal laboratory air (30-40%RH), 100%RH air and NaCl. No detectable susceptibility was observed at the lower humidities but clear evidence was obtained in both 100%RH and NaCl environments. The mechanical properties of the U-6Nb alloy were found to be unaffected by storage at 75°C in either test environments for periods of up to three months.

31490 (SAND—84-1876-Vol.1, pp 391-415) **Oxidation of uranium in low partial pressures of oxygen and water vapor at 100°C.** Weirick, L.J. (Sandia National Labs., Albuquerque, NM). Jan 1985. No Distribution. Refer request to Sandia. File Number TI85027162. (CONF-8310370—Vol.1).

From JOWOG 22 uranium alloy meeting; Albuquerque, NM, USA (11 Oct 1983).

Unalloyed uranium, D-38, was oxidized at 100°C in atmospheres containing low partial pressures of oxygen with and without water vapor and also containing low partial pressures of water vapor with and without oxygen. Results on reaction rates and reaction products are presented.

31491 (UCID—20172) **Potential corrosion and degradation mechanisms of Zircaloy cladding on spent nuclear fuel in a tuff repository.** Rothman, A.J. (Lawrence Livermore National Lab., CA (USA)). Sep 1984. Contract W-7405-ENG-48. 53p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85003996.

A literature review and analysis were made of corrosion and degradation processes applicable to Zircaloy cladding on spent nuclear fuel in a tuff repository. In particular, lifetime sought for the Zircaloy is 10,000 years. Among the potential failure mechanisms examined were: oxidation by steam, air, and water, including the effects of ions whose presence is anticipated in the water; mechanical overload; stress (creep) rupture; stress-corrosion cracking (SCC); and delayed failure due to hydride cracking. The conclusion is that failure due to oxidation is not credible, although a few experiments are suggested to confirm the effect of aqueous fluoride on the Zircaloy cladding. Mechanical overload is not a problem, and failure from stress-rupture does not appear likely based on a modified Larson-Miller analysis. Analysis shows that delayed hydride cracking is not anticipated for the bulk of spent fuel pins. However, for a minority of pins under high stress, there is some uncertainty in the analysis as a result of: (1) uncertainty about crack depths in spent fuel claddings and (2) the effect of slow cooling on the formation of radially oriented hydride precipitates. Experimental resolution is called for. Finally, insufficient information is currently available on stress-corrosion cracking. While evidence is presented that SCC failure is not likely to occur, it is difficult to demonstrate this conclusively because the process is not clearly understood and data are limited. Further experimental work on SCC susceptibility is especially needed.

31492 (UCRL—15666) Shape memory effect in uranium-niobium alloys below room temperature. Final report. Vandermeer, R.A. (Tennessee Univ., Knoxville (USA)). Mar 1985. Contract W-7405-ENG-48. 26p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012964.

The temperature dependence of the martensitic γ^0 to α^{11} phase transformation between 25°C and -198°C in water-quenched uranium-niobium alloys between 6.2 and 7.0 wt % niobium was determined using cold-stage x-ray diffraction experiments. Lowering the temperature promoted the transformation to α^{11} but complete transformation was never observed. The transformation was reversible with little or no hysteresis. Aging the alloys for two hours at 200°C stabilized the γ^0 phase and retarded the martensitic transformation. The compositions where M/sub s/ and M/sub f/ equaled room temperature were 5.80 and 7.04 wt % Nb respectively. At -196°C these values were approximately 0.25 wt % higher. Two alloys were selected as potential candidates for a uranium alloy clamp.

31493 (Y/DV—427) Experimental attempt to achieve microstructure variations through temperature/time permutations for a nonwrought powder metallurgy uranium-6 niobium alloy. Alexander-Morrison, G.M. (Oak Ridge Y-12 Plant, TN (USA)). 7 Jun 1985. Contract AC05-84OS21400. 25p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013166.

The powder metallurgical processing of uranium-6 niobium (U-6Nb) alloy has undergone 3 years of characterization at the Oak Ridge Y-12 Plant. The current structure of the powder metallurgy (P/M) alloy has been described as duplex: a mixture of two or more distinct grain sizes. An experiment was conducted to determine a gamma stabilizing heat treatment (time and temperature combination) to produce a structure consisting of one gamma grain size. Two heat treatments were found to produce an irregular ASTM 4 grain size. Additional P/M U-6Nb alloy material was hot pressed and characterized using the two new heat treatments; however, the resulting microstructures were size ASTM 8. Mechanical properties of the fine-grained P/M material were characterized. Continued evaluation of these results did not determine the cause of the grain refinement.

31494 (ZfK—527) Adsorption of metals on metal surfaces and the possibilities of its application in nuclear chemistry. Calculation of adsorption enthalpies with the program AMO. Rossbach, H.; Eichler, B. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Jun 1984. 20p. (In German). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701034.

The differential enthalpies of adsorption of gaseous metals on the surface of solid metals have been calculated with the program AMO. The enthalpies of adsorption are evaluated as a function of the desublimation enthalpy, the first solution enthalpy of the solid adsorbate into solid adsorbent, and the displacement energy required for the production of solid solutions. The calculated values of the adsorption enthalpies of 63 adsorbates on the surface of the adsorbents: Ti, Fe, Ni, Cu, Zr, Nb, Mo, Rh, Pd, Ag, Ta, W, Re, Ir, Pt, Au as well as Al, Si, Zn, Ge, Cd, Pb are listed in tables. The program enables to investigate the effect of several parameters on the partial molar adsorption enthalpy and to estimate unknown parameters from the experimental partial molar adsorption enthalpy.

31495 Real time measurement of deposition initiation and rate in laser chemical vapor deposition. Allen, S.D.; Jan, R.Y.; Mazuk, S.M.; Vernon, S.D. (Center for Laser Studies, University of Southern California, Los Angeles, California 90089-1112). *Journal of Applied Physics;* **58**: No. 1, 327-331(1 Jul 1985).

Laser chemical vapor deposition (LCVD) is a modification of conventional CVD using a laser heat source. Although the reactant systems used may be similar to conventional CVD, the film growth characteristics may differ in several ways. The changes in the optical properties of the film/substrate during deposition must be considered as the amount of laser energy absorbed determines the surface temperature and the maximum deposition rate. Also affecting the deposition rate is the diffusion of reactants to the reaction zone. Because of the small area heated in LCVD, higher surface temperatures can be accessed before diffusion and convection limit the deposition rate. For favorable reactant systems, very rapid deposition rates (greater than 100 μm/sec) and scan speeds for line deposition (greater than 10 cm/sec) can be achieved.

31496 Ultrahigh vacuum reaction chamber/transfer mechanism attached to an Auger electron spectrometer for the study of the reactions of clean lithium surfaces. Nebesny, K.W.; Armstrong, N.R. (Department of Chemistry, University of Arizona, Tucson, Arizona 84721). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 4, 1763-1767(Jul 1985).

An ultrahigh vacuum reaction chamber/transfer system is described which is used for the production of clean lithium and other soft group I metals. The system is used to study the reactions of clean lithium surfaces with small molecules of interest in electrochemical applications. Auger electron spectroscopy, in a spectrometer coupled to this chamber, shows that the product of the reaction of SO_2 with the clean Li surface is a combination of Li_2S and Li_2O in a 1 : 2 ratio. The transfer system/reaction chamber also allows for the study of the rates of reaction of small molecules with the clean surface. Mechanical scraping of the metal transforms the passive surface into the active, clean state. Study of the SO_2/Li reactions at a variety of temperatures (made possible by the special temperature control in the reaction chamber) shows a low activation energy for the dissociation reaction (2—5 kcal/mol).

31497 Phonon dispersion curves of nonstoichiometric Nb_3Ge. Smith, H.G.; Wakabayashi, N.; Chang, Y.K.; Pintschovius, L.; Weber, W. (Solid State Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Physical Review [Section] B: Condensed Matter;* **31**: No. 12, 7772-7778(15 Jun 1985).

The phonon dispersion curves of nonstoichiometric Nb_3Ge (T/sub c/ = 6 K) have been investigated by inelastic neutron scattering. Despite the small size of the sample (0.1 cm^3) most of the branches along the main symmetry directions, including the highest-energy modes, have been determined. No drastic anomalies were observed and temperature effects were found to be small. The results can be well described by a Born—von Karman model with axially symmetric forces up to the seventh-nearest neighbors. In a search for electron-phonon coupling effects our results for Nb_3(Ge/sub 0.8/Nb/sub 0.2/) are compared to previous results obtained on the low-T/sub c/ compound Nb/sub c/Sb (T/sub c/≃0.2 K). The major differences between the lattice dynamics of the two compounds were found to be (i) a reduction of the Nb-Ge interaction by 35% compared to the Nb-Sb interaction and (ii) the low frequency of modes in Nb_3(Ge/sub 0.8/Nb/sub 0.2/) which involve a "buckling" of the Nb chains.

31498 Magnetic and Moessbauer studies on rare-earth-containing Heusler alloys Pd_2RSn (R = Tb—Yb). Malik, S.K.; Umarji, A.M.; Shenoy, G.K. (Materials Science and Technology Division, Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review [Section] B: Condensed Matter;* **31**: No. 11, 6971-6975(1 Jun 1985).

Magnetic susceptibility and ^{119}Sn Moessbauer studies have been carried out on a new series of rare-earth-containing Heusler alloys having the formula Pd_2RSn (R = Tb—Yb). The Tm and Yb compounds in this series along with Lu, Sc, and Y compounds are superconducting. The magnetic susceptibility of Pd_2TmSn and Pd_2YbSn deviates from the Curie-Weiss behavior at low temperatures indicating that crystalline electric field effects are appreciable. Analysis of the magnetic susceptibility data in terms of crystalline electric fields shows that the ground state of the Tm^{3+} ion is nonmagnetic which, therefore, does not affect the superconducting state. The susceptibility of Yb^{3+} ions at low temperatures is also reduced from the free-ion value due to the crystalline electric field interaction. The Tb- and Dy-containing compounds order antiferromagnetically with Neel temperatures of 9 and 15 K, respectively, while Er- and Ho-containing compounds are paramagnetic down to 1.4 K. The hyperfine field at the Sn site in Pd_2TbSn is about 50 kOe but is only about 10 kOe in Pd_2DySn at 4.2 K.

31499 Localization effects on superconductivity in homogeneous metallic glasses. Poon, S.J. (Ames LaboratoryU.S. Department of Energy, Iowa State University, Ames, Iowa 50011). *Physical Review [Section] B: Condensed Matter;* **31**: No. 11, 7442-7445(1 Jun 1985).

It is pointed out that localization effects on bulk superconductivity do exist and can be significant in homogeneous amorphous alloys (or typical metallic glasses) whose upper critical fields appear to follow the standard Werthamer-Helfand-Hohenberg-Maki (WHHM) curves. Owing to the similarity in the temperature dependence of critical fields predicted by the Fukuyama-Ebisawa-Maekawa theory of the weakly localized regime and the WHHM results over a very wide temperature range, these effects have escaped notice heretofore. Comparison of the electronic density of states obtained from specific-heat measurement (absence of field-induced delocalization effects) and the "apparent" one derived from fitting critical-field data reveals the aforementioned effects.

31500 (UCRL-Trans—12061) Nonlinear propagation of elastoplastic waves in Ke penetrators. (Excerpts). Kuscher, G.F. (Lawrence Livermore National Lab., CA (USA); Ernst Mach Inst., Freiburg (Germany, F.R.)). May 1985. Contract W-7405-ENG-48. Translated from Report 2/85. 143p. NTIS, PC A07/MF A01; 1; GPO Dep. File Number DE85011450.

The characteristic principles of the approximation models are discussed briefly. As a result of the present study, it has been possible for the first time to obtain experimental confirmation of the basic hypotheses of the theory of elastic as well as elastoplastic wave propagation and to obtain dynamic material data corresponding to the theoretical definitions. The one-dimensional elastic and elastoplastic theory of wave propagation is discussed in detail. In general, all authors assume a one-dimensional treatment of wave propagation as the basis for an experimental study of elastoplastic properties of materials in bars. Within the present study, no experimental findings were obtained, such as boundary influences or dispersion of the elastic wave, which would not justify this type of analysis.

31501 Influence of adsorbed Bi on the chemisorption properties of Pt(111):H_2, CO, and O_2. Paffett, M.T.; Campbell, C.T.; Taylor, T.N. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 812-816(May 1985).

The growth modes and interactions of vapor-deposited Bi on a clean Pt(111) surface and its effects on the chemisorption of H_2, CO, and O_2 have been monitored by Auger electron spectroscopy (AES), low-energy electron diffraction (LEED), and thermal desorption mass spectroscopy (TDMS). For submonolayer Bi coverages, LEED patterns were observed to progress with increasing coverage through p(2 x 2), (7/8 x 7/8)R30°, p(3 x 3), and p(4 x 4) structures. The Bi TDMS and AES data are consistent with proposed structural models giving absolute coverages of 0.25, 0.33, 0.44, and 0.56, respectively. For submonolayer coverages of this s^2p/sup n/-type metal, Bi adatoms are strongly repulsive and maximize their spacing subject to the constraints of the Pt(111) sites. This is to be contrasted with d/sup n/s/sup m/-type metals such as Ag, Cu, and Au on Pt(111), which show attractive interactions and coalesce into 2d islands. In chemisorption of small molecules on Pt(111), each Bi adatom blocks about two Pt surface atoms. An ensemble of two adjacent Pt sites is required for both dissociative H_2 and molecular O_2 adsorption versus one site for CO adsorption; therefore, uptake of the former adsorbates is much more severely attenuated as θ/sub Bi/ increases.

31502 Oxidation of $Ni_{60}Fe_{40}$(100) in the presence of sulfur. Lad, R.J.; Schrott, A.G.; Blakely, J.M. (Materials Science and Engineering, Cornell University, Ithaca, New York 14853). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1282-1286(May 1985). Contract AC02-79ER10501.

The effect of adsorbed sulfur on the initial oxidation of a $Ni_{60}Fe_{40}$(100) alloy surface has been studied at 100 and 500 °C using low energy electron diffraction (LEED) and Auger electron spectroscopy (AES). Measurements of the oxygen uptake rate have been made as a function of sulfur coverage at each temperature. Within the O_2 exposure range studied, the uptake of O_2 is observed to be inhibited by an ordered c(2 x 2) sulfur phase at 0.5 monolayers coverage, independent of temperature. For sulfur coverages below 0.5 monolayers, an Fe-rich surface oxide forms with a composition and morphology dependent on the sample temperature. The experimental observations suggest that at 500 °C, sulfur-free oxide islands grow interspersed between c(2 x 2)S domains whereas at 100 °C, the adsorbed sulfur layer becomes overgrown by coalesced oxide. The mechanisms of oxide nucleation and growth are related to the existence of different phases of the chemisorbed sulfur + oxygen layer as previously studied.

31503 Field adsorption of inert gas atoms on the tungsten surface: A pulsed-laser atom-probe study. Kinkus, T.J.; Tsong, T.T. (Physics Department, Pennsylvania State University, University Park, Pennsylvania 16802). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1521-1524(May 1985).

On a solid surface, inert gas atoms can be field adsorbed to the surface under the influence of a strong electric field. The probability of field adsorption was measured as a function of temperature for He, Ne, and Ar on the W(112) surface. Although it was assumed that gas atoms field adsorb only on top of surface atoms, experimental evidence indicates that secondary sites also exist, such as on bridge sites, between surface atoms, or second layer adsorption sites. A simplified calculation of the binding energy assumes an isolated dipole pair model and significantly overestimates the binding energy at 0.20, 0.19, and 0.24 eV for He, Ne, and Ar at a field of 4.5, 3.9, and 2.5 V/A, respectively. The measured values were 0.17, 0.14, and 0.12 eV. Including a correction for the depolarizing field caused by the layer of polarized adatoms gives a reasonable agreement with the experimental values at 0.18, 0.16, and 0.13 eV.

31504 Ellipsometric investigation of Be(0001) oxidation. Christensen, T.M.; Blakely, J.M. (Materials Science and Engineering, Cornell University, Ithaca, New York 14853). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1607-1612(May 1985). Contract AC02-79ER10501.

Studies by ellipsometry of the early stages of oxidation of the Be(0001) surface in the temperature range 30—600 °C have been made in conjunction with Auger electron spectroscopy (AES) and low energy electron diffraction (LEED). An initial decrease in the ellipsometric parameter Psi is taken to indicate incorporation of oxygen into the beryllium surface. The magnitude of the decrease in Psi depends on temperature and is greatest around 100 °C. It is proposed that at the minimum in Psi the surface consists of islands of BeO in an electron depleted Be layer; an effective medium approximation, assuming nearly free electron behavior for Be, can describe the experimental results with reasonable values of the parameters. After oxide coalescence, p(2 x 2)-BeO and ((3)/sup 1/2/x(3)/sup 1/2/)R30° -BeO LEED patterns are observed. They are unstable under an electron beam, but can be regenerated by short anneals at 500 °C. The ellipsometric parameter Δ is observed to be significantly different for the surface with and without this ordered structure. This change in Δ is not directly related to changes in the degree of order, but may be caused by electron beam enhanced decomposition of adsorbed gas. Ellipsometry results for oxygen on Ni(111) have also been obtained; these assist in the interpretation of the Be data.

31505 Initial oxidation of Zn(0001) surfaces: H_2 adsorption and XPS studies. Chan, L.; Griffin, G.L. (Department of Chemical Engineering and Materials Science, University of Minnesota, Minneapolis, Minnesota 55455). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1613-1617(May 1985). Contract AC02-79ER10450.

H_2 adsorption capacity measurements have been combined with XPS intensity measurements to study the kinetics of O_2 uptake on Zn(0001) surfaces. On clean Zn(0001) the temperature programmed desorption spectrum of H_2 shows half-order desorption kinetics and an apparent desorption energy of 11 kcal/mole. As the surface is oxidized by progressive dosing with O_2, two features are noted: The H_2 desorption spectrum characteristic of clean Zn(0001) is attenuated in a nonlinear fashion and a new H_2 desorption state with an activation energy of 18 kcal/mole is observed for surfaces with less than saturation oxygen coverage. XPS results indicate that H_2 adsorption is not completely blocked until an oxygen coverage corresponding to approximately 3 monolayers is achieved. Both H_2 uptake and XPS intensity measurements also indicate that the oxygen sticking coefficient increases with oxygen coverage up to about one half of the O_2 saturation coverage. These results indicate that the initial oxidation of Zn surfaces involves the formation and growth of multilayer oxide islands, where oxygen incorporation at the perimeter of the islands is the rate limiting step.

31506 Creation of tailored surfaces using selective oxidation of ion-implanted materials. Brown, D.W.; Musket, R.G.; Weirick, L.J. (Department of Applied Science, University of California Davis/Livermore and Lawrence Livermore National Laboratory, Livermore, California 94550). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 583-587(May 1985). Contract W-7405-ENG-48.

Ion implantation can produce a subsurface layer composition very different from that of the bulk material. The present work involves postimplant selective-oxidation treatments to produce a tailored surface composition. Formation of Al_2O_3-rich layers on both pure iron and 304-L stainless steel was achieved by implanting aluminum and subsequently heating the implanted sample in a controlled oxidizing environment to allow the subsurface aluminum to diffuse to the surface and oxidize. The thickness and composition of the resulting oxide layer was found to be strongly dependent on (a) the oxide layer existing prior to the selective oxidation, (b) the parameters of the treatment (i.e., composition and pressure of the furnace gases and time), and (c) the dose of aluminum implanted. Compositional analyses via ion backscattering and Auger electron sputter profiling were performed to study the processes and mechanisms.

31507 Pulsed x-ray induced damage to metal and multilayer mirrors. Kohler, D.; Guttman, J.L.; Watson, B.A.; Gerassimenko, M. (Applied Physics Laboratory, Lockheed Palo Alto Research Laboratory, Palo Alto, California 94304). *Review of Scientific Instruments;* **56**: No. 5, 812-814(May 1985).

The effects of intense pulses of laser-produced x rays upon the reflective and diffractive properties of metal mirrors and layered synthetic microstructure mirrors (artificial crystals) have been investigated. Laser pulses from a Nd—glass pulsed laser system of 25-ns pulse width and 50-J energy were focused onto a copper target to generate x-ray pulses. A polished planar nickel mirror reflected 0.98- to 1.3-keV x rays onto photographic film. The x-ray flux onto the mirror (at grazing incidence angles near 3.5°) was split into two adjacent fields with a beryllium filter over one field and with an equal thickness beryllium filter placed over the film holder covering the adjacent field. Thin pieces of Kimfol were used as debris shields ahead of the mirror sample. This technique provided an in situ normalization since both a low- and high-intensity irradiation can be simultaneously achieved on adjacent portions of the mirror. A similar technique was used to study reflection by a multilayer mirror of carbon—tungsten carbide layering with a 2d spacing of 3.92 nm. Experimental details and the results obtained are presented.

31508 (RFP-Trans—438) Refractory material which is resistant to oxidation and hot corrosion at temperatures of 1000-1600°C. Schlichting, J. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant; Bundesministerium der Verteidigung, Bonn (Germany, F.R.)). May 1985. Contract AC04-76DP03533. Translation of BMVg-FBWT-79-32. 50p. NTIS (US Sales Only), PC A03. File Number DE85011580.

The report summarized results on development and applicability of a refractory metallic material which is resistant against oxidation in air and against hot corrosion in burnergas with additions of NaCl, V_2O_5 and H_2S up to temperatures between 1000 and 1500°C. This material consists of niobium, tantalum or their alloys, coated with a sintered 200 to 300 μ protective layer of $MoSi_2$. It is also shown by test results that this material can be considered for application as turbine blades. In preliminary test with centrifugal acceleration of 100,000 g at 1200°C no measurable damage of this material has been observed.

31509 Suppression of spin fluctuations by alloying in UPt_3. Stewart, G.R.; Giorgi, A.L. (Materials Science and Technology Division, Los Alamos National Laboratory, Los Alamos, New Mexico). *Journal of Low Temperature Physics;* **59**: No. 1, 185-189(1 Apr 1985).

In order to investigate the normal state spin fluctuation behavior of UPt_3, we have measured the low temperature resistivity and specific heat C of U(Pt/sub 0.8/Pd/sub 0.2/)$_3$, which we find to be close to the phase stability boundary for the hexagonal UPt_3 structure. The evidence for spin fluctuations observed in UPt_3,aT^3 ln (T/T/sub SF/) upturn in C/T below 10 K, is totally suppressed in U(Pt/sub 0.8/Pd/sub 0.2/)$_3$, and the γ value, proportional to the dressed density of states, is decreased by 50% compared to pure UPt_3. This extreme sensitivity to substitution by isoelectronic Pd for Pt indicates that the spin fluctuations in UPt_3 depend critically on the hybridization of the U electrons, U-U separation equal to 4.2 A, with the electrons of the intervening atoms.

31510 Comparison between Ti anomalous x-ray scattering factors obtained from layered synthetic microstructures and the dispersion relationship. Warburton, W.K.; Ludwig K.F. Jr.; Barbee T.W. Jr. (Stanford Synchrotron Radiation Laboratory, Stanford University, Stanford, California 94305). *Journal of the Optical Society of America B: Optical Physics;* **2**: No. 4, 565-567(Apr 1985).

We compare Ti anomalous x-ray scattering factors f' obtained close to the Ti K absorption edge by two techniques: analysis of changes in Bragg peak reflectivity and resolution for scattering from a Ti/C layered synthetic microstructure (LSM) and integration through the Kramers—Kronig dispersion relationship of absorption data on pure Ti. The agreement is good for initial results and suggests that the LSM technique should be developed further as a technique for obtaining medium-accuracy x-ray optical constants across large energy ranges.

31511 Heavy-fermion uranium systems. Fisk, Z.; Ott, H.R.; Smith, J.L. (Los Alamos National Lab., NM (USA)). *Journal of Magnetism and Magnetic Materials;* **47/48**: 12-16(Feb 1985).

We review the experimental results on heavy-fermion uranium based superconductors and magnets.

31512 Electrical resistivity of $ThRu_2$. Lawson, A.C. (Pomona Coll., Claremont, CA (USA). Dept. of Physics and Astronomy; Los Alamos National Lab., NM (USA). Materials Science and Technology Div.). *Physics Letters [Section] A;* **107**: No. 1, 45-47(7 Jan 1985).

A simple procedure is given for fitting experimental electrical resistivity data to the parallel resistor model. The procedure is applied to the C-15 compound $ThRu_2$.

31513 Electron beam and pulsed laser irradiation of glass-forming Cr-Ta and Cr-Zr-Ge alloys. Alden, D.A.; Massalski, T.B.; Lowndes, D.H. (Carnegie-Mellon Univ., Pittsburgh, PA). *Scripta Metallurgica;* **19**: 67-72(Jan 1985).

Preliminary results are reported on the application of (1) an electron beam, (2) a pulsed laser whose pulse duration is of the order of about 0.5 msec, and (3) a pulsed laser of about 35 nsec pulse duration, to the surface of one binary Cr-Ta and three ternary Cr-Zr-Ge alloys. In order to enhance the possibility of producing a metallic glass through these irradiations, each of the alloys was prepared in a eutectic or near-eutectic region of the respective phase diagram. Irradiation produced homogenization and grain refinement in the Cr-Ta alloy surface, but no amorphous phase was detected. The ternary alloys, however, produced both metallic glass and a fine-grained FCC structure. 6 references.

31514 **Pulsed electron beam annealing of A15 tape superconductors.** Braginski, A.I.; Greggi, J.; Janocko, M.A. (Westinghouse Research and Development Center, Pittsburgh, PA (USA)); Kleiser, T.; Meyer, O. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Festkoerperphysik). *Nuclear Instruments and Methods in Physics Research, Section B: Beam Interactions with Materials and Atoms;* **233**: No. 3, 525-533(Dec 1984).

Thick films of Nb_3Ge and Nb_3Sn on niobium and Hastelloy B tape substrates were e-beam annealed using single 300 ns pulses and deposited energy densities, Esub(p), between 0.5 and 5 J/cm^2. In most cases the energy density thresholds causing melting, Esub(pt), agreed reasonably with numerical simulation data. The melted and resolidified layers were microcrystalline A15's when Esub(p)/Esub(pt)>1.1, and coarse-crystalline A15 at Esub(p)/Esub(pt)>=1.4. Melting and resolidification resulted in film crazing/cracking due to the differential thermal contraction. The extent of film damage depended upon the film-substrate mismatch. The critical current density, jsub(c), was accordingly reduced. In the absence of crazing/cracking at Esub(p)/Esub(pt)>=1 an indication of jsub(c) increase in Nb_3Sn was obtained. This increase was attributed to the formation of additional flux pinning centers such as grain boundaries and/or second-phase precipitates.

31515 **Revision of the uranium-iron phase diagram.** Chapman, L.R.; Holcombe, C.E. Jr. (Union Carbide Corp., Oak Ridge, TN (USA). Nuclear Div.). *Journal of Nuclear Materials;* **126**: No. 3, 323-326(Nov 1984).

31516 **Surface tension of sodium.** Goldman, J.H. (Argonne National Lab., IL (USA). Chemical Technology Div.). *Journal of Nuclear Materials;* **126**: No. 1, 86-88(Sep 1984).

31517 **Effect of extrusion texture on the linear thermal contraction and mechanical properties of the uranium-2.4 wt% niobium alloy.** Kollie, T.G.; Anderson, R.C.; Carpenter, D.A.; Smith, D.D. (Oak Ridge Y-12 Plant, TN (USA)). *Journal of Nuclear Materials;* **125**: No. 2, 160-169(Jul 1984).

The effects of forward extrusion in the α-phase on the linear thermal contraction (LTC) and tensile mechanical properties of the uranium-2.4 wt% niobium (U-2.4Nb) alloy were studied. Extrusion parameters investigated included: extrusion ratio, extrusion ram speed, extrusion die angle, and billet preheat temperature. The investigation revealed that the anisotropic LTC developed in the alloy could be correlated with the preferential alignment of the crystallographic axes of the alloy caused by extrusion. The LTC and tensile strengths decreased with an increase in the extrusion ratio. The effects of the other extrusion parameters on the properties were small.

31518 **Ion beam mixing of metal films on SiO_2.** White, C.W.; Farlow, G.; Narayan, J. (Oak Ridge National Lab., TN (USA)); Clark, G.J.; Baglin, J.E.E. (IBM Research Laboratories, Yorktown Heights, NY (USA)). *Materials Letters;* **2**: No. 5, 367-372(Jun 1984).

Ion beam mixing of certain metals deposited on SiO_2 substrates causes reactions to occur which result in the formation of metal-rich silicides in the region of the interface and an increase in the adhesion of the film to the substrate. For other metals, ion irradiation causes lateral transport and coalescence of metal atoms resulting in the formation of an island structure. The results obtained by ion irradiation are compared with previous studies of high-temperature thermal processing of metal films on SiO_2.

31519 **Local atomic order of a Ni-12.7 at.% Al alloy quenched from 1323 K.** Epperson, J.E.; Fuernrohr, P. (Max-Planck-Institut fuer Metallforschung, Stuttgart, West Germany). *Acta Crystallographica, Section A: Foundations of Crystallography;* **A39**: 740-746(1983).

High-angle x-ray diffuse scattering was measured in a volume element in reciprocal space for a Ni-12.7 at.% Al alloy single crystal quenched from 1323 K. The Cowley-Warren order parameters were determined after separation of the first- and second-order size effects, using a procedure based on the Borie-Sparks quadratic approximation of atomic displacements. The experimental order coefficients were used to reconstruct the real-space locally ordered distribution of atoms, from which the spectrum of nearest-neighbor atomic configurations was determined. Some 61% of the Al atoms were found to be in a planar-ordered configuration consisting of a nickel atom and four nearest-neighbor aluminum atoms, the basic structural unit of Ni_3Al. These planar elementary ordered units were, of course, distributed on the three equivalent {100} planes. While most of the ordered domains consisted of from one to three Ni_3Al rings, a few domains were found to contain on the order of 100 such elementary ordered units. The larger ordered domains may be thought of as embryos of the ordered Ni_3Al phase that formed during quenching of the bulk-alloy single crystal. There is evidence that the spatial distribution of ordered domains is not random. 24 references, 3 figures, 4 tables.

31520 **Ordered steps on Bi(~ 0001) vicinal surfaces by laser pulse anneal.** Ellis, W.P.; Thompson, K.A.; Nogar, N.S. (Los Alamos National Lab., NM). *Surface Science;* **130**: 317-323(1983).

LEED patterns characteristic of an ordered array of equally spaced steps of minimum height resulted from pulsing disordered Bi(~ 0001) vicinal surfaces. Ten XeCl eximer laser pulses at λ = 308 nm, of 10 ns duration and 4 mJ/cm^2 each and at 0.5 s intervals optimized ordering on the Bi(10116) surface, but additional exposure degraded the surface crystallinity as did a twentyfold increase in power density.

31521 **AES studies of palladium films formed on copper and mica.** De Cooman, B.C.; Vankar, V.D.; Vook, R.W. (Syracuse Univ., NY). *Surface Science;* **128**: 128-144(1983). Contract AC02-77ER04496.

Thin epitaxial films of palladium were grown on epitaxial copper films and cleaved mica in ultra high vacuum. The growth modes of these films were investigated by Auger electron spectroscopy (AES), low energy electron diffraction (LEED), transmission electron microscopy (TEM), and TEM replica techniques. Layer by layer growth of Pd on Cu and mica was observed and inelastic mean free paths of Auger electrons for energies of 60 eV (Cu MMM) and 329 eV (Pd MNN) were calculated. These values were 5.7 and 6.9 A respectively. The thermal stability of monocrystalline and polycrystalline Pd/Cu bilayer films at 483 K was also investigated by AES and TEM. It was found that Pd agglomerates on the Cu at this temperature to form a Stranski-Krastanov growth morphology. The agglomeration is much more rapid on polycrystalline films, suggesting that high surface diffusivity paths (grain boundaries and possibly other defects) enhance the surface diffusion of Pd on Cu. 14 references, 14 figures.

31522 **Pb/sub 0.77/K/sub 0.23/[Pt(CN)$_4$].1.5H$_2$O: a new type of partially oxidized tetracyanoplatinate salt.** Coles, G.S.V.; Underhill, A.E.; Williams, J.M.; Schultz, A.J. (University Coll. of North Wales, Bangor). *Journal of the Chemical Society, Dalton Transactions: Inorganic Chemistry;* 2529-2530(1983).

The preparation and properties of a new type of partially oxidized tetracyanoplatinate salt, Pb/sub 0.77/K/sub 0.23/[Pt(CN)$_4$].1.5H$_2$O, are reported. The electrical conduction properties are compared with those of previously known one-dimensional metallic complexes of platinum. 7 references, 2 figures.

31523 (AD-A—150167/5/XAB) Electrical and thermal transport property studies of high-temperature thermoelectric materials. Interim report, 15 August 1983-15 May 1984. Bates, J.L.; Garnier, J.E.; Olsen, L.C.; Griffin, C.W. (Pacific Northwest Labs., Richland, WA (USA)). Jul 1984. 105p. NTIS, PC A06/MF A01.

The first year of this research emphasized the study of electronically conducting oxides with varied transport characteristics, an evaluation of theoretical models, and the determination of a high-temperature transport property data base. Oxide systems based on SnO_2-In_2O_3, (La, Y) (Mg,Ca,Sr) CrO_3, HfO_2-RxOy-In_2O_3 and La(Sr)MnO_3 were selected for initial studies and represent different crystallographic/defect structures and transport characteristics. The electrical conductivity, Seebeck coefficient and thermal conductivity for these oxides are being measured and have provided a preliminary data base for evaluating transport properties and the figure of merit. This report describes the technical results obtained during the first year's study of high-temperature thermoelectric materials. The scope of the research is (a) to develop theoretical models for electrical, thermal, and thermoelectric behavior of refactory oxide materials, (b) to determine electrical transport properties necessary to develop and test these models, (c) to determine methods for increasing the figure of merit in refractory oxide systems by varying compositon, defect structure. microstructure, etc., and (d) to use these models to establish theoretical and empirical limits of the figure of merit for these oxides and other refractory materials.

31524 (AD-A—151413/2/XAB) Transformation-toughened ceramics. A potential material for light diesel engine applications. Final report, 1 October 1982-30 September 1983. Tien, T.Y. (Michigan Univ., Ann Arbor (USA). Dept. of Materials and Metallurgical Engineering). Jun 1984. 54p. NTIS, PC A04/MF A01.

This report contains three parts: thermal-conductivity studies in the system Al_2O_3- Cr_2O_3-ZrO_2-HfO_2 are presented in the first part; mechanical behavior of these compositions is presented in the second part; and the mullite - ZrO_2 system are discussed in the third part. The results indicate that a composition containing 15 mole % of Cr_2O_3 in Al_2O_3 in the matrix phase has a thermal conductivity comparable to that of stabilized zirconia.

31525 (CONF-8505138—2) Magnitude and range of the RKKY interaction in $SmRhB_4$. Terris, B.D.; Gray, K.E.; Dunlap, B.D. (Argonne National Lab., IL (USA)). Apr 1985. Contract W-31-109-ENG-38. 10p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012284.

From Materials and mechanisms of superconductivity conference; Ames, IA, USA (29 May 1985).

The superconductive and magnetic transition temperatures taken together are shown to provide a unique probe which separately determines both the magnitude and range of the RKKY interaction in the $RERh_4B_4$ magnetic-superconductors (RE = Er, Sm). Experimentally, an unexpected peak is found in the antiferromagnetic ordering temperature of $SmRh_4B_4$ vs. electron mean free path, while for $ErRh_4B_4$ the ferromagnetic ordering temperature decreases monotonically. These qualitative features, as well as the quantitative differences between $SmRh_4B_4$ and $ErRh_4B_4$, are in excellent agreement with calculations using a mean free path dependent RKKY interaction.

31526 (CONF-8505138—3) Formation, ion modification, and annealing of VN. Thompson, J.R.; Ellis, J.T.; Christen, D.K.; Lewis, J.D.; Sekula, S.T. (Oak Ridge National Lab., TN (USA); Tennessee Univ., Knoxville (USA). Dept. of Physics). Apr 1985. Contract AC05-84OR21400. 18p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012896.

From Materials and mechanisms of superconductivity conference; Ames, IA, USA (29 May 1985).

Thin films of vanadium nitride, formed by diffusion of N_2 gas into previously characterized vanadium films, have been modified using ion beam techniques. Irradiation by N-ions produced decreases in the superconductive transition temperature T/sub c/ and electrical resistance ratio RRR, which saturated at 3.6 K and 1.0, respectively. It was found that films with higher T/sub c/ values were less susceptible to ion-damage. An isochronal annealing study revealed several annealing stages and nearly complete recovery of T/sub c/. Laser annealing of this brittle material was rather ineffective, however. The results of this work are related to the possible formation of high T/sub c/, B1 phase MoN. 16 refs., 3 figs.

31527 (DOE/ER/45016—1) Electron optical and microanalytical studies of precipitation in ceramic systems. Progress report, July 1, 1983-June 30, 1984. Notis, M.R. (Lehigh Univ., Bethlehem, PA (USA)). May 1985. Contract AC02-83ER45016. 16p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012541.

Research work has been performed in four major areas: Laser Raman Spectroscopy and x-ray diffraction studies of pure and impurity stabilized zirconia powders, Laser Raman Spectroscopy and x-ray diffraction studies of pure yttria and lanthana doped yttria powders, preparation of tetragonal impurity doped ternary MgO-TiO-ZrO_2 powders by coprecipitation gel techniques, and transmission electron microscope study of defect (twin) structure in CaZrOp. NTIS, PC A05/MF A01; GPO Dep. File Number DE85012391.

Thesis.

Chlorination of $CaSi_2$ produces a chlorosilane mixture containing Si_2Cl_6 and Si_3Cl_8. These compounds may be separated by simple distillation. A reflux reactor system was developed in this work which has several advantages over the liquid ammonia process. The liquid ammonia layer in the Ube process is advocated as a means of removing NH_4Cl from the reaction product. However, material made in the reflux reactor, and subsequently washed with liquid ammonia, has the same chlorine content (100 ppM) after pyrolysis as the powder produced by Ube. There are potential advantages in using Si_2Cl_6 and Si_3Cl_8. The measured ceramic yields of $Si_2(NH)_3$ (88%) and $Si_3(NH)_4$ (94.6%) are higher than that of $Si(NH)_2$ (83%). Although none of the silicon imide compacts densified during pyrolysis at the relatively low temperatures (1200 to 1450°C) which were used, the particles produced are sufficiently small (0.3 μm) that they might sinter at higher temperatures. Carbon may be incorporated into the silicon imide structure by copolymerizing a chlorosilane and a small amount of chloroalkane with ammonia. When such a powder was pyrolyzed, the resulting product was α - Si_3N_4 with no detectable SiC. The carbon in the powder was effective in reducing the oxygen content of the silicon nitride.

From Symposium on plasma chemistry; Eindhoven, Netherlands (1 Jul 1985).

Ultrafine powders of SiC, Si_3N_4, Ni, and Al_2O_3 have been prepared in a rf-plasma reactor, utilizing an induction plasma tube designed at Los Alamos. The primary particle size of the ceramic powders ranges from 5 to 50 nm. Silicon carbide and alumina are ultrapure crystalline powders, while silicon nitride is amorphous for surface areas greater than 100 m^2/g. Plasma nickel powder will sinter to full density at 1073 K.

From Advances in materials characterization II conference; Alfred, NY, USA (29 Jul 1984).

High resolution electron microscopy (HREM) is useful in bringing out the microstructural variations, such as structural details at grain boundaries, at very high resolutions, even at atomic levels. An important aspect is the examination of the surface irregularities at the boundary regions which provide information on the transformation characteristics of the phases. In this paper, we present data on the microstructural characteristics of some high temperature ceramics (silicon nitride, mullite, and aluminum nitride) with particular emphasis on the detection of grain boundary amorphous phases. Furthermore, the HREM technique is reevaluated with reference to other techniques.

From American Ceramic Society annual meeting; Cincinnati, OH, USA (5 May 1985).

The effects of bond and thermal barrier coating compositions, thicknesses, and densities on air plasma spray deposited Ni-Cr-Al-Y/ZrO2-Y2O3 life were evaluated in cyclic furnace oxidation tests at temperatures from 1110 to 1220 C. An empirical relation was developed to give life as a function of the above parameters. The thermal barrier system tested which had the longest life consisted of Ni-35.0 wt% Cr-5.9 wt% Al-0.95 wt% Y bond coating and ZrO2-6.1 wt% Y2O3 thermal barrier coating.

31536 **(NRCN(LS)—015) Silicon nitride-fabrication, forming and properties. Literature survey.** Yehezkel, O. (Israel Atomic Energy Commission, Beersheba. Nuclear Research Center-Negev). Jan 1983. 65p. (In Hebrew). NTIS (US Sales Only), PC A04/MF A01. File Number DE85701458.

This article, which is a literature survey of the recent years, includes description of several methods for the formation of silicone nitride, and five methods of forming: Reaction-bonded silicon nitride, sintering, hot pressing, hot isostatic pressing and chemical vapour deposition. Herein are also included data about mechanical and physical properties of silicon nitride and the relationship between the forming method and the properties.

31537 **(PUC-TN—13/83) Study on the influence of annealing effects in GaN VPE.** Furtado, M.; Jacob, G. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Jun 1983. 33p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701430.

The effects of annealing that occur during VPE growth of GaN were investigated. GaN powder (and epilayers) samples were annealed in Ar, N_2, H_2, NH_3, HC1 + N_2 and HC1 + H_2(N_2, H_2 and HC1 + N_2), respectively; under a range of experimental conditions of interest for preparing electroluminescent devices. Good surface appearence Zn doped epilayers were also used under N_2 in order to investigate surface morphology changes due to thermal decomposition. It was found that GaN reacts with H_2, remains stable under NH_3, and the effects of thermal decomposition are somewhat enhanced with HC1. The epilayers' behaviour under thermal decomposition and HC1 are interpreted by the greater stability of the (0001) crystal plane, which accounts for the improvement of the surface quality under special growth conditions. Significant observations are reported concerning GaN decomposition in different ambients.

31538 **Electroluminescence in ZnO varistors: Evidence for hole contributions to the breakdown mechanism.** Pike, G.E.; Kurtz, S.R.; Gourley, P.L.; Philipp, H.R.; Levinson, L.M. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Journal of Applied Physics;* **57**: No. 12, 5512-5518(15 Jun 1985).

The previously postulated production of holes during the electrical breakdown of varistors has been directly verified. In some compositions band-gap (3.2 eV) luminescence from the recombination of these holes with free electrons has been observed. The intensity of this luminescence is greater in varistor compositions exhibiting higher nonlinearity coefficients. It is also proportional to the square of the current which implies hole creation by impact ionization in the depletion region near the grain boundaries. This study used varistors of relatively simple chemical composition.

31539 **Investigation of the magnitude and range of the Ruderman-Kittel interaction in $SmRh_4B_4$ and $ErRh_4B_4$.** Terris, B.D.; Gray, K.E.; Dunlap, B.D. (Materials Science and Technology Division, Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review Letters;* **54**: No. 19, 2143-2146(13 May 1985).

The superconductive and magnetic transitioin temperatures taken together are shown to provide a unique probe which separately determines both the magnitude and range of the Ruderman-Kittel interaction in the RRh_4B_4 magnetic superconductors (R = Er, Sm). Experimentally, an unexpected peak is found in the antiferromagnetic-ordering temperature of $SmRn_4B_4$ versus electron mean free path, while for $ErRh_4B_4$ the ferromagnetic-ordering temperature decreases monotonically. These qualitative features, as well as the quantitative differences between $SmRh_4B_4$ and $ErRh_4B_4$, are in excellent agreement with calculations using a mean-free-path—dependent Ruderman-Kittel interaction.

31540 **Self-irradiation effects in ^{238}Pu-substituted zirconolite. Pt. 1. Temperature dependence of damage.** Clinard, F.W. Jr.; Peterson, D.E.; Rohr, D.L. (Los Alamos National Lab., NM (USA). Materials Science and Technology Div.); Hobbs, L.W. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Materials Science and Engineering). *Journal of Nuclear Materials;* **126**: No. 3, 245-254(Nov 1984).

^{238}Pu-substituted cubic zirconolite ($CaPuTi_2O_7$) has stored near ambient temperature, at 575 K, and at 875 K until alpha decay doses as high as 6.1×10^{25} α/m^3 were attained. Self-damage at the lowest temperature proceeded by accumulation of alpha-recoil tracks was partly or wholly suppressed at the higher temperatures. Full conversion to the metamict condition near ambient temperature was accompanied by bulk swelling of 5.4 vol%. Self-damage at 575 K and 875 K was characterized by lesser amounts of swelling (4.3 vol% and 0.4 vol%); however, subsequent reduction of the storage temperature to ambient resulted in further swelling. Details of this swelling response imply structural differences between metamict states formed at 575 K and ambient temperature. Implications for self-irradiation effects in nuclear waste forms under variable temperature conditions are discussed.

31541 **General statistical description of the fracture particulates formed by mechanical impacts of brittle materials.** Mecham, W.J.; Jardine, L.J.; Reedy, G.T.; Steindler, M.J. (Argonne National Lab., IL). *Industrial and Engineering Chemistry Fundamentals;* **22**: No. 4, 384-391(1983).

The solid particulates formed in standard diametral and axial impact tests of small cylindrical specimens of glasses and ceramics were found to have size distributions that plotted as straight lines on log-normal graphical coordinates. Generalized log-normal parameters were defined for these empirical particle-size distributions according to particle masses (or volumes), surface areas, and particle numbers, including geometric mean shape factors for these distributions. These descriptive parameters were found to correlate with impact severity measured as impact kinetic energy per unit volume of the specimen for representative brittle materials, both vitreous and crystalline. These correlations also define impact strength as a property of materials and can be further generalized to model the impact-fracture process for large-scale as well as small-scale impact effects. Applications of the log-normal analysis were made for the characterization of particles adhering to dry surfaces and for the conditions under which particle fusion may occur in mechanical impacts.

31542 **Electronic structure of Si (111) interface between diamond and hexagonal phases.** Huang, M.Z.; Ching, W.Y. (Univ. of Missouri, Kansas City). *Solid State Communications;* **47**: No. 2, 89-92(1983). Contract AC02-79ER10462.

The electronic structure of the Si (111) interface between the diamond and hexagonal wurtzite structure is studied by first-principles linear combination of atomic orbital (LCAO) method. No gap interfacial states or resonances are found; instead, the calculated density of states curve shows an oscillatory redistribution of electron states and a reduction of band gap of about 10%. It is concluded that the electronic structure of this interface can be approximated as the average of that of the bulk diamond and the hexagonal Si.

3603 Composite Materials

REFER ALSO TO CITATION(S) 29712, 30597

31543 **(DOE/ER/10511—T4) Self-consistent approach to the elastic stiffness of short-fiber composites.** Chou, T.W.; Nomura, S.; Taya, M. (Delaware Univ., Newark (USA). Dept. of Mechanical and Aerospace Engineering). 1979. Contract AC01-79ER10511. 6p. NTIS, PC A02. File Number DE85011231.

The self-consistent approach originally proposed by Hill has been adopted to derive the effective elastic stiffness constants of unidirectional short-fiber composites. The short-fibers are modeled as ellipsoidal inclusions uniformly distributed in the matrix and the transverse isotropy of the composite has been taken into account. The method of analysis is valid for multi-component systems and hence, applicable to hybrid composites. Comparisons of this analysis with existing theories are made for binary composites.

31544 **(DOE/ER/10511—T6) Viscoelastic behavior of short-fiber composite materials.** Nomura, S.; Chou, T.W. (Delaware Univ., Newark (USA). Dept. of Mechanical and Aerospace Engineering). [1985]. Contract AC01-79ER10511. 21p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011233.

This paper examines the viscoelastic behavior of unidirectional short-fiber composites. Each fiber is approximated by an ellipsoidal elastic inclusion embedded in a viscoelastic matrix. The static correspondence principle which relates the viscoelastic problem to the elastic problem is applied to the modified version of the effective elastic moduli of short-fiber composites originally derived by the authors. Numerical examples for various fiber aspect ratios are derived based upon the collocation approximation method as well as the self-consistent model.

31545 **(N—85-17047) Effects of high energy radiation on the mechanical properties of epoxy-graphite fiber reinforced composites.** Fornes, R.E.; Gilbert, R.D.; Memory, J.D. (North Carolina State Univ., Raleigh (USA)). Dec 1984. 58p. (NASA-CR—174314). NTIS, PC A04/MF A01.

The effects of high energy radiation on the mechanical properties and on the molecular and structural properties of graphite fiber reinforced composites were assessed so that the durability of such composites in space applications could be predicted. Investigative techniques including ESR and infrared spectroscopy, ESCA, contact angle measurements, and dynamic and static mechanical testing (3-point bending and interlaminar shear) were employed. The results using these different techniques are individually described, and the implications of the data are discussed. The proposed plan of work for the next fiscal year is outlined.

31546 **(ORNL/TM—9381) Development and characterization of carbon-bonded carbon fiber insulation for radioisotope space power systems.** Wei, G.C.; Robbins, J.M. (Oak Ridge National Lab., TN (USA)). Jun 1985. Contract AC05-84OR21400. 44p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85013365.

The General-Purpose Heat Source (GPHS), an improved radioisotope heat source, employs a unique thermal insulation material, carbon-bonded carbon fiber (CBCF), to protect the fuel capsule and to help achieve the highest possible specific power. The CBCF insulation is made from chopped rayon fiber about 10 μm in diameter and 250 μm long, which is carbonized and bonded with phenolic resin particles. The CBCF shapes, both tubes and plates, are formed in a multiple molding facility by vacuum molding a water slurry of the carbonized chopped-rayon fiber (54 wt %) and phenolic resin (46 wt %). The molded shapes are subsequently dried and cured. Final carbonization of the resin is at 1600°C. Machining to close tolerances (+-0.08 mm) is accomplished by conventional tooling and fixturing. The resulting material is an excellent lightweight insulation with a nominal density of 0.2 Mg/m^3 and a thermal conductivity of 0.24 W(m.K) in vacuum at 2000°C. Several attributes that make CBCF superior to other known high-temperature insulation materials for the GPHS application have been identified. It has the excellent attributes of light weight, low thermal conductivity, chemical compatibility, and high-temperature capabilities. The mechanical strength of CBCF insulation is satisfactory for the GPHS application; it has passed vibration tests simulating launch conditions. The basic fabrication technique was refined to eliminate undesirable large pores and cracks often present in materials fabricated by earlier techniques. Also, processing was scaled up to incease the fabrication rate by a factor of 10. The specific properties of the CBCF were tailored by adjusting material and processing variables to obtain the desired results. We report here how work on CBCF characterization and development conducted at ORNL from 1978 through 1980 has contributed to the GPHS program to meet the requirements of both the Galileo and Ulysees Missions.

31547 **(SKBF-KBS-TR—82-19) Corrosion of steel in concrete.** Preece, C.M. (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). Oct 1982. 40p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701270.

A comparative study has been made of those properties of Massiv and Standard cements which are considered to determine their ability to protect steel reinforcement from corroding. Saturated Massiv cement has a higher evaporabel water content, but a significantly finer pore structure than has saturated Standard cement. This fine structure resulted in an electrical resistivity ten times higher and chloride diffusivity ten times lower than those of Standard cement. Electrochemical measurements have shown that the passive current density of steel in Massiv mortar is higher than that of steel in Standard mortar, but the higher current should lead to a more rapid decrease in potential to a level at which neither chloride attack of hydrogen evolution will occur. Whereas steel in Standard mortar was found to be highly susceptible to crevice corrosion, no such attack has been observed in Massiv mortar. Moreover, the initiation of chloride induced corrosion and the subsequent rates of corrosion were both lower in Massiv mortar than in Standard mortar. Thus, it may be predicted that Massiv cement would provide greater protection for steel reinforcement in underground structures exposed to chloride containing ground water than would Standard cement.

31548 **(UCRL—91305) Processing and microstructural characterization of B_4C-Al cermets.** Halverson, D.C.; Pyzik, A.J.; Aksay, I.A. (Lawrence Livermore National Lab., CA (USA); Washington Univ., Seattle (USA). Dept. of Materials Science and Engineering). Feb 1985. Contract W-7405-ENG-48. 21p. (CONF-850122—10). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85013195.

From 9. annual conference on composites and advanced ceramic materials and workshop on testing methods for ceramic matrix composites; Cocoa Beach, FL, USA (20 Jan 1985).

Reaction thermodynamics and wetting studies were employed to evaluate boron carbide-aluminum cermets. Wetting phenomenon and interfacial reactions are characterized using "macroscale" and "microscale" techniques. "Macroscale" evaluation involved aluminum sessile drop studies on boron carbide substrates. "Microscale" evaluation involved the fabrication of actual cermet microstructures and their characterization through SEM, x-ray diffraction, metallography, and electron microprobe. Contact-angle measurements and interfacial-reaction products are reported. 14 refs., 5 figs., 2 tabs.

31549 Flexural fatigue of short fiber reinforced high temperature thermoplastics. Yau, S.; Chou, T.W. (Univ. of Delaware, Newark). *SAMPE (Society for the Advancement of Material and Process Engineers) Quarterly;* **16:** No. 3, 18-21(Apr 1985). Contract FG02-84ER45087.

Short fiber reinforced thermoplastics are gaining increasing importance in the development of composite technology. In this investigation, the studies focus on three types of short glass fiber reinforced thermoplastics: (1) polyetherimide (PEI), (2) polyethersulphone (PES), and (3) polyetheretherketone (PEEK). These matrices possess good resistance to aviation fluids and ability to withstand high temperatures up to 600°F. Specimens were evaluated at room temperature and at elevated temperatures under both static and dynamic loads. Fatigue tests reported herein were performed on Krouse sheet bending fatigue machines, operating at 1750 cpm and a constant deflection mode. Fatigue data are presented in traditional S-N plots. 3 references, 5 figures.

31550 (CEA-CONF—7534) Aging irradiation of polymers. Dose-rate and test sequence influence. Alba, C.; Carlin, F.; Chenion, J.; Lemaire, F.; Le Meur, M.; Petitjean, M. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. d'Analyse de Surete). May 1984. 40p. (In French). (CONF-840516—8; DAS—83). NTIS (US Sales Only), PC A03/MF A01. File Number DE85751314.

From International symposium on aging in tests of safety equipment for nuclear power plants; Paris, France (15 May 1984).

This work brings up results of the irradiation dose-rate influence on mechanical and electrical properties of technical polymer materials evolution. Polymer samples were subjected to $3.3.10^{-2}$ $Gy.s^{-1}$ and $2.8.10^{-1}$ $Gy.s^{-1}$ dose-rate. Heat and radiation simultaneous action is usualy simulated sequentialy. The hardest simulation on the polymer is the sequence of irradiation followed by thermal aging not the reverse. This study was carried out on eight polymer materials among those used in the electrical appliances for P.W.R. nuclear power plants.

31551 (CEA-CONF—7535) Study on the radiation aging of polymers. Armand, X.; Berthet, J.; Gaussens, G.; Le Meur, M.; Petitjean, M. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. d'Analyse de Surete). May 1984. 30p. (In French). (CONF-840516—7; DAS—84). NTIS (US Sales Only), PC A03/MF A01. File Number DE85751313.

From International symposium on aging in tests of safety equipment for nuclear power plants; Paris, France (15 May 1984).

Ten representative polymeric materials for nuclear application are studied. The polymers examined are: resins (polyimide R.P., polyamide imide varnish, silicon resin), thermoplastic elastomers (VAMAC, EPDM, PRC et PRI), sulfur polymers (HYPALON, PPS, polysulfone). The test programme simulating a nuclear reactor service life, consist of three steps: i: γ irradiation dose of 18.10^4 Gray at 80°C; ii: accelerated thermal aging during 240 hours at a temperature of 120-140 or 160°C according to the polymer studied; iii: like the step i. Oxygen consumption is studied during the tests. Experiments are carried out at four dose-rate 14, 10^2, 10^3 and 5.10^3 Gray per hour. The $G(\text{-}O^2)$ of ten polymers decrease when dose increase, the smaller the dose-rate the higher the fullness of decrease.

31552 (DOE/CS/40294—1) Development and demonstration of a spiral-wound thin-film composite membrane system for the economical production of oxygen-enriched air, Phase IV. Final report, January 1, 1983-December 31, 1984. Haesloop, D.G.; Swedo, R.J.; Burnett, L.J. (UOP, Inc., San Diego, CA (USA). Fluid Systems Div.; UOP, Inc., Des Plaines, IL (USA)). 15 Jan 1985. Contract AC01-79CS40294. 146p. NTIS, PC A07/MF A01; 1; GPO Dep. File Number DE85012380.

Literature searches identified poly (vinyl isobutyl ether) as the most promising candidate barrier material for oxygen enrichment membranes. A membrane with an oxygen/nitrogen selectivity of 6.2 and a stability at 60°C was developed. However, this membrane is fragile. Membranes using poly (2-hexyne) and poly (6-methyl-2-heptyne) were also made. (DLC)

31553 (EUR—9226-FR) Improvement of the functional thermal conductivity of foamed polyurethane. Andreani, A.; Silvent, A.; Roux, G.; Balme, A.; Rivero, J.; Fogg, B. (Commission of the European Communities, Luxembourg. Directorate-General for Information, Market and Innovation). 1984. 59p. (In French). Commission of the European Communities, Luxembourg. Office of Official Publications of the European Communities.

Due to gas diffusion through the cell walls of rigid polyurethane foams, the K value of these products increases with time from about 18 mW/mK after processing to nearly 29 mW/mK, value used in France for thermal calculation. The aim of this research is to achieve a significant improvement in the functionnal thermal conductivity of foams to 20 mW/mK by inhibition the gas diffusion after reduction of the initial K value and without incurring a serious increase in manufacturing costs. This study was undertaken jointly by the CSTB and the CEA in collaboration with ICI France SA as raw materials producer and research member and SECMER as manufacturer of foaming equipment. The programme was divided into two parts. In a first stage and only with commercial raw materials, the decreasing of the initial thermal conductivity, $lambda_0$, measured 24 hours after processing is studied, as well as the asymptotic value lambdasub(infinite). During this stage the influence of the type and amount of catalyst, surfactant, foaming gas, the amount of air, the polyol type was taken in account. During the second stage a particular interest was given to the polyols modification to increase their diffusion barrier effect on polyurethane. In fact reduction of diffusion kinetics keeps the lambdasub(infinite) value at a lower level. The minimal lambdasub(infinite) got is 19.6 mW/mK.

31554 (NUREG/CR—4147) Effect of environmental stress on Sylgard 170 silicone elastomer. Buckalew, W.H.; Wyant, F.J. (Sandia National Labs., Albuquerque, NM (USA)). May 1985. Contract AC04-76DP00789. 89p. (SAND—85-0209). NTIS, PC A05/MF A01 - GPO. File Number TI85013268.

Dow Corning Sylgard 170 Silicone Elastomer has been investigated to characterize its response to accelerated thermal aging, radiation exposure, and its behavior under applied compressive forces. Sylgard 170 response to accelerated thermal aging suggests the material properties are not particularly age dependent. Radiation exposures, however, produce significant, monotonic changes in both elongation and hardness with increasing absorbed radiation dose. Elastomer response to an applied compressive force was strongly dependent on environment temperature and degree of material confinement. Variations in temperature produced large changes in compressive forces applied to confined samples. Attempts to mitigate force fluctuations by means of pressure relief paths resulted in total loss of the applied compressive force. Thus, seal applications employing this elastomer in Class 1E equipment required to function during or following an accident should consider the potential loss of compressive force from long-term aging and potential LOCA-temperature transient conditions.

31555 (ORNL—6134) Evaluation of polymer films for electrical insulation. McCoy, H.E. Jr. (Oak Ridge National Lab., TN (USA)). Apr 1985. Contract AC05-84OR21400. 96p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85013532.

Polymer films of several kinds were studied for use as electrical insulators. The studies were initiated in support of the development of gas transformers, in which SF_6 gas is used as the dielectric material and polymer films might be used as insulators. The polymers studied were polyethylene terephthalate, polycarbonate, polyethersulfone, polyparabanic acid, and polyimide. Samples were exposed to SF_6 at 0.4 MPa (4 atm) pressure and at 70, 100, 135, and 160°C for times to 23,000 h. Changes in properties during aging were monitored by periodically removing samples and performing visual, tensile, electrical breakdown, density, and microstructural tests. Tests on two lots of polyethylene terephthalate showed that strength increased and ductility decreased with increasing crystallinity. Tests were initiated on polyetherimide and polysulfone as well as some additional lots of the initial five polymers selected for evaluation. Tensile tests at elevated temperatures were used as one method to determine the maximum use temperatures. General creep characteristics as well as specific creep data were determined for six polymers. Differential thermal expansion distorted the polymer in a bonded polymer-metal composite, and a test was developed for evaluating this form of thermal strain fatigue failure. Some heating tests were run on a prototypic gas transformer coil wound of aluminum and two interlayers of polyethylene terephthalate. The largest problems noted in these tests were associated with thermal expansion mismatches between the structural components of the coil.

31556 **(AECL—7803) Chemical durability of alkali aluminosilicate glasses.** Tait, J.C.; Mandolesi, D.L. (Atomic Energy of Canada Ltd., Pinawa, Manitoba. Whiteshell Nuclear Research Establishment). Sep 1983. 45p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85900974.

The aqueous durabilities of a series of glasses based on the sodium aluminosilicate system (Na_2O-Al_2O_3-SiO_2) have been studied. The effects of molecular substitution of K_2O or CaO for Na_2O, and B_2O_3 for Al_2O_3 have been investigated. The temperature dependence of leaching in the Na_2O-B_2O_3-Al_2O_3-SiO_2 system was studied with glasses containing 2 wt percent simulated UO_2 fuel recycle waste. The results confirm that aluminosilicate glasses are more durable than their borosilicate counterparts. The leaching results are explained in terms of glass structure and bonding, and a general leaching mechanism for aluminosilicate glasses is presented.

31557 **(CBPF-NF—005/83) About counterintuitive orbital mixing and bond populations.** Jorge, F.E.; Giambiagi, M.; Giambiagi, M.S. de. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 17p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701416.

It is shown that negative bond and orbital populations may be avoided by the introduction of a weight factor in a bond index definition, together with a suitable parameterization. The negative bond populations found for first-row metal complexes need not be ascribed to counterintuitive orbital mixing but rather, essentially, to the equipartition of the charge distribution. Different definitions of the bond population are compared for ferrocene and the effects of some parameterizations are discussed.

31558 **(CBPF-NF—016/83) Electric field gradient and electronic structure of linear-bonded halide compounds.** Ellis, D.E.; Guenzburger, D.J.R.; Jansen, H.B. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 33p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701419.

The importance of covalent metal-ligand interactions in determining hyperfine fields and energy-level structure of MX_2 linear-bonded halide compounds has been studied, using the self-consistent local density molecular orbital approach. Results for $FeCl_2$, $FeBr_2$ and $EuCl_2$ obtained using the Discrete Variational Method with numerical basis sets are presented. The high spin configuration for the iron compounds, first predicted by Berkowitz, et al., is verified; a successful comparison with gas phase photoelectron spectra is made. Variation of the predicted electric field gradient with bond length R is found to be rapid; the need for an EXAFS measurement of R for the matrix isolated species and experimental determination of the spin of the EFG is seen to be crucial for more accurate determinations of the sub(57) Fe quadrupole moment.

31559 **(DGRST—81-D-0506) Determination of the thermodynamic properties of heavy organic fluids and research of compounds adapted to low temperature Ranking cycles.** Sagnes, P.; Verneau, A.; Massot, R. (Delegation Generale a la Recherche Scientifique et Technique (DGRST), 75 - Paris (France)). 1982. 78p. (In French). (DGRST—81-D-0507). NTIS (US Sales Only), PC A05/MF A01. File Number DE85751348.

In the energy recovery field, it is very important to get an efficiency that is the most possible nearly the theoretical maximum efficiency. This paper presents the development of a theoretical and experimental method, allowing to estimate quickly the interest of chemical compounds with a view to a utilization in low and medium temperature Rankine cycles. The works carried out consist in the following points: development of a method allowing, from some experimental data, to determine the thermodynamic properties (H, S, V) as a function of temperature and pressure; measurement of the specific heat of a fluid in the gaseous phase; study of the thermal behaviour of two fluids in the presence of usuals metals, study of the decomposition; contacts with industrialists. The results obtained show the validity of the proposed method.

31560 **(DP-MS—85-29) Recirculation within a glass mixture subjected to external and resistive heating.** Pepper, D.W. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). [1985]. Contract AC09-76SR00001. 15p. (CONF-850745—8). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85010068.

From 4. international conference on numerical methods in laminar and turbulent flow; Swansea, UK (8 Jul 1985).

Convective motion within a glass mixture undergoing external and resistive (joule) heating is numerically simulated. A time-split finite element technique and a pseudo-pressure formulation are used to solve the two- and three-dimensional primitive equations of motion. The viscosity, thermal diffusivity, and electrical conductivity vary as a function of temperature; the temperature varies from ambient to 1150°C. 15 refs., 4 figs.

31561 **(FRNC-TH—1893) Study of irradiation defects in GaAs.** Loualiche, S. (Institut National des Sciences Appliquees (INSA), 69 - Villeurbanne (France); Lyon-1 Univ., 69 - Villeurbanne (France)). Nov 1982. 173p. (In French). NTIS (US Sales Only), PC A08/MF A01. File Number DE85751319.

Characterization techniques: C(V) differential capacity, DLTS deep level transient spectroscopy, DDLTS double deep level transient spectroscopy and DLOS deep level optical spectroscopy are studied and theoretical and experimental fundamentals are re-examined. In particular the centres created by ionic or electronic bombardment of p-type GaAs. New quantitative theoretical bases for the C(V) method are obtained. Study of the optical properties of traps due to irradiation using DLOS. The nature of irradiation defects are discussed.

31566 (INIS-BR—251) **Color centers in KCN: ferro-elastic alignment and free optical absorption of phonons.** Grillo, M.L.N. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). 1983. 119p. (In Portuguese). NTIS (US Sales Only), PC A06/MF A01. File Number DE85701422.

Some color centers in KCN pure and KCL or KOH doped are studied. The used techniques for detection of these color centers were optical absorption and electron paramagnetic resonance (EPR). To obtain this color centers crystals were always exposed to X-rays. With an optical absorption technique, one color center was analysed after X-ray irradiation followed by a suitable photochemical process. Throught the EPR technique the F center and three other centers produced by radiation damage were observed through several KCN solid phases. As in the orthorhombic and ferroelastic phase (temperatures between 168K and 83K), the crystals of KCN present one multidomain structure responsable for strong light scattering on the optical absorption spectra and EPR spectra that does not present the resolved lines formed above 168K, one system of aligned domains was obtained through mechanical stress built specifically to be capable of reducing the number of distinct domain, and this allowed us to observe of partially resolved EPR lines.

31567 (INIS-BR—253) **Specific heat measurements in KCN:KCL mixed crystals.** Ghivelder, L. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). 1983. 111p. (In Portuguese). NTIS (US Sales Only), PC A06/MF A01. File Number DE85701423.

An adiabatic calorimeter to perform specific heat measurements of small samples (approximatelly 150 mg) was built. The measurements were taken from 6 to 120 K, iN KCN:KCL mixed crystals, in order to observe the evolution of the antiferroelectric phase transition - that occurs at 83 K in KCN pure. From the experimental results the values of the phase transition critical temperature are found, for some particular concentrations of the mixture, and it was detected that this phase transition disappears with only 10% of Cl^-. This result is explained in terms of a change of the potential wells in the crystal.

31568 (JAERI-M—83-231) **Effect of hydrogen on reaction of graphite with water vapor.** Imai, Hisashi; Fujii, Kimio; Kurosawa, Takeshi; Nomura, Shinzo. (Japan Atomic Energy Research Inst., Tokyo). Jan 1984. 21p. (In Japanese). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701037.

The effect of hydrogen on the rate of reaction with water vapor was studied for four kinds of graphites including IG-11 which is a candidate material for use in the core of the Experimental High Temperature Gas-cooled Reactor. The experiment was carried out at 800 - 1000sup(o)C in the helium flow which contained 0.65 - 1.0 % water vapor and 0 - 1.5 % hydrogen. The rate of reaction with water vapor decreased by addition of hydrogen and the effect of hydrogen was much larger for highly purified graphite than for contaminated one. Based on the experimental results, the effect of hydrogen in the reactor condition was estimated and it was shown to be negligible small at such impurity level as the coolant of the reactor.

31569 (JINR—R-14-83-855) **Investigation of phase transitions in a superionic conductor using the neutron scattering method.** Belushkin, A.V.; Vonsitski, Ya.; Natkanets, I.; Plakida, N.M.; Shuvalov, L.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics). 1983. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701030.

The results of investigations of cesium hydrosulfate $CsHSO_4$ on the IBR-2 pulsed reactor are reported. This is the first experiment on neutron scattering in a superionic conductor with a high conductivity due to proton diffusion. The phase transition in metastable phase near 328 K, phase transitions between 328-404 K and 404-423 K have been found. The inelastic neutron scattering spectra have been measured for temperatures 291 K, 328 K, 404 K, 423 K which correspond to different phases of $CsHSO_4$. Data were analysed, diffusion coefficient for protons was estimated and necessary spectrometer resolution to observe diffusion process in this sample was obtained.

31570 (LBL—19452) **Model of amorphous silicon layer regrowth.** Ling, P.; Washburn, J. (Lawrence Berkeley Lab., CA (USA)). Apr 1985. Contract AC03-76SF00098. 10p. (CONF-850421—9). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012608.

From 2. spring meeting of the Materials Research Society; San Francisco, CA, USA (15 Apr 1985).

A new model which combines heterogenous nucleation and growth process to explain the mechanism of the crystal regrowth of amorphous silicon, in contact with a Si single crystal substrate, is presented. This model explains the effects of substrate orientation and impurity concentration on the kinetics of crystal regrowth. A comparison of experimental results with the predictions of the model is also included. 10 refs., 5 figs.

31571 (LBL—19466) **Formation of amorphous silicon by light ion damage.** Shih, Y.; Washburn, J.; Weber, E.R.; Gronsky, R. (Lawrence Berkeley Lab., CA (USA)). Apr 1985. Contract AC03-76SF00098. 10p. (CONF-850421—8). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012605.

From 2. spring meeting of the Materials Research Society; San Francisco, CA, USA (15 Apr 1985).

A model for formation of amorphous silicon by light ion implantation is proposed. It is suggested that accumulation of point defects and/or complexes is required at the initial stage of the amorphization process. Amorphous zone can only form at the end of incoming light ion tracks when the pre-accumulated concentration of point defects reaches a critical value. Depending on the uniformity of point defect distribution, two possibilities for the second stage of amorphization are suggested for the ion implantation at different temperature. Silicon wafers implanted with Boron ions at various temperatures with below and above the critical amorphization dose have been investigated using cross section specimens in high resolution TEM. The amorphization process has as well been studied by Electron Paramagnetic Resonance of the same samples investigated by TEM, allowing the identification of dangling bonds in amorphous zones and point defect clusters. (113), 1/3(111) extrinsic and other smaller distortion 1/x(111) stacking faults were also found during the amorphization process. Liquid nitrogen temperature and/or high beam current were found to be necessary to amorphizate Silicon by Boron ion implantation.

31572 (N—85-19847) **Material growth and characterization for solid state devices.** Stefanakos, E.K.; Collis, W.J.; Abul-Fadl, A.; Iyer, S. (North Carolina Agricultural and Technical State Univ., Greensboro (USA)). Nov 1984. 22p. (NASA-CR—174410). NTIS, PC A02/MF A01.

Manganese was used as the dopant for p-type InGaAs layers grown on semi-insulating (Fe-doped) and n-type (Sn-doped) InP substrates. Optical, electrical (Hall) and SIMS measurements were used to characterize the layers. Mn-diffusion into the substrate (during the growth of In GaAs) was observed only when Fe-doped substrates were used. Quaternary layers of two compositions corresponding to wavelengths (energy gaps) of approximated 1.52 micrometers were successfully grown at a constant temperature of 640 C and InP was grown in the temperature range of 640 C to 655 C. A study of the effect of pulses on the growth velocity of InP indicated no significant change as long as the average applied current was kept constant. A system for depositing films of Al2O3 by the pyrolysis of aluminum isopropoxide was designed and built. Deposited layers on Si were characterized with an ellipsometer and exhibited indices of refraction between 1.582 and 1.622 for films on the order of 3000 A thick. Undoped and p-type (Mn-doped) InGaAs epitaxial layers were also grown on Fe-doped InP substrates through windows in sputtered SiO2 (3200 A thick) layers.

31573 (NAC-AR—84-01, pp 221-224) **Report of the Van de Graaff Group: solid state and materials research. Stability of palladium silicide.** Comrie, C.M.; Leitner, J.; Egan, J. (Cape Town Univ. (South Africa). Dept. of Physics); Pretorius, R. 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE85780939.

In Annual report June 1984. [Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Center].

In the investigation Pd was deposited on to a Si(III) substrate and annealed at 850 degrees Celcius to form PdSi. Following this an additional layer of Pd was evaporated on top of the silicide to produce a Si/PdSi/Pd structure. On subsequent annealing at temperatures as low as 300 degrees Celsius it was found that the free metal reacted with the silicide to produce Pd_2Si. It appeared that the ease of PdSi formation following implantation of Pd_2Si is not because of the PdSi layer between the Si and Pd_2Si but is probably due to structural alteration of the Pd_2Si layer during implantation. Rutherford backscattering was used in this investigation.

31574 (NAC-AR—84-01, pp 226-228) **Report of the Van de Graaff Group: solid state and materials research. The influence of Au on the formation of cobalt and nickel silicides.** Pretorius, R.; Ras, H.A.; Cruywagen, J.C. (Stellenbosch Univ. (South Africa). Dept. of Chemistry). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE85780939.

In Annual report June 1984. [Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Center].

The influence of gold on the formation of cobalt and nickel silicides is dealt with. In the case of cobalt silicide formation it was found that by putting thin layers of gold (14A - 200A) between the cobalt metal (1500A) and the silicon substrate, the normal trends of cobalt silicide formation were greatly altered. The influence of gold was measured by means of Rutherford backscattering.

31575 (NAC-AR—84-01, pp 189-190) **Report of the Van de Graaff Group: atomic physics. The manufacture of hydrocarbon cracked foils.** Coetzer, F.J.; Kotze, T.C.; Van der Westhuizen, P. (Stellenbosch Univ. (South Africa)). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE85780939.

Short note.

In Annual report June 1984. [Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Center].

31576 (ORNL/TM—9412) **Radiolytic gas generation rates from Hanford RHO-CAW sludge and double-shell slurry immobilized in grout.** Friedman, H.A.; Dole, L.R.; Gilliam, T.M.; Rogers, G.C. (Oak Ridge National Lab., TN (USA)). Jun 1985. Contract AC05-84OR21400. 63p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85013519.

Cement-based grouts will be used to immobilize low-level waste solutions at the Rockwell Hanford Operations (RHO) in Richland, Washington. The radioactivity in these aqueous encapsulated waste solutions can cause decomposition of the pore water in these grouts. Concern has been expressed over the potential for pressurizing the waste packages used to contain this material and the flammability and explosion hazards from hydrogen gas from this decomposition. Oak Ridge National Laboratory (ORNL) undertook the task of establishing the radiolytic gas production rates for the two types of RHO waste streams - current acid waste (CAW) and double-shell slurry (DSS) - and determining the composition of the generated gases, the effects of surface-to-volume ratio of the samples, waste slurry particle sizes, and the water content of the waste form. The alpha exposure of the grouts containing RHO-CAW sludge (with NO_3^-) produced H_2 and O_2 at almost a 2:1 ratio, with a trace of N_2O. The alpha irradiation of the grouts containing the DSS solution (with both NO_3^- and NO_2^-) produced mainly N_2O, H_2, and a trace of CH_4. In this case, O_2 and N_2 were either produced or consumed, depending upon when the sample was collected. During the gamma radiolysis of the grouts containing the DSS solution, N_2O, H_2O, N_2, and a trace of CH_4 were produced. In this case, O_2 from the air in the system was consumed. The average G/sub t/ value for the grout containing the RHO-CAW sludge exposed to alpha irradiation was 0.42 molec/100 eV, which is close to that for the gamma exposure of pure water (0.45 molec/100 eV). A G/sub t/ value of 0.12 molec/100 eV was obtained for the grout containing the DSS solution from the alpha exposure. As expected, a smaller G/sub t/ value of 0.018 molec/100 eV was obtained for the gamma exposure of the grout with DSS solutions.

31577 (PB—85-171452/XAB) **Effects of acid deposition on the properties of portland cement concrete: state of knowledge.** Webster, R.P.; Kukacka, L.E. (Brookhaven National Lab., Upton, NY (USA)). Feb 1985. 44p. NTIS, PC A03/MF A01.

Presented are the results of a program conducted to determine the state-of-the-art knowledge pertaining to the effects of acid deposition on the properties of portland cement concrete structures. Information was collected from a computerized literature survey, interviews, and replies to mail and telephone inquiries addressed to cement and concrete researchers and to governmental agencies and private firms active in the maintenance and restoration of concrete structures.

31578 (PUC-TN—11/83) **Electric dipole ordering in alkali-cyanides: NaCN and KCN.** Koiller, B.; Davidovich, M.A.; Carmo, L.C.S. do; Luety, F. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). 1983. 19p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701429.

A simple model for the low temperature electrically ordered state of NaCN and KCN is presented. The model takes into account electric dipole dressing effects which include cationic displacements determined experimentally. The ground state structure and the calculated values for the local electric fields are in fair agreement with experimental results. A parametrization for the elastic potencial confirms the plausibility of these model.

31579 (SAND—84-2287C) **Dangling bonds and sub-gap optical absorption in silicon.** Seager, C.H.; Lenahan, P.M.; Brower, K.L.; Mikawa, R.E. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 7p. (CONF-850421—5). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011752.

From 2. spring meeting of the Materials Research Society; San Francisco, CA, USA (15 Apr 1985).

The silicon "dangling bond" defect plays a large part in controlling the electronic properties of a-Si, polycrystalline silicon, and Si/SiO_2 interface. Jackson et al. have suggested that transitions of electrons occupying this defect produce the Urbach-like sub-gap absorption tail seen in two of these materials. We have performed optical and electron spin resonance measurements on polycrystalline silicon, plastically deformed silicon, and Si/SiO_2 interfaces to further examine this contention. In addition to seeing no measurable absorptance due to dangling bond interface states in the latter system, we conclude from the poor correlation of ESR signals with optical data that the Urbach tail in polycrystalline and deformed silicon is not due to transitions of dangling bond electrons.

31580 (SAND—85-0947) **Shock and release equation of state of calcite.** Grady, D.E.; Moody, R.L. (Sandia National Labs., Albuquerque, NM (USA)). May 1985. Contract AC04-76DP00789. 26p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85013151.

Studies were initiated to investigate the unloading response of carbonate minerals from high-pressure Hugoniot states between 10 to 100 GPa. A two-stage gun facility was used. Several impact experiments are reported on crystallite calcite for shock pressure below 10 GPa. Results are compared with other Hugoniot data on various calcium carbonate rocks and minerals. 11 figs. (DLC)

31581 **(UCRL—91429) Pulse duration dependence of 1064-nm laser damage thresholds of porous silica antireflection coatings on fused silica substrates.** Milam, D.; Thomas, I.M.; Weinzapfel, C.; Wilder J.G. (Lawrence Livermore National Lab., CA (USA)). 30 May 1985. Contract W-7405-ENG-48. 15p. (CONF-8410276—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013207.

From Boulder damage symposium; Boulder, CO, USA (15 Oct 1984).

We used 1064-nm pulses with durations of 1, 5, 9 ns to measure laser-damage thresholds of 10 porous silica antireflection coatings deposited from both methanol and ethanol solutions containing silica particles with diameters of 10-20 nm. The median thresholds measured at the three pulse durations, 10.8 J/cm^2, 26.5 J/cm^2, and 38 J/cm^2, scaled as pulse duration to the 0.56 power. 4 refs., 3 figs., 1 tab.

31582 **(UCRL—92682) Single-point diamond crushing of Zerodur with in-situ polishing and metrology on a diamond turning machine.** Bryan, J.B.; Carter, D.L. (Lawrence Livermore National Lab., CA (USA)). 1 Apr 1985. Contract W-7405-ENG-48. 11p. (CONF-8504139—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012918.

From Glancing incident optics-fabrication workshop; Annapolis, MD, USA (1 Apr 1985).

Large, complicated, aspherical optical elements of glass are presently used in many astronomical devices, both on land and in space. Grazing-incident mirrors are envisioned for use in such missions as the proposed Advanced X-Ray Astrophysical Facility (AXAF), the Far Ultraviolet Spectroscopic Explorer (FUSE), and others. These elements are very expensive to fabricate because a great deal of time and labor are required to shape a glass blank. The fabrication of these mirrors can best be achieved by applying precision machining techniques and precision machines for figuring and finishing low-expansion glasses such as Zerodur.

31583 **Vacuum surface flashover: A high-pressure phenomenon.** Gray, E.W. (Sandia National Laboratories, Albuquerque, New Mexico, 87185). *Journal of Applied Physics;* **58**: No. 1, 132-141(1 Jul 1985).

Desorbed gases from insulator surfaces may be much more important in flashover initiation than properties of the dielectric surface. Ambient neutral densities, immediately above the insulator surface, in the initial stages of flashover have been calculated to lie in the range from 2 x 10^{17}/cm^3 to 2 x 10^{21}/cm^3 with a mean of about 1 x 10^{19}/cm^3, whether flashover occurred on surfaces in air at atmospheric pressure or in vacuum as low as 10^{-6} Torr. The evidence presented indicates that, for dc and microsecond pulse voltages, surface flashover is a local, relatively high-pressure phenomenon. Comparison of field strengths of surface flashover for various insulating materials perpendicular to the electrodes, operating pressures, and voltage waveforms appears to indicate that flashover values range well within an order of magnitude (~18—80kV/cm). A filamentary nature of the flashover discharge is shown and is consistent with gas breakdown phenomena. Ionization wave front velocities are examined and these compare favorably with those obtained from gaseous breakdown studies.

31584 **Theory of deep level trap effects on generation-recombination noise in HgCdTe photoconductors.** Iverson, A.E.; Smith, D.L. (Program in Applied Mathematics, University of Arizona, Tucson, Arizona 85721 and Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Applied Physics;* **58**: No. 1, 579-587(1 Jul 1985).

We present a theory of the effect of deep level centers on the generation-recombination (g-r) noise and responsivity of an intrinsic photoconductor. The deep level centers can influence the g-r noise and responsivity in three main ways: (i) they can shorten the bulk carrier lifetime by Shockley—Read—Hall recombination; (ii) for some values of the capture cross sections, deep level densities, and temperature, the deep levels can trap a significant fraction of the photogenerated minority carriers. This trapping reduces the effective minority carrier mobility and diffusivity and thus reduces the effect of carrier sweep out on both g-r noise and responsivity; (iii) the deep level centers add a new thermal noise source, which results from fluctuations between bound and free carriers. The strength of this new noise source decreases with decreasing temperature at a slower rate than band-to-band thermal g-r noise. Calculations have been performed for a X = 0.21, n-type Hg/sub 1-x/Cd/sub x/Te photoconductor using the parameters of a commonly occurring deep level center in this material. We find that for typical operating conditions photoconductive detector performance begins to degrade as the deep level density begins to exceed 10^{16} cm^{-3}.

31585 **Radiation-induced transient acoustic loss in quartz crystals.** Koehler, D.R.; Martin, J.J. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Journal of Applied Physics;* **57**: No. 12, 5205-5210(15 Jun 1985). Contract AC04-76DP00789.

When exposed to pulsed ionizing radiation, quartz oscillator crystals can exhibit transient acoustic losses (a decrease in Q) and transient frequency shifts. Although these changes are usually most pronounced in unswept quartz, they have also been seen in swept quartz. We have directly measured the transient acoustic loss in both synthetic and natural quartz. The synthetic quartz samples included hydrogen and lithium swept units. Irradiations were accomplished at REBA, a flash x-ray facility at Sandia Laboratories. Log decrement acoustic loss measurements were made over the 110—400 K temperature range and show a time dependence similar to a t^{-1}/sup //^{2} behavior characteristic of one-dimensional diffusion. The transient loss showed a broad temperature dependence ascribed to alkali ions moving along the Z-axis channels. Peaks at 360 and 380 K in the transient loss temperature spectra are thought to be due to an unstable defect which momentarily traps the alkali ion.

31586 **Solid-solid phase transitions and soft phonon modes in highly condensed Si.** Chang, K.J.; Cohen, M.L. (Department of Physics, University of California, Berkeley, California 94720 and Materials and Molecular Research Division, Lawrence Berkeley National Laboratory, Berkeley, California 94720). *Physical Review [Section] B: Condensed Matter;* **31**: No. 12, 7819-7826(15 Jun 1985).

The pseudopotential method is used to examine the structural transitions of Si from β-Sn to simple hexagonal (sh) to hexagonal close packed (hcp). The calculated transition pressures, transition volumes, and c/a ratios are in good agreement with the measured values. Furthermore, the phase-transition pressure from hexagonal close packed to face-centered cubic is predicted to be 1.2 Mbar. The phonon frequencies are also calculated with use of the frozen-phonon approximation for the β-Sn, sh, and hcp phases. For both the β-Sn and sh phases, pressure-sensitive soft phonon modes exist. These are the longitudinal optic mode at the Brillouin-zone center for β-Sn and the transverse acoustic mode at the Brillouin-zone boundary for sh in the [001] direction. These soft modes are most likely associated with the phase transformations from β-Sn to sh to hcp. The metallic sh phase has strong covalent interlayer bonding. This is opposite to the case for the graphite structure. The weak bonding in the hexagonal plane of the sh phase causes the soft transverse mode for this phase.

31587 **Intensities and asymmetries of electronic Raman scattering in $ErPO_4$ and $TmPO_4$.** Becker, P.C.; Edelstein, N.; Williams, G.M.; Bucher, J.J.; Russo, R.E.; Koningstein, J.A.; Boatner, L.A.; Abraham, M.M. (Materials and Molecular Research Division, Lawrence Berkeley Laboratory, Berkeley, California 94720 and Department of Physics, University of California, Berkeley, California 94720). *Physical Review [Section] B: Condensed Matter;* **31**: No. 12, 8102-8110(15 Jun 1985).

An investigation of the low-temperature electronic Raman scattering spectra of $ErPO_4$ and $TmPO_4$ has been carried out. The experimental intensities have been compared with the standard second-order theory of two-photon processes for both intermultiplet and intramultiplet transitions between individual crystal-field levels. Adequate agreement is found in the case of $ErPO_4$, but serious discrepancies exist for $TmPO_4$. It is shown that electronic Raman scattering is a sensitive technique for testing the Judd-Ofelt—type theories of two-photon processes in rare-earth crystals. Strong asymmetry, a characteristic feature of electronic Raman scattering, has been observed in several of the transitions.

31588 **Chemical trends in ground- and excited-state properties of interstitial 3d impurities in silicon.** Katayama-Yoshida, H.; Zunger, A. (Solar Energy Research Institute, Golden, Colorado 80401). *Physical Review [Section] B: Condensed Matter;* **31**: No. 12, 8317-8320(15 Jun 1985).

A spin-polarized local-density Green's-function calculation for tetrahedral interstitial 3d impurities in silicon reveals a new energy-level scheme that explains the observed chemical trends both in ground-state properties (hyperfine coupling constants and g values) and in excited-state properties (donor and acceptor ionization energies).

31589 **Observation of a C-1s core exciton in diamond.** Morar, J.F.; Himpsel, F.J.; Hollinger, G.; Hughes, G.; Jordan, a.J.L. (IBM Thomas J. Watson Research Center, Box 218, Yorktown Heights, New York 10598). *Physical Review Letters;* **54**: No. 17, 1960-1963(29 Apr 1985).

A well-resolved core exciton at the bulk diamond C-1s absorption edge has been observed using high-resolution partial-yield spectroscopy with synchrotron radiation. The obtained excitonic binding energy, 0.19 +- 0.015 eV, agrees well with a first-principles effective-mass approximation (EMA). This is in sharp contrast to other semiconductors (Si, Ge, and GaAs) where reported excitonic shifts far exceed EMA estimates. In light of these results, one must question whether previous measurements overestimate the core-hole interaction or if they indicate a breakdown of the EMA for core excitons.

31590 **Neutron diffraction study of natrolite, $Na_2Al_2Si_3O_{10}.2H_2O$, at 20 K.** Artioli, G.; Smith, J.V. (Chicago Univ., IL (USA). Dept. of Geophysical Sciences); Kvick, Aa. (Brookhaven National Lab., Upton, NY (USA)). *Acta Crystallographica, Section C: Crystal Structure Communications;* **40**: No. 10, 1658-1662(15 Oct 1984).

Msub(r) = 3041.84, orthorhombic, Fdd2, a = 18.272 (6), b = 18.613 (6), c = 6.593 (2) A, V = 2242 (2) A^3, Z = 8, Dsub(x) = 2.25 g cm^{-3}, Ge(331)-monochromatized neutrons, lambda = 0.8263 (1) A, $\mu = 0.404$ cm^{-1}, 20 K, $R(F^2) = 0.044$ (1976 reflections). The tetrahedral sites have complete Al_2Si_3 order. Although the Si-O and Al-O distances correlate inversely with the Si-O-Al angle as for other ordered fibrous zeolites, there are differences which may relate to the ionic potential of the extraframework cations.

31591 **(BARC—1207) Synthesis of tetrabutyl tin and its performance characteristics in liquid scintillation counting for radioimmunoassay.** Iyengar, T.S.; Vaze, P.K.; Dhane, D.L.; Gaiki, G.M. (Bhabha Atomic Research Centre, Bombay (India)). 1983. 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85900995.

The preparation, purification and identification of tetra-n-butyl tin is described. Its performance in liquid scintillation counting of the low-energy gamma emitter, iodine-125 used in radioimmunoassay and optimization of the counting procedures with special vials are also reported. 4 refs., 4 figs., 4 tabs.

31592 **(DEMO—83/12G) Parameters of chambers for radon extraction from liquid samples.** Kritidis, P. (Democritos Nuclear Research Center, Athens (Greece)). Sep 1983. 13p. (In Greek). NTIS (US Sales Only), PC A02;MF A01. File Number DE85701507.

The parameters influencing radon deemanation from water samples are examined on the basis of four different models concerning finite sample- and continuous measurements. Expressions are derived for a properly defined deemanation coefficient, the water-to-air 1/1 liter radon transfer and the radon outlet flow rate, as functions of air and water flow rates, the solubility coefficient of radon in water and other characteristic parameters. The linear-shaped deemanator with inverse air and water flows is found to provide more intensive radon extraction, as compared with one involving quick homogenization of radon concentrations within its volume.

31593 **(DEMO—83/14) Accumulation of radon in a measuring chamber during different variants of measurement.** Kritidis, P.; Mivev, L.; Uzunov, I. (Democritos Nuclear Research Center, Athens (Greece)). Oct 1983. 16p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701508.

Accumulation of radon in a scintillation or ionization chamber has been studied on the basis of a simple general model. The expressions derived apply to a number of different procedures for determination of radon concentrations in air, water and soil gas. Certain conclusions have been drawn concerning, for instance, the selection of extraction procedure for single and for continuous measurements of radon in water.

31594 **(DOE/ER/13202—1) Studies of the analyte-carrier interface in multicomponent flow injection analysis, June 1, 1984-March 15, 1985.** Brown, S.D. (Washington State Univ., Pullman (USA). Dept. of Chemistry). 1985. Contract FG06-84ER13202. 6p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85010615.

This project involves the use of digital filtering techniques to analyze the responses obtained by a scanning detector in a flow injection system. Detection is primarily by rapid-scan square-wave voltammetry, with multiple square-wave voltammograms obtained within the time it takes a single injected bolus to pass through the detector. Mathematical analysis of the data obtained from the rapid-scan detector is accomplished by various forms of the Kalman filter, a recursive digital filter. Objectives include the demonstration of multicomponent analysis using flow injection, and the study of diffusion-controlled chemical reactions between the components of an injected sample plug and reagents present in the carrier solution. During the past nine months, we have presented two talks on the results of our early work on the flow injection studies with the lead-thallium test system. We have demonstrated a detection limit near 10^{-6} M for both species using the flow detector and we observed that mixtures (with concentration ratios of up to 10:1, with either component in excess) could be analyzed with accuracies around 5%. We have also published a short paper on the limits of a similar resolution in static (no flow) systems.

31595 **(DPST—85-273) Reaction of uranium and the fluorocarbon FC-75.** Young, R.H. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 4 Apr 1985. Contract AC09-76SR00001. 21p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012322.

Because of criticality concerns with water cooling in enriched uranium upgrading, a fluorocarbon has been evaluated as a replacement coolant for internal module components in the Plasma Separation Process (PSP). The interaction of bulk uranium and of powdered uranium with FC-75 has been investigated at temperatures between 200 and 700°C. The gas pressure and the metal temperature were monitored as a function of time. Modest temperature changes of 50 to 100°C were observed for the bulk uranium/fluorocarbon reaction. Much larger changes (up to 1000°C) were noted for the reaction involving high surface area uranium powder. These temperature transients, particularly for the powdered uranium reaction, were short-lived (<10 seconds) and indicative of the formation of a protective layer of reaction products. Analysis of residual gas products by infrared spectroscopy indicated that one potentially serious hazard, UF_6, was not present; however, several small toxic fluorocarbons were produced by thermolysis and/or reaction. X-ray diffraction analysis of the residual solids indicated UF_4 and UO_2 were the major solid products. 5 refs., 11 figs., 1 tab.

31596 **(IA—1404, pp 136-137) Model for identification and quantitative analysis of materials by x-ray fluorescence.** Segal, D. Jul 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85780940.

31597 (IAEA-TECDOC—323) **Quality assurance in biomedical neutron activation analysis. Report of an advisory group meeting organized by the IAEA and held in Vienna, 13-17 September 1982.** (International Atomic Energy Agency, Vienna (Austria)). Nov 1984. 208p. (CONF-8209272—Summ.). NTIS (US Sales Only), PC A10/MF A01. File Number DE85780941.

From Advisory group meeting on quality assurance in biomedical neutron activation analysis; Vienna, Austria (13 Sep 1982).

The summary report represents an attempt to identify some of the possible sources of error in in vitro neutron activation analysis of trace elements applied to specimens of biomedical origin and to advise on practical means to avoid them. The report is intended as guidance for all involved in analysis, including sample collection and preparation for analysis. All these recommendations constitute part of quality assurance which is here taken to encompass the two concepts - quality control and quality assessment. Quality control is the mechanism established to control errors, while quality assessment is the mechanism used to verify that the analytical procedure is operating within acceptable limits.

31598 (IAEA-TECDOC—323, pp 39-51) **Relative accuracy, precision and frequency of use of neutron activation analysis and other techniques as revealed by the results of some recent IAEA intercomparisons.** Dybczynski, R. (Institute of Nuclear Research, Warsaw (Poland)). Nov 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780941. (CONF-8209272—Summ.).

From Advisory group meeting on quality assurance in biomedical neutron activation analysis; Vienna, Austria (13 Sep 1982).

Results of some IAEA intercomparisons organised during the past 10 years are examined with special reference to the analysis of materials of bio-environmental relevance. Overall, neutron activation analysis (NAA) contributed a greater fraction of the results than any other technique. Literature data for NBS reference materials also reveals a high frequency of use of NAA. It is concluded that NAA is now a mature technique that provides results of satisfactory accuracy and precision for many trace elements. Relatively frequently, however, results reported by individual laboratories can be identified as outliers, indicating that systematic errors are a common occurrence with NAA as with other trace analysis techniques.

31599 (IAEA-TECDOC—323, pp 53-69) **Need for improved quality assurance in biomedical neutron activation analysis as revealed by the results of some recent IAEA intercomparisons.** Parr, R.M. (International Atomic Energy Agency, Vienna (Austria)). Nov 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780941. (CONF-8209272—Summ.).

From Advisory group meeting on quality assurance in biomedical neutron activation analysis; Vienna, Austria (13 Sep 1982).

Results of three IAEA intercomparisons with animal muscle (H-4), animal bone (H-5) and human hair (HH-1) are examined and compared with the predictions of Guinn and Hoste as regards the precision that should be attainable by neutron activation analysis (NAA) techniques. In practice, there are wide discrepancies between the results reported by different laboratories which far exceed the predicted precisions. Ca, Cl, Cu, Fe, K, Mg, Se and Zn exhibit the smallest variability; As, Hg, I and Mn occupy an intermediate position; and Cd, Co, Cr, Mo and Sb show extreme variability (up to several orders of magnitude). It is concluded that these problems are caused, in part, by the use of an inappropriate technique, e.g. instrumental NAA instead of radiochemical NAA.

31600 (IAEA-TECDOC—323, pp 71-82) **Collection and manipulation of samples for trace element analysis. Quality assurance considerations.** Versieck, J. (Department of Internal Medicine, Div. of Gastroenterology, University Hospital, Ghent (Belgium)). Nov 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780941. (CONF-8209272—Summ.).

From Advisory group meeting on quality assurance in biomedical neutron activation analysis; Vienna, Austria (13 Sep 1982).

Evidence has accumulated that inadequate sample collection and manipulation is a virulent source of error in trace element analysis. There are a number of factors that threaten sample integrity - undoubtedly, contamination with exogenous material is the most important. This working paper concentrates on the errors that may be introduced during the collection and manipulation of blood and serum samples.

31601 (IAEA-TECDOC—323, pp 107-119) **Preparation and use of chemical irradiation standards.** Byrne, A.R. (Institut Jozef Stefan, Ljubljana (Yugoslavia)). Nov 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780941. (CONF-8209272—Summ.).

From Advisory group meeting on quality assurance in biomedical neutron activation analysis; Vienna, Austria (13 Sep 1982).

Problems and errors associated with the use of chemical standards in neutron activation are discussed, particularly aqueous solutions used in trace analysis, with emphasis on radiochemical methods. Practical experience with problem-free solutions is given, and some pitfalls mentioned, together with recommendations for reducing errors likely to arise in the use of such standards.

31602 (IAEA-TECDOC—323, pp 121-124) **Error sources involved in pre-irradiation separations.** Goeij, J.J.M. de (Interuniversitair Reactor Inst., Delft (Netherlands)). Nov 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780941. (CONF-8209272—Summ.).

From Advisory group meeting on quality assurance in biomedical neutron activation analysis; Vienna, Austria (13 Sep 1982).

Contamination and other error sources in pre-irradiation separations in biomedical neutron activation analysis are discussed. These separations may be used for differentiation of the matrix as to cell types and cell constituents, (bio)chemical speciation of the analyte, removal of interfering elements, and/or concentration of the analyte.

31603 (IAEA-TECDOC—323, pp 125-148) **Sources of errors in reactor neutron activation analysis of biological samples.** Sankar Das, M. (Bhabha Atomic Research Centre, Bombay (India). Analytical Chemistry Div.). Nov 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780941. (CONF-8209272—Summ.).

From Advisory group meeting on quality assurance in biomedical neutron activation analysis; Vienna, Austria (13 Sep 1982).

This paper focusses some of the sources of errors in Neutron Activation Analysis of biological samples arising from contamination of samples during irradiation, flux variation during irradiation, threshold reaction interferences and typical spectral interferences in quantitation. Use of reference samples as comparators in the preparation of new standards can lead to hereditary transfer of errors. To assess the analytical data in INAA use of ion-exchange resin loaded standards allow the preparation of required compositions. The importance of S/N ratio in quantitation by NAA is demonstrated.

31604 (IAEA-TECDOC—323, pp 149-152) **Optimization of reactor neutron activation analysis conditions.** Guinn, V.P. (California Univ., Irvine (USA). Dept. of Chemistry). Nov 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780941. (CONF-8209272—Summ.).

From Advisory group meeting on quality assurance in biomedical neutron activation analysis; Vienna, Austria (13 Sep 1982).

BASIC-PLUS and FORTRAN-4.

Analyses of the maximum precision attainable, under given neutron flux and other conditions, can be achieved, possible errors avoided, and much time saved by using an INAA Advance Prediction Computer Program prior to actual analyses. Such an APCP is described, and its availability indicated.

31605 (IAEA-TECDOC—323, pp 153-161) **Error sources involved in radiochemical processing.** Goeij, J.J.M. de (Interuniversitair Reactor Inst., Delft (Netherlands)). Nov 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780941. (CONF-8209272—Summ.).

From Advisory group meeting on quality assurance in biomedical neutron activation analysis; Vienna, Austria (13 Sep 1982).

Error sources typical for radiochemical processing in destructive neutron activation analysis of biomedical samples are discussed. Main aspects considered are: transfer of the irradiated sample from the irradiation container, addition of carrier, mineralization, chemical separation, determination of the chemical yield, calibration standards, blank correction, and contamination control.

31606 (IAEA-TECDOC—323, pp 163-177) **Gamma-ray spectroscopy in neutron activation analysis: sources of error.** Bruin, M. de (Interuniversitair Reactor Inst., Delft (Netherlands)). Nov 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780941. (CONF-8209272—Summ.).

From Advisory group meeting on quality assurance in biomedical neutron activation analysis; Vienna, Austria (13 Sep 1982).

The errors resulting from the gamma-ray spectrometric part of a neutron activation analysis may contribute considerably to the total analytical error. The major sources of these errors are discussed, including those associated with geometry, dead-time, summation and pile-up, detection and calculation of spectrum peaks and their assignment to specific radionuclides.

31607 (IAEA-TECDOC—323, pp 179-190) **Internal quality assurance in biomedical neutron activation analysis.** Heydorn, K. (Risoe National Lab., Roskilde (Denmark)). Nov 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780941. (CONF-8209272—Summ.).

From Advisory group meeting on quality assurance in biomedical neutron activation analysis; Vienna, Austria (13 Sep 1982).

In neutron activation analysis standard deviations of individual results are estimated from a priori precision and counting statistics, and sample heterogeneity is taken into account by a sampling constant. Statistical control means agreement between observed and estimated variability; additional sources of variation, including contamination during sampling, are detected by stepwise application of the Analysis of Precision.

31608 (IAEA-TECDOC—323, pp 191-201) **External quality control.** Bowen, H.J.M. (Reading Univ. (UK). Dept. of Chemistry). Nov 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780941. (CONF-8209272—Summ.).

From Advisory group meeting on quality assurance in biomedical neutron activation analysis; Vienna, Austria (13 Sep 1982).

Quality control of chemical analyses of biological materials is discussed, with especial reference to tests using certified biological reference materials.

31609 **(INIS-mf—9300) Kinetics of mass transfer on a drop bundle in the system uranyl nitrate nitric acid/tributyl phosphate, kerosene.** Schuster, U. (Technische Univ. Muenchen (Germany, F.R.). Fakultaet fuer Maschinenwesen). 2 Feb 1984. 286p. (In German). NTIS (US Sales Only), PC A13/MF A01. File Number DE85780931.

With 129 refs.

The dissertation discusses the kinetics of the coupled exchange of nitric acid and uranyl nitrate between water and tributylphosphate-burdened kerosene. Preliminary to column design, mass exchange measurements were carried out on a monodisperse droplet bundle according to a method not described so far. The concentration range investigated, i.e. $1x10^{-5} < UO_2(NO_3)_2 < 5x10^{-1}$ kmol/m^3, HNO_3 = 2,4 kmol/m^3, TBP = 30 Vol.% (TBP-Tributylphosphat), meets the technical standards. (orig.).

31614 **(INS-M—75) Rb-Sr system. Chemical procedures.** Graham, I.J. (Department of Scientific and Industrial Research, Lower Hutt (New Zealand). Inst. of Nuclear Sciences). Nov 1983. 53p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85701451.

This manual is intended to serve as a guide to the chemical procedures involved in Rb-Sr isotopic analysis as conducted at the Institute of Nuclear Sciences. Included are notes on the experimental developments made over the last 2.5 years, especially those involving rock dissolution and cation exchange chromatography.

31615 **(JINR—18-83-915) Optimization of measurement conditions at determining the nitrogen content in a grain using the gamma-activation method.** Zen Chan Uk; Zamyatnin, Yu.S.; Zhuchko, V.E. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions). 1983. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701027.

The yields of (γ, n) reactions on oxygen, nitrogen and carbon are determined experimentally at the irradiation of samples with bremsstrahlung of MT-22 microtron with 15.4 up to 21.3 MeV boundary energy. On the basis of these data optimum time for measurements of nitrogen activities and boundary energy of bremsstrahlung which provide best effect/background ratios and the least statistical error are determined. A technique is proposed for determining the nitrogen content with respect to carbon by means of successive registration of sample activity, which excludes sample weighting procedure. Optimum time momenta for measuring nitrogen and carbon activity are found.

31616 **(KFK—3868) Voltammetric assay of extremely low technetium concentrations following enrichment at the HMDE after reaction with Thiocyanate.** Friedrich, M.; Ruf, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Radiochemie; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Wiederaufarbeitung und Abfallbehandlung). Dec 1984. 16p. (In German). (PWA—103/84). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751643.

It is known that in sulfuric acid solution pertechnetate is reduced by thiocyanate to form thiocyanate complexes. After this reaction the technetium acquires the capability of being adsorbed at the hanging mercury drop electrode (HMDE) provided that a potential of -0,40 V (vs. Ag/AgCl) has been applied to the electrode. If, by application of the differential pulse voltammetry after the phase of deposition the potential at the electrode is scanned cathodically, traces of technetium can be determined very sensitively by evaluation of the peak current recorded at minus 1,27 V (Ag/AgCl). The effect is still being enhanced by the presence of not interfering small perrhenate amounts. The reproducibility of the measured values is excellent.

31617 **(N—85-17430) Comparative usefulness of flue gas oxygen and carbon dioxide analysis.** Horn, T. (British Gas Corp., London). 1984. 10p. British Library Lending Div., Boston Spa, England.

For the assessment of furnace equipment, the flue gas is usually examined. Flue gas losses and firing efficiency permit conclusions to be made about the excess of air. Oxygen concentration (O2 measurement) in the flue gas yields more information and is shown to be more precise than the determination of the carbon dioxide concentration (CO2 measurement).

31618 (NAC-AR—84-01, pp 193-196) **Report of the Van de Graaff Group: nuclear analysis. The search for molecular effects in range corrections in elemental determination by proton bombardment.** Olivier, O. (Stellenbosch Univ. (South Africa). Dept. of Chemistry); Peisach, M. 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE85780939.

In Annual report June 1984. [Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Center].

The proton bombardment of boron was studied in matrices consisting of a wide range of chemically pure boron compounds and mixtures of known composition. The gamma-ray spectrum of proton-irradiated pure boron showed intense peaks due to the 718 and 2124 keV coulomb excitation gamma-rays from ^{10}B and ^{11}B respectively and the 428 keV gamma-ray from the reaction $^{10}B(p,\alpha)^{7}Be$.

31619 (NAC-AR—84-01, pp 197-199) **Report of the Van de Graaff Group: nuclear analysis. Studies of South-West African interest.** Gihwala, D. (Department of Physical Sciences, Peninsula Technikon); Jacobson, L. (State Museum, Windhoek); Peisach, M.; Pineda, C.A. (Cape Provincial Administration). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE85780939.

In Annual report June 1984. [Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Center].

Clays and pottery from the Kavango and Caprivi areas of northern South West Africa were analysed for trace element concentrations. The main purpose of the investigation was to analyse clays from known sources and the pottery produced therefrom, in order to evalute the extent to which the elemental composition of a pot resembles that of the clay from which it was made. PIXE and PIPPS analysis were used. Analysis of clays from the northern regions of South West Africa indicated that the Kalahari: sands contained minor and trace elements of a suprisingly uniform composition.

31620 (NAC-AR—84-01, pp 201-202) **Report of the Van de Graaff Group: nuclear analysis. Studies on the origin of archaeological gold objects.** Jacobson, L. (State Museum, Windhoek); Gihwala, D. 31633 (NIM—1945) **Analyses of the NIMROC reference samples for minor and trace elements.** Steele, T.W.; Wilson, A.; Goudvis, R.; Ellis, P.J.; Radford, A.J. (National Inst. for Metallurgy, Johannesburg (South Africa)). 28 Feb 1978. 219p. NTIS (US Sales Only), PC A10/MF A01. File Number DE85701452.

The results are given of all the determinations made by the cooperating laboratories of minor and trace elements in the 6 NIMROC rock samples prepared by the National Institute for Metallurgy in 1966. Relevant statistical data and a graphical display of the distribution of the results are given for the sets of results for each element. Recommended values are given for those elements in which the number of results and their quality are reasonably acceptable. A description is given of the procedures that were used in the estimation of these recommended values. Methods used for the analysis includes: X-ray fluorescence analysis, solvent extraction, absorption spectroscopy, electrodeposition, emission spectroscopy, gravimetric analysis, mass spectroscopy, neutron activation analysis, chromatography, radiometric analysis, spectrophotometry, volumetric analysis, combustion, distillation, fusion, and ion exchange.

31634 (NRCN—532) **Spectrochemical determination of impurities in aluminium alloys by DC arc technique.** Harel, A.; Segal, A.; Charvit, E.; Goldbart, Z. (Israel Atomic Energy Commission, Beersheba. Nuclear Research Center-Negev). Apr 1983. 20p. (In Hebrew). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701453.

Two spectrochemical methods are described for the determination of 12 impurities in aluminium alloys. These methods are suitable for the determination of traces of the following elements in the range of 5-400 ppm: B, Cd, Cr, Cu, Mg, Mn, Ni, Pb, Sb, Sn, Ti, Zn.

31635 (SLU-ESO-TR—31-1983) **Methods of preserving leaf samples between defoliation and laboratory investigations.** Nilsson, L.O. (Swedish Univ. of Agricultural Sciences, Uppsala. Energy Forestry Project). 1983. 22p. (In English and Swedish). (EFP-TR—31-1983). NTIS (US Sales Only), PC A02/MF A01. File Number DE85750841.

A simple method to preserve leaf parameters between sampling and measurement is presented. Within one hour after artificial defoliation Salix leaves were killed by freezing. After storage at room temperature for 5 days inside closed plastic bags with a minimum of air, the changes in leaf area, dry weight and concentrations of N, P and K were relatively negligible. Because of respiration and stress, unfrozen leaves stored in the same way increased by 10 percent for concentrations of N, P and K whereas dry weight and area decreased by 10 and 5 percent, respectively. Shoots of Salix viminalis growing for one week as border stools, having better light conditions, increased their leaf-stem dry weight ratio in relation to shoots growing inside the plots. The increase was found to be about 10 percent as mean value from mid July to early October 1981.

31636 (UCRL—92731) **New directions in chemical analysis.** Hirschfeld, T.B. (Lawrence Livermore National Lab., CA (USA)). May 1985. Contract W-7405-ENG-48. 35p. (CONF-8504138—1). NTIS, PC A03/MF A01; GPO Dep. File Number DE85012930.

From IUCCP symposium; College Station, TX, USA (1 Apr 1985).

The last twenty years have seen a steady increase in the work load of analytical chemistry. A number of procedures have evolved in the analytical laboratory to deal with this increase in work load. By far, the most important one of these is the preponderance of lab automation. Because of the entrance of computers in the laboratories, we can achieve productivity increases that would have been inconceivable without them. The second new procedure that has evolved in analytical chemistry to cope with the work load increase has been the incorporation of systems engineering as a part of the analytical laboratory practice. This paper discusses in depth the role of personal computers and systems engineering in analytical chemistry.

31637 **(LA-tr—85-27) X-ray fluorescence analysis of uranium concentrates.** Diaz-Guerra, J.P.; Bayon, A.; Roca, M. (Los Alamos National Lab., NM (USA); Junta de Energia Nuclear, Madrid (Spain). Div de Quimica y Ambiente). May 1985. Contract W-7405-ENG-36. Translation of JEN-400, 1978. 28p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85013189.

Uranium concentrates were analyzed by x-ray fluorescence for the following impurities: arsenic, calcium, iron, molybdenum, phosphorus, silicon, sulfur, thorium, and vanadium. All of the impurities except arsenic can be determined simultaneously.

31638 **Optimization of detector-noise-limited infrared multiwavelength determinations.** Honigs, D.E.; Hieftje, G.M.; Hirschfeld, T. (Department of Chemistry, Indiana University, Bloomington, Indiana 47405 (D.E.H.,G.M.H.); and Lawrence Livermore National Laboratory, Livermore, California 94550 (T.H.)). *Applied Spectroscopy;* **39**: No. 2, 253-256(Mar 1985). Contract W-7405-ENG-48.

The existence of optimal absorbance levels for absorption spectrophotometry is well known. The corresponding phenomenon in the multi-wavelength measurements characteristic of correlation spectroscopy lends itself to a similar analysis. The resulting optimization equation is quite complex, but can be approximated for several simplified cases. For very similar absorbances among the set of used wavelengths, or for a situation where the absorbance multiplied by its weighting factor at a given wavelength is far greater than for all the others, the classical optimum at $A = 0.434$ still applies. For a uniform distribution of absorbance, the optimal maximum absorption is $A = 0.868$. The complex general case can be rearranged to calculate, given data at a given pathlength, what the optimum pathlength should be. In multiwavelength determinations, the optimal condition involves equal relative error in the largest and the smallest absorbance.

31639 **High-resolution self-scanning continuous wave dye laser.** Ramsey, J.M.; Whitten, W.B. (Oak Ridge National Lab., TN). *Analytical Chemistry;* **56**: No. 14, 2979-2981(Dec 1984). Contract AC05-84OR21400.

A continuous wave dye laser is coupled to an extracavity single-domain $BaTiO_3$ crystal which provides feedback that narrows the laser line width and the wavelength over a 25-nm range. It is shown that the laser keeps the narrow line width throughout the scan. The technique is demonstrated on the NaD lines produced in a hollow cathode lamp. The response is monitored by optogalvanic techniques. The spectra obtained are compared with those obtained from conventional mechanically tuned dye laser system. The resolution of the newly developed system is significantly enhanced over that of the existing systems.

31640 **Capillary supercritical fluid chromatography/mass spectrometry with electron impact ionization.** Smith, R.D.; Udseth, H.R.; Kalinoski, H.T. (Pacific Northwest Lab., Richland, WA). *Analytical Chemistry;* **56**: No. 14, 2971-2973(Dec 1984). Contract AC06-76RL01830.

A simple electron impact ionization source interface was developed for a combined capillary column supercritical fluid chromatography and mass spectrometry systems (SFC-MS). The sensitivity of the system was illustrated by the analysis of a sample containing 100 pg quantities of 4-aminobiphenyl, benzidine, and 3,3'-dichlorobenzidine. An analysis was also performed of the labile pesticide aldicarb. The latter analysis was performed additionally to determine the thermal effects of the chromatography. The total system was shown to enhance the flexibility of SFC-MS compared to standard liquid chromatography-mass spectrometry.

31641 **Cesium as an activatable tracer for studying biological intrusion of plant roots into waste burial areas.** Gladney, E.S.; Hakonson, T.E.; Muller, M. (Los Alamos National Lab., NM (USA)). *Journal of Radioanalytical and Nuclear Chemistry;* **84**: No. 2, 423-429(Nov 1984).

This paper discusses the use of stable Cs as an activatable tracer for measuring performance of plant root intrusion barriers for solid waste disposal site cover systems. Experiments conducted at small-scale demonstrate the effectiveness and practicality of the technique and suggest that the methodology has application to a better understanding of plant root ecology.

31642 **Systematics of multielement determination with resonance ionization mass spectrometry and thermal atomization.** Moore, L.J.; Fassett, J.D.; Travis, J.C. (National Bureau of Standards, Gaithersburg, MD). *Analytical Chemistry;* **56**: No. 14, 2770-2775(Nov 1984).

The systematics for multielement determination using resonance ionization mass spectrometry and thermal atomization is developed. The aspects of atomization, ionization, and detection are discussed and resonance ionization is demonstrated for 19 elements. The selective, sequential ionization of seven elements from a single sample is also demonstrated. A one-wavelength, two-photon ionization scheme generally is used in which the first photon excites a bound transition in the near-ultraviolet region and second photon promotes the electron into theionization continuum. The wavelength-dependence ion formation from the thermally produced atom reservoirs is demonstrated for these elements by scanning a Nd:YAG-pumped dye laser across its tunable wavelength range. The observed wavelengths where ionization occurs have been correlated where possible with allowed transitions between known electronic energy levels. The elements accessible by using four common dyes are tabulated. More than 20 elements are accessible within the wavelength range of each dye.

31643 **Microanalysis of reaction products in sealed tube wet air oxidations by capillary gas chromatography.** Conditt, M.K.; Sievers, R.E. (Univ. of Colorado, Boulder). *Analytical Chemistry;* **56**: No. 13, 2620-2622(Nov 1984).

Capillary gas chromatography can be used to analyze the reaction products of the oxidation of a compound in aqueous solution. A sealed glass capillary tube is used as the reaction vessel in which the compound and its products of oxidation are confined. The contents of the sealed tube are released upon crushing and are swept directly into the carrier gas stream of the gas chromatograph using a novel technique. As an example, the technique outlined in this paper is used to determine the combustion products of the wet air oxidation treatment of phenol; however, it may be used for any reaction in which volatile products are formed. A microanalysis technique is described which offers advantages over previously reported methods. The oxidation reaction at elevated pressure and temperature occurs in a sealed glass capillary tube and the reaction products are subsequently quantitatively introduced directly into a fused silica capillary column coated with a cross-linked polymer for gas chromatographic separation and analysis.

31644 **Characterization and comparison of vanadyl and nickel compounds in heavy crude petroleums and asphaltenes by reverse-phase and size-exclusion liquid chromatography/graphite furnace atomic absorption spectrometry.** Fish, R.H.; Komlenic, J.J.; Wines, B.K. (Univ. of California, Berkeley). *Analytical Chemistry;* **56**: No. 13, 2452-2460(Nov 1984). Contract AC03-76SF00098.

Vanadyl and nickel non-porphyrin rich fractions have been characterized in pyridine/water extracts of four heavy crude petroleums using reverse-phase high-performance liquid chromatography in combination with element-selective graphite furnace atomic absorption detection (RP-HPLC/GFAA). On the basis of rapid-scan UV-vis data indicating a lack of Soret absorbance associated with separated vanadyl and nickel containing fractions, we have categorized highly polar nickel compounds as non-porphyrin in Boscan, Cerro Negro, Wilmington, and Prudhoe Bay heavy crude petroleums. The presence of lower polarity vanadyl non-porphyrin compounds, occurring primarily in Wilmington and Prudhoe Bay petroleum, has also been confirmed. The vanadium histogrammic profiles, obtained using reverse-phase and size-exclusion HPLC/GFAA analysis for compounds extracted from the n-pentane (40:1) precipitated asphaltenes, were similar when compared to the pyridine/water extracts from the heavy crude petroleums.

31645 **Rapid and efficient capillary column supercritical fluid chromatography with mass spectrometric detection.** Smith, R.D.; Kalinoski, H.T.; Udseth, H.R.; Wright, B.W. (Pacific Northwest Lab., Richland, WA). *Analytical Chemistry;* **56**: No. 13, 2476-2480(Nov 1984). Contract AC06-76RL01830.

Capillary column supercritical fluid chromatography (SFC) using small diameter columns ($\sim$ 50 μm i.d.) has been demonstrated to provide efficient high-resolution separations. Microparticle packed column SFC has previously been demonstrated to allow very rapid moderate resolution separations, but the large pressure drop required by this approach does not allow effective pressure programming for fast separations to be obtained with capillary column SFC using high-pressure programming rates of up to 50 bar/min and provide advantages compared to packed column methods when the components to be separated span a wide molecular weight range. This approach complements the high-resolution capability of capillary SFC obtained using longer columns and provides increased sensitivity and narrow, nearly constant peak widths ($\leqq$ 6 s), which are ideally compatible with mass spectrometry (MS). Detection limits were found to be $\sim$ 0.1 pg for a series of biphenyl compounds using single ion monitoring. The application of capillary SFC/MS for both rapid and high-resolution separations is demonstrated for standard mixtures and a complex coal tar extract.

31646 **Development and preliminary evaluation of modified Savitzky-Golay smoothing functions.** Nevius, T.A.; Pardue, H.L. (Purdue Univ., West Lafayette, IN). *Analytical Chemistry;* **56**: No. 12, 2249-2251(Oct 1984). Contract AC02-79EV10240.

Modifications to the second-derivative terms of Savitzky-Golay digital filters are presented. The modified terms eliminate undesirable spectroscopic features. Neodymium solution and mercury pen light absorbance are examined using unmodified and modified digital filters. A significant reduction in high-frequency oscillatory behavior is found when using the modified function.

31647 **Spectrophotometric method for the determination of uranium in urine.** Kressin, I.K. (Los Alamos National Lab., NM). *Analytical Chemistry;* **56**: No. 12, 2269-2271(Oct 1984). Contract W-7405-ENG-36.

A method was developed in which 1 μg of uranium can be separated directly from 50 to 200 cm^3 of urine by anion exchange and then determined spectrophotometrically with arsenazo III.

31648 **Prediction of second and cross virial coefficients of blended mobile phases in gas chromatography.** Laub, R.J. (San Diego State Univ., CA). *Analytical Chemistry;* **56**: No. 12, 2110-2115(Oct 1984).

The second-interaction virial coefficients of vapors of potential interest as carriers in gas chromatography are considered in detail. Those examined include the monatomic gases helium, neon, argon, and krypton, the homonuclear diatomic compounds hydrogen, nitrogen, and oxygen, the heteronuclear inorganic species carbon monoxide, carbon dioxide, nitrous oxide, sulfur dioxide, water, hydrogen chloride, and ammonia, and the organic materials methane through n-pentane, carbon tetrachloride, and fluorotrichloromethane. Experimentally derived pure-component virial coefficients B/sub ii/ for all species except water and hydrogen chloride are shown to fit quadratic equations of the form (chosen so as to reflect the principle of corresponding states) B/sub ii//V/sub ii//sup c/ = f(T/sub ii//sup c//T), where the superscripts c indicate a critical value. The temperature range to which the temperature-invariant coefficients apply spans for all substances that for which accurate experimental data are available which, for many, is 200-950 K. Methods of prediction of the cross virial coefficient B/sub ii/ are detailed, and the results are then employed with B/sub ii/ for quantitative theoretical evaluation of the compositional variation of second-interaction virial coefficients B/sub M/.

31649 **Variation of gas chromatographic retentions with carrier pressure and composition.** Laub, R.J. (San Diego State Univ., CA). *Analytical Chemistry;* **56**: No. 12, 2115-2119(Oct 1984).

The second-interaction cross virial coefficients B/sub 1M/ are calculated for the solutes n-hexane, trans-3-hexene, benzene, 3,3-dimethylpentane, and cyclohexane with hydrogen, helium, nitrogen, carbon monoxide, carbon dioxide, argon, water, methane, ethane, carbon tetrachloride, and fluorotrichloromethane. The results are then used to evaluate the regression of In (solute specific retention volume) (V/sub g/π) with carrier pressure and composition, and it is shown theoretically as well as demonstrated experimentally that retentions as well as retention order can accordingly be altered. Plots of solute V/sub g/^{0} or of (V/sub g/π)$^{-1}$ against mole fraction of the fluoroalkane mobile phase in admixture with hydrogen are found to be curved, although the curvature is slight at column pressure drops of 1.1 atm and less. The linear variation of solute capacity factors K′ against partial pressure of steam + nitrogen as reported by Pretorius is thereby explained.

31650 **Secondary ion mass spectrometry of pyrene: enhancement of molecular ion emission by antimony trichloride.** Groenewold, G.S.; Todd, P.J.; Buchanan, M.V. (Oak Ridge National Lab., TN). *Analytical Chemistry;* **56**: No. 12, 2251-2253(Oct 1984). Contract AC05-84OR21400.

Antimony trichloride ($SbCl_3$) is used as a matrix to enhance the secondary emission of molecular pyrene ions. The behavior of the $SbCl_3$-pyrene system is investigated over the temperature range 21°C to 90°C. The results of the secondary ion mass spectrometric (SIMS) investigation are presented as a function of temperature. It is suggested that minor impurities in the $SbCl_3$ may aid in the oxidation of pyrene.

31651 **Nondestructive elemental analysis in three dimensions.** Borman, S.A. (Sandia National Labs., Albuquerque, NM). *Analytical Chemistry;* **56**: No. 1, 40(Jan 1984).

A new nuclear microprobe instrument for three-dimensional elemental analysis of solids has been developed. The instrument combines two techniques for three-dimensional analysis: Rutherford backscattering and elastic recoil detection. In the first case light ions impinge on heavy sample atoms and are scattered back to the detector. In the latter case heavy ions knock out light atoms that are then detected. The instrument is also equipped to perform proton induced x-ray analysis for trace element determinations.

31652 **Quantitative gas chromatography without analytic identification by ultrasonic detection.** Skogerboe, K.J.; Yeung, E.S. (Iowa State Univ., Ames). *Analytical Chemistry;* **56**: No. 14, 2684-2686(1984).

The response of the ultrasonic gas chromatographic detector is used to determine the absolute weight of an unknown analytic without a calibration curve. The method does not require that any physical properties of the analytic be known. The procedure for determining the weight concentration of an unknown requires that its response be measured in two carrier gases with different molecular weights but equal molar heat capacities, such as He and Kr. A detectability of 1 pg of hexane was found using He as the carrier gas.

31653 **Determination of pyrolyzable oxygen in ambient particulate matter.** Benner, W.H. (Lawrence Berkeley Lab., CA). *Analytical Chemistry;* **56**: No. 14, 2871-2875(1984). Contract AC03-76SF00098.

A technique is described for the determination of tens of micrograms of oxygen that can be pyrolyzed at T $<$ 1135°C. Standard oxygen-containing compounds and filter samples of ambient particulate matter are pyrolyzed in purified N_2, and oxygen in the pyrolysis products is quantitatively converted to CO by passage over carbon at 1135°C. The evolved CO is detected by NDIR (nondispersed infrared) spectrometry or by coulometry after conversion to CO_2. The application of the technique for the analysis of ambient particulate matter is shown.

31654 **Temperature-programmed evolved gas analysis for determining pyrolyzable oxygen.** Benner, W.H.; Hansen, A.D.A. (Univ. of California, Berkeley). *Analytical Chemistry;* **56**: No. 14, 2876-2879(1984). Contract AC03-76SF00098.

A temperature-programmed thermal analysis procedure is described for the characterization of oxygen in a sample. As a sample is pyrolyzed in N_2 to ~1100°C, oxygen in the gaseous decomposition products is converted to CO by passage over hot carbon. This CO is continuously measured with a NDIR (nondispersive infrared) detector. Recovery of oxygen in CO_2 and standard compounds was 100%. Thermograms of standard compounds, activated carbon, and ambient particulate matter show distinct features which demonstrate the potential applicability of this technique.

31655 **Aggregation and interactions of tributyl phosphate and tricaprylmethylammonium nitrate in hexane by osmometry.** Huang, C.H.; Bautista, R.G. (Iowa State Univ., Ames). *Separation Science and Technology;* **19**: No. 8-9, 515-529(1984). Contract W-7405-ENG-82.

The dimerization constant of tributyl phosphate in hexane has been determined by vapor pressure osmometry and was found to be in agreement with the values in the literature obtained by infrared spectroscopy. The tributyl phosphate-tricaprlymethylammonium nitrate extractants strongly associate with each other. The addition of varying concentrations of tricaprylmethylammonium nitrate to a constant concentration of tributyl phosphate results in a linear relationship of the average degree of aggregation of the mixture with the initial concentration of tricaprylmethylammonium nitrate. Varying the tributyl phosphate concentration results in a series of straight lines intersecting at one point. Extrapolation of the tributyl phosphate concentration to zero allows estimation of aggregation constants of tricaprylmethylammonium nitrate in hexane by the linear regression technique. 9 references, 5 figures, 6 tables.

31656 **(DOE/ER/13276—1) Characterization of catalysts with metal-support effects and of the species adsorbed on their surfaces. Progress report, September 1, 1984-August 30, 1985.** Vannice, M.A. (Pennsylvania State Univ., University Park (USA). Dept. of Chemical Engineering). 13 Jun 1985. Contract FG02-84ER13276. 13p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012254.

During the past year we have succeeded in modifying our DSC-2C calorimeter to greatly enhance its sensitivity and stabilize the baseline behavior. The details of the changes required have been given in a recent publication. As a result we have extensively studied the influence of crystallite size and the support on heats of adsorption of H_2, CO, and O_2 on Pt and Pd. Isothermal, integral heats of adsorption have been measured for H_2 and CO adsorption on Pt and Pd dispersed on four supports, SiO_2, Al_2O_3, TiO_2 and SiO_2-Al_2O_3. These values were determined at 215K and 300 to 320K. Results are presented. For supported Pt the heats of adsorption were highest on Pt/SiO_2 and lowest on Pt/TiO_2. However, a clear trend existed between heats of adsorption and Pt exposed with large Pt crystallites having the highest values. The Pd catalysts exhibited behavior different than those for the Pt catalysts in two major aspects. First the heats of adsorption values tended to increase somewhat as crystallite sizes became very small. Second, the high temperature reduction step did not decrease the heats of adsorption values as significantly for Pd/TiO_2. 4 refs., 5 figs., 3 tabs.

31657 **(DOE/FE/60339—T14) Structure-sensitive catalytic dehydrogenation of hydrogen donors over iron sulfides: new methods for increasing coal depolymerization under mild conditions. Final report, July 1, 1983-December 31, 1984.** Smith, G.V.; Phillips, J.B. (Southern Illinois Univ., Carbondale (USA)). Mar 1985. Contract FC22-83FE60339. 31p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85011969.

The objectives of this project were to examine the mechanisms of hydrogen sulfides in order to explore the conditions for enhancement of in situ hydrogen sulfide production in coal and to study the conditions for stabilizing iron sulfide structures under reaction conditions. A special technical objective was to apply multiplex gas chromatography to the project. It was shown that iron sulfides dissociate hydrogen and that hydrogen sulfide formation from iron sulfides occurs by way of a Langmuir-Hinschelwood-type mechanism. Moreover, the dissociation of hydrogen was found to be exceptionally catalyzed under certain conditions, but the catalysis is transitory. This transient enhanced catalytic activity (TECA) occurs during surface reconstruction of troilite as sulfur is removed but before the exposed iron atoms migrate into the bulk. A special modulator was developed for analysis of small molecules by multiplex gas chromatography. 7 refs., 10 figs., 3 tabs.

31658 **(LBL—19459) Photoelectron spectroscopic study of bonding in inorganic and organometallic compounds.** Beach, D.B. (Lawrence Berkeley Lab., CA (USA)). May 1985. Contract AC03-76SF00098. 163p. NTIS, PC A08/MF A01; GPO Dep. File Number DE85011975.

Thesis.

The gas-phase x-ray photoelectron spectra of boron trihalides, silyl amines, and thiazyl fluorides were obtained. It was found that the order of pi stabilization in the boron trihalides is $BF_3 > BCl_3 \geqq BBr_3 > BI_3$. The nitrogen lone-pair orbitals of trisilylamine and tris(trimethyl)silylamine were about 1 eV more stable than a hypothetical nonbonded nitrogen lone pair, indicating N p pi → Si d pi bonding. Sulfur d orbital participation is needed to rationalize the corrected ionization potentials of NSF and NSF_3. The charge distributions and atomic orbital character of NSF and NSF_3 were obtained. The same technique was used to study sigma and pi interactions in borane adducts of CO and $CNCH_3$, iron tetracarbonyl olefin complexes, and transition metal complexes of isocyanides. Borane to carbon monoxide pi bonding is important in BH_3CO, and the increase in C–O and C–N bond strength observed when BH_3CO and BH_3CNCH_3 form borane adducts is due to rehybridization of the sigma orbitals on carbon. The equatorially coordinated ethylene ligand of $Fe(CO)_4C_2H_4$ is a better pi acceptor of electron density from the equatorial metal orbitals than the CO ligand it replaced, but a poorer pi acceptor to the Fe d/sub xz/, d/sub yz/ orbitals. By comparing the bonding of $CNCH_3$ to CO in $Fe(CO)_4CNCH_3$, it was shown that $CNCH_3$ is a weaker sigma donor and pi acceptor than CO in this complex, and that filled pi orbital interactions are relatively more important for $CNCH_3$ than for CO.

31659 **(ORNL/TM—9649) System for the continuous generation of phosphorous aerosols from Red Phosphorus-Butyl Rubber. Final report.** Holmberg, R.W.; Moneyhun, J.H.; Gayle, T.M. (Oak Ridge National Lab., TN (USA)). Jun 1985. Contract AC05-84OR21400. 39p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85013527.

A system for the continuous generation of phosphoric acid aerosols from burning Red Phosphorus-Butyl Rubber (RPBR) is described. The system is primarily intended for inhalation toxicology experiments using high aerosol concentrations (ca. 0.3 to 3 g/m^3), but is adaptable to other studies where a time independent concentration of the aerosol is desired in a flowing system. The RPBR formulation is softened by addition of a small amount of hexane and extruded at a controlled rate at high pressure through an orifice. A precision hydraulic extrusion system using a micrometer adjustable high pressure hydraulic pump has been developed to control the extrusion rate. The emerging filament is ignited and burned in a flowing air stream for delivery to chambers. In addition to the extrusion-combustion system for aerosol generation, devices for recovering the spent aerosol and for monitoring its concentration are described. 2 refs., 18 figs.

31660 **Single atom surface diffusion of sulfur on Ni(111).** Kellogg, G.L. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Journal of Chemical Physics;* **83**: No. 2, 852-854(15 Jul 1985).

The surface diffusion of individual sulfur atoms on the Ni(111) plane has been investigated by field ion microscopy. The sulfur atoms were segregated to the surface by annealing the tip at

700 K. Surface diffusion on the (111) plane was detected at temperatures above 107 K with an activation energy of 0.29—0.30 eV. These results indicate a very high diffusion rate for sulfur on clean Ni(111) at typical reaction temperatures (e.g., 450—900 K for CO methanation).

31661 "Direct" calculation of quantum mechanical rate constants via path integral methods: Application to the reaction path Hamiltonian, with numerical test for the $H+H_2$ reaction in 3D. Yamashita, K.; Miller, W.H. (Department of Chemistry, University of California, and Materials and Molecular Research Division of the Lawrence Berkeley Laboratory, Berkeley, California 94720). *Journal of Chemical Physics;* **82**: No. 12, 5475-5484(15 Jun 1985).

The method recently proposed by Miller, Schwartz, and Tromp for determining Boltzmann rate constants "directly": by the path integral evaluation of a reactive flux correlation function: is developed within the framework of the reaction path Hamiltonian model for a general polyatomic reaction. The expression for the correlation function, the time integral of which is the rate constant, is reduced to a single path integral over only one degree of freedom (the reaction coordinate). Effects of tunneling, "frictional" effects on the reaction coordinate due to coupling to other degrees of freedom, and the effects of recrossing the transition state dividing surface are all correctly accounted for in the approach. Numerical tests of the formulas for the 3D version of the $H+H_2$ reaction (on the Porter—Karplus potential surface) gives excellent agreement with the (known) accurate results for this system.

31662 Kinetics of the reactions of NCO radicals with H_2 and NO using laser photolysis—laser induced fluorescence. Perry, R.A. (Combustion Research Facility, Sandia National Laboratories, Livermore, California 94550). *Journal of Chemical Physics;* **82**: No. 12, 5485-5488(15 Jun 1985).

Absolute rate constants for the reaction of NCO radicals with hydrogen (k_6; T = 592—913K) and nitric oxide (k_7;T = 294—538K) were measured using excimer laser photolysis-laser induced fluorescence at 416.8 nm. The following Arrhenius expressions summarize the data: $k_6 = 1.43 \times 10^{-11}$e/sup() -9000plus-or-minus1500/R/T $k_7 = 1.69 \times 10^{-11}$e/sup() 390plus-or-minus320/R/T cm^3 $molecule^{-1}$ s^{-1}. The experimental technique and results are discussed, and the importance of these reactions to combustion chemistry is addressed.

31663 Molecular dynamics study of the reaction H_2/OH→H_2O+H. Rashed, O.; Brown, N.J. (Applied Science Division, Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Journal of Chemical Physics;* **82**: No. 12, 5506-5518(15 Jun 1985).

Classical trajectory calculations have been performed to determine the influence of translational temperature, H_2 vibrational energy, H_2 rotational energy, OH vibrational energy, and OH rotational energy on the reaction $H_2+OH \rightarrow H_2O+H$. The potential energy surface was a modification of the Schatz—Elgersma analytical fit to the Walsh—Dunning surface. Reactivity increases with translational temperature, and is most strongly influenced by it. Rotational excitation of either or both molecules suppresses reactivity. Vibrational excitation of H_2 enhances reactivity, and vibrational excitation of OH has no effect. A thermal rate coefficient was computed for the reaction at 1200 and 2000 K. The computed value compares favorably with the experiment at 2000 K, while the agreement at 1200 K is less satisfactory. The agreement between theory and experiment at both temperatures indicates that the potential surface is a reasonable representation of the HHOH potential energy surface.

31664 Dynamics of atomic hydrogen and deuterium recombination on the stepped Pt(557) crystal surface. Lin, T.H.; Somorjai, G.A. (Univ. of California, Berkeley). *Journal of Physical Chemistry;* **89**: No. 1, 135-139(3 Jan 1985). Contract AC03-76SF00098.

The velocity distribution of HD produced on the Pt(557) crystal surface from atomic hydrogen and deuterium incident beams is measured in the temperature range of 150-700 K. The striking results are that (1) the average kinetic energy of the desorbing HD increases as the crystal temperature decreases from 300 to 200 K; (2) at 200 K, the velocity distribution is considerably wider than the Maxwellian distribution and there is a significant amount of HD leaving the surface with translational energy corresponding to 1900 K; (3) for a fraction of the incident atoms, the residence time decreases as the crystal temperature decreases from 300 to 200 K. It appears that some of the incident atoms can react with chemisorbed atoms at high coverage before they achieve thermal equilibrium with the surface. 21 references, 5 figures.

31665 Structure of potassium tetrakis(isothiocyanato)cobaltate(II) monohydrate nitromethane solvate, $K_2[Co(NCS)_4].H_2O.2CH_3NO_2$, at 120 K by neutron diffraction. Wood, J.S. (Massachusetts Univ., Amherst (USA)); McMullan, R.K. (Brookhaven National Lab., Upton, NY (USA)). *Acta Crystallographica, Section C: Crystal Structure Communications;* **40**: No. 11, 1803-1806(15 Nov 1984).

Msub(r) = 509.6, monoclinic, I2 (conventional C2), a = 11.098 (2), b = 5.227 (1), c = 16.496 (3) A, β = 100.06 (1)°, V = 942.2 (3) A^3, Z = 2, Dsub(x) = 1.796, Dsub(m) = 1.78 g cm^{-3}, lambda = 1.0470 (1) A, μ = 0.771 cm^{-1}, T = 120 K. Final $R(F^2)$ = 0.038 for 2011 observed reflections. The structure is built from chains of approximately tetrahedral $[Co(NCS)_4]^{2-}$ anions parallel to b and interconnected by O-H...S hydrogen bonds of length 3.377 (2) A. The potassium ions are linked by the nitromethane and water molecules to give double chains also parallel to b. Average bond distances in the anion are Co-N 1.964 (2), N-C 1.173 (1) and C-S 1.627 (2) A.

31666 Method for removing oxide contamination from silicon carbide powders. Brynestad, J.; Bamberger, C.E. (to Dept. of Energy). US Patent Application 6-636,658. 1 Aug 1984. 10p. Contract AC05-84OR21400.

The described invention is directed to a method for removing oxide contamination in the form of oxygen-containing compounds such as SiO_2 and B_2O_3 from a charge of finely divided silicon carbide. The silicon carbide charge is contacted with a stream of hydrogen fluoride mixed with an inert gas carrier such as argon at a temperature in the range of about 200° to 650°C. The oxides in the charge react with the heated hydrogen fluoride to form volatile gaseous fluorides such as SiF_4 and BF_3 which pass through the charge along with unreacted hydrogen fluoride and the carrier gas. Any residual gaseous reaction products and hydrogen fluoride remaining in the charge are removed by contacting the charge with the stream of inert gas which also cools the powder to room temperature. The removal of the oxygen contamination by practicing the present method provides silicon carbide powders with desirable pressing and sintering characteristics. 1 tab.

31667 (UCRL-Trans—12059) Graphite insertion compounds. Part III. Translated from *Bulletin de la Societe Chimique de France ;* No. 7-8, 1010-1011(Jul-Aug 1955). Contract W-7405-ENG-48. 6p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011801. DE85011801

Even though new insertion compounds of graphite are still being discovered, their number remains limited. These compounds can be classified as reversible or irreversible. The stability of insertion decreases from Cs to Na, and Li yields compounds that are different from those of the other alkali metals. It is shown that reversible insertion is due to metallic-type bonds and irreversible insertion to ionic-type bonds. Other metals than the alkali metals do not bond to graphite because their atomic radii are too small. (DLC)

31668 (BARC—1217) Synthesis of 2,2'-p-phenylene-bis-5-p-alkylphenyl oxazoles. Dhane, D.L.; Noras, K.A.; Mushrif, A.U. (Bhabha Atomic Research Centre, Bombay (India). Chemical Engineering Div.). 1984. 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85900983.

A convenient method has been described for the synthesis of 2, 2′-p-phenylene-bis-5-p-alkylphenyl oxazoles. This involves firstly the condensation of glycine with terepthaloyl chloride formed by the action of phosphorus pentachloride on terephthalic acid to give terephthaloyl diglycine which was then converted to its chloride. Terephtholyldiglycyl chloride was then used as an acylating agent in its reaction with ethylbenzene, toluene and benzene to give N,N′-substituted diamides which on dehydration gave 2,2′-p-phenylene-bis-5-p-alkylphenyl oxazole. One of the oxazoles viz 2,2′-p-phenylene-bis-5-pethylphenyl oxazole is hitherto unreported. Its nmr, ir and fluorescence spectrum have been recorded. 9 refs., 4 figs., 2 tabs.

31669 **(DOE/ER/10982—4) Prediction of thermodynamic properties of coal derivatives. Progress report, September 1, 1984-August 31, 1985.** Donohue, M.D. (Johns Hopkins Univ., Baltimore, MD (USA)). May 1985. Contract AC02-81ER10982. 24p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013147.

In this report, the progress of our efforts toward understanding mole. Tular behavior and its effect on thermodynamic properties is presented. An equation of state, the Perturbed-Anisotropic-Chain Theory (PACT), has been developed to treat fluids and fluid mixtures with various intermolecular interactions. These include Lennard-Jones interactions, anisotropic forces for dipolar and quadrupolar molecules, and hydrogen bonding interactions. Experiments also were performed for binary and ternary mixtures containing carbon dioxide and heavy aromatics. Our progress, both theoretical and experimental, is presented below in the following order: (1) prediction of properties for polymeric systems using PACT; (2) extension of PACT to treat hydrogen bonding systems for two cases: (a) pure-components and (b) binary mixtures of a hydrogen bonding molecule with an inert solvent (diluent); (3) reformulation of PACT to account for group-group interactions when several functional groups are present in one molecule; (4) simplification of the Perturbed-Hard-Chain Theory (PHCT) by replacing the cumbersome attractive term with an expression derived from the local composition model; and (5) experimental measurements for binary mixtures of carbon dioxide and heavy aromatics as well as enhancement of solubility of heavy aromatics in carbon dioxide by addition of a third component. 7 refs., 8 figs., 2 tabs.

31670 **(DOE/ER/10982—5) Thermodynamics of multipolar molecules: the perturbed-anisotropic-chain theory.** Vimalchand, P.; Donohue, M.D.; Celmins, I.C. (Johns Hopkins Univ., Baltimore, MD (USA). Dept. of Chemical Engineering). 1985. Contract AC02-81ER10982. 43p. (CONF-850417—22). NTIS, PC A03/MF A01; GPO Dep. File Number DE85013148.

From 189. national meeting of the American Chemical Society; Miami, FL, USA (28 Apr 1985).

The Perturbed-Hard-Chain theory (PHCT) is modified to treat rigorously dipolar and quadrupolar fluids and their mixtures. The multi-polar interactions, which are treated explicitly, are calculated by extending the perturbation expansion of Gubbins and Twu to chain molecules. Moreover, the square-well potential used to characterize the spherically symmetric interactions in the PHCT has been replaced by a soft-core (Leonard-Jones) potential. Theoretical claculations and data reduction on a number of pure fluids and mixtures indicate that the above changes result in physically more meaningful pure component parameters, and the properties of even highly non-ideal mixtures can be predicted accurately without the use of a binary interaction parameter. 18 refs, 14 figs., 3 tabs.

31671 **(DOE/RL/01830—T35) Separation of gas mixtures by supported complexes.** (Pacific Northwest Labs., Richland, WA (USA)). [1985]. Contract AC06-76RL01830. 8p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011996.

The objective of this program is to define the most advantageous materials (both complex and support), methods of material preparation, material properties, and the performance of feasible supported complex systems in applicable gas separations. 12 refs., 2 figs., 3 tabs.

31672 **(INIS-mf—9458) Performance of rare earth modified faujasites in the process of toluene disproportionation.** Azzouz, A.; Fourar, M.; Berrak, A. (Commissariat aux Energies Nouvelles, Algiers (Algeria). Centre de Developpement de Materiaux). Jun 1984. 8p. (In French). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701028.

The purpose of the present paper is the study of the performances of some catalysts based on y-type faujasite exchanged with La (3+) and Ce (3+) cations in the process of toluene disproportionation to benzene and xylenes. In the first stage the crystallographic study by the X-rays diffraction method shows that the cation exchange causes 311 plane displacements in the zeolite structure, accompanied by a decrease of diffraction limit intensity. Further the faujasite pretreatment with NH4 (4+) ions plays some role in the protection of the crystallinity. Moreover the cation exchange seems to take an optimum value around 73% for which the toluene conversion is maximum. This phenomenon is probably due to a decrease of the internal free volume for a pronounced cation exchange. The best performances are obtained by the zeolite that has undergone a slow and programmed thermal activation after cation exchange. This is probably due to the slowness of ion rearrangement phenomena, and of the catalytic surface restructuration. In the second stage the realization of toluene disproportionation process shows that the cation exchange with such elements confers to the faujasite an appreciable catalytic activity in the temperature range of 350-500 degC. The catalysts obtained permit about 20-60% toluene conversions. The catalytic activity is slightly higher in La-modified samples, whereas those containing Ce (3+) present relatively a better selectivity to the main process. Nevertheless, both types of catalysts show approximately a similar behaviour, favoring the p-xylene formation. The proportion of the latter exceeds that of thermodynamic equilibrium at temperatures less than 430 degC. The temperature increase affects this selectivity. This is probably due to dehydration phenomenon which are frequent around this value.

31673 **(IS-T—1144) Mechanistic study of the hydrodesulfurization of methanethiol over tungsten disulfide; a survey of rare earth sulfides for hydrodesulfurization activity.** Dowd, D.Q. (Ames Lab., IA (USA)). Jun 1985. Contract W-7405-ENG-82. 117p. NTIS, PC A06/MF A01; GPO Dep. File Number DE85011758.

Thesis.

Hydrodesulfurization is a process whereby sulfur bound in organic compounds is removed as hydrogen sulfide, and is important to the control of sulfur dioxide emissions in the combustion of petroleum and coal fuels. It involves the cleavage of carbon sulfur bonds, and is catalyzed by layered disulfides such as molybdenum and tungsten disulfide. The simplest example is the reaction $CH_3SH + H_2 \rightarrow CH_4 + H_2S$. The mechanism of even this protypical reaction is unclear. In an effort to clarify it, the kinetics of methanethiol hydrodesulfurization over tungsten disulfide at low pressures was established, with partial pressures of methanethiol and hydrogen varied over a hundred fold. The kinetic order in each reactant was positive when its partial pressure was low negative when its partial pressure was high. The negative order in hydrogen had not been previously seen. The product gases, methane and hydrogen sulfide, each exhibited negative kinetic orders at high partial pressures, zero kinetic orders at low partial pressures. A dual site Langmuir-Hinshelwood type mechanism, which defines one active site as two adjacent edge sulfur vacancies and the second as a neighboring sulfur atom, describes these results quite well. Seventeen rare earth sulfides were surveyed for catalytic activity toward methanethiol hydrodesulfurization. These sulfides included both stoichiometric and nonstoichiometric compositions and four different morphologies. In general, nonconductors were inactive and conductors were active. This correlation extended to the nonstoichiometric γ-phase sesquisulfides which exhibit both insulating and conducting properties. 96 refs.

31674 **(IS-T—1180) Formation of benzene by the pyrolysis of 4-vinylcyclohexene regiospecific formation of anthracenes in the pyrolysis of dibenzobuerones and related systems.** Tunkel, J.L. (Ames Lab., IA (USA)). Mar 1985. Contract W-7405-ENG-82. 211p. NTIS, PC A10/MF A01; GPO Dep. File Number DE85009225.

Thesis.

The thermal rearrangement of the dimer of butadient, 4-vinyl-cyclohexene, was investigated by flash vacuum pyrolysis (FVP). The FVP of 4-vinylcyclohexene-3,3,5,5,6,6,8,8-d_8 at 800°C gave benzene, which had a statistical deuterium incorporation, as a major product. From the results of the study, a new mechanism for the pathway from butadiene to benzene is proposed. Also described is a study on dibenzocyclooctene-5,5,6,6-d_4 and the isolation and characterization of the minor products produced along with anthracene in the FVP of 16. The FVP of 2,9-dimethyldibenzosuberone gives, as the sole product, 2,6-dimethylanthracene. The regiospecific transformation arises from a 180° ring flip of the two original aromatic nuclei relative to one another. The synthetic utility of this reaction was investigated, and it is a high yield, regiospecific route to difunctionalized anthracenes.

31675 (LBL—19444) **Transition-metal mediated formation and cleavage of carbon-hydrogen bonds: hydrogenolysis of trinuclear alkylidyne clusters and oxidative addition of carbon-hydrogen bonds to rhenium.** Seidler, P.F. (Lawrence Berkeley Lab., CA (USA)). Mar 1985. Contract AC03-76SF00098. 191p. NTIS, PC A09/MF A01; GPO Dep. File Number DE85012231.

Thesis.

Treatment of dicobalt alkyne complexes $Co_2(CO)_6(HCCR)$ (R = alkyl, aryl) with H_2 and $Co_2(CO)_8$ or $CpMo(CO)_3H$ leads to μ_3-alkylidyne complexes with molecular formula $Co_3(CO)_9CCH_2R$ and $CpMo(CO)_2Co_2(CO)_6CCH_2R$, respectively, in high yield and purity. Hydrogenation of these clusters occurs under mild conditions (60 to 90 °C, benzene solution, 3 to 4 atm of H_2) and gives olefins, paraffins, and carbonyl compounds. A radical pathway for the hydrogenolyses is suggested. ESR experiments involving the reaction of $Co_3(CO)_9CCH_2(CH_3)_3$ (2) with H_2 in the presence of the spin-trap t-BuNO confirm the intervention of vinyl radical intermediates and reveal that a hydrogen atom donor is generated. Evidence consistent with vinyl radical intermediates is also provided by isotope labelling. Inter- and intramolecular C-H oxidative addition reactions have been observed from two related organorhenium intermediates: $Cp^*Re(CO)(PMe_3)$ (11) and $Cp^*Re(PMe_3)_2c$ (12) (Cp^* = eta^5-$C_5(CH_3)_5$). The cyclometallated compounds undergo reductive elimination; the coordinatively unsaturated species thus formed can be trapped to give intermolecular C-H activation products under mild thermal conditions. In contrast to its (carbonyl)phosphine analog 11, 12 is capable of insertion into the C-H bonds of methane as well as cyclopropane and benzene. 100 refs., 20 figs., 1 tab.

31676 (ZfI-Mitt—77, pp 92-97) **^{15}N-amino acids syntheses.** Engelmann, H.; Dauert, A.; Niclas, H.; Lueneberger, H. (VEB Berlin-Chemie (German Democratic Republic)). Sep 1983. (In German). NTIS (US Sales Only), PC A14/MF A01. File Number DE85780083. (CONF-8305218—Summ.).

From Recent results of /sup 15/N tracer technique in medicine symposium; Rostock, German D.R. (29 May 1983).

4 syntheses of ^{15}N-amino acids are presented: (1) ammonolysis of α-halogenated acids with $H^{15}NO_3$, (2) hydrolysis of hydantoin derivatives using $^{15}NH_4HCO_3$, (3) synthesis with phthalimide-^{15}N potassium and (4) synthesis with acetamino-^{15}N diethyl malonate.

31677 **Neutron diffraction study of lithium hydrogen phthalate monohydrate: A material with two very short intramolecular OxxxHxxxO hydrogen bonds.** Kueppers, H.; Takusagawa, F.; Koetzle, T.F. (Mineralogisches Institut der Universitaet Kiel, Olshausenstrasse 40-60, D-2300 Kiel, Federal Republic of Germany). *Journal of Chemical Physics;* **82**: No. 12, 5636-5647(15 Jun 1985). Contract AC02-76CH00016.

The structure of lithium hydrogen phthalate monohydrate has been refined based upon neutron diffraction data obtained at three temperatures: 15, 100, and 298 K. All bond distances have been determined with precision better than 0.002 A. The two crystallographically independent hydrogen phthalate anions in the unit cell both possess very short intramolecular OxxxHxxxO hydrogen bonds with OxxxOroughly-equal2.4 A and angleOxxxHxxxOroughly-equal170°. One of these linkages is very decidedly asymmetric, with OxxxH = 1.122(1) A and HxxxO = 1.294(1) A at 15 K, reflecting the fact that the two O atoms have quite different environments in the crystal. The second OxxxHxxxO bond is more nearly symmetric, with OxxxH = 1.195(1) A and HxxxO = 1.205(1) A at 15 K, but the difference between the two distances is still significant. The asymmetry of the short hydrogen bonds appears somewhat more pronounced at 298 K than at the lower temperatures. A corresponding shift with temperature of the H atom in the short intramolecular hydrogen bond was found previously in 2,3-pyridinedicarboxylic acid, which has a molecular geometry similar to that found here.

31678 **Rotational reorientation dynamics at high pressures: rhodamine 6G in ethanol from 1 bar to 6 kbar.** Philips, L.A.; Webb, S.P.; Yeh, S.W.; Clark, J.H. (Univ. of California, Berkeley). *Journal of Physical Chemistry;* **89**: No. 1, 17-19(3 Jan 1985).

Picosecond, time-resolved fluorescence depolarization spectroscopy has been used to measure the rotational reorientation time (tau/sub or/) of electronically excited rhodamine 6G. When the dependence of tau/sub or/ on solvent viscosity for a series of linear alcohols is compared with that for ethanol as a function of pressure over the range from 1 bar to 6 kbar, substantially different rotational reorientation dynamics are found for identical macroscopic viscosities. 31 references, 2 figures, 2 tables.

31679 **Infrared multiphoton dissociation of octafluorocyclobutane with a two-frequency Q-switched CO_2 laser.** Pochon, E.; Weston, R.E. Jr.; Flynn, G.W. (Brookhaven National Lab., Upton, NY). *Journal of Physical Chemistry;* **89**: No. 1, 86-94(3 Jan 1985). Contract AC02-76CH00016;AC02-78ER04940.

The infrared multiphoton dissociation of octafluorocyclobutane has been investigated by the use of two CO_2 laser pulses of different frequency, synchronized by the same Q-switching mirror. The dissociation yield has been determined as a function of laser pulse energy, frequency of the dissociating pulse, substrate pressure, and interpulse delay. Accompanying transport phenomena (expansion and diffusion) were taken into account by the use of appropriate models. The kinetic behavior of highly vibrationally excited c-C_4F_8 molecules indicates that collisional relaxation occurs at nearly gas kinetic rates. 47 references, 10 figures.

31680 **Synthesis of aryl halides via organoborane chemistry.** Kabalka, G.W.; Sastry, K.A.R.; Sastry, U.; Somayaji, V. (Univ. of Tennessee, Knoxville). *Org Prep Proc Int;* **14**: 359-362(1982).

A method for the rapid synthesis of a variety of substituted aryl halides by the reaction of organoboranes with halide ions in the presence of chloramine-T is described in detail. The products were purified by column chromatography on silica gel using a mixture of petroleum ether-ethyl acetate as eluent.

From 6. DOE battery and electrochemical contractors' conference; Washington, DC, USA (25 Jun 1984).

31682 (DOE/ER/13247—1) **[Chemical probes of charge transfer at semiconductor/liquid junctions]. Technical report for May 15, 1984-January 15, 1985.** Koval, C.A. (Colorado Univ., Boulder (USA)). 1985. Contract FG02-84ER13247. 3p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013082.

A study of the effects of surface energetics and surface oxide layers on the cyclic voltametry of metallocenes at nonilluminated p- and n-InP electrodes has been completed. Nearly ideal semiconductor/solution interfaces can be prepared, it was concluded, and the voltammetry of metallocenes is a way to probe electron transfer across this interface under different surface energetic conditions. Single crystals of WSe_2 were grown by chemical vapor transport. A computer program was written to collect voltametric data and calculated convoluted currents, and it is used to examine the kinetics of charge transfer across the semiconductor solution interface. (LEW)

31683 **(LBL—19146) Experimental evaluation of the thermodynamic properties of concentrated aqueous potassium hyroxide solutions. Final report.** Johnson, W.B.; St. Pierre, G.R.; Macdonald, D.D.; Malhotra, M.K. (Ohio State Univ., Columbus (USA). Dept. of Metallurgical Engineering). Feb 1985. Contract AC03-76SF00098. 70p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85010628.

The thermodynamic activity of water in a binary KOH H_2O system has been measured using an electrochemical cell, Cell A [H_2(Pt)/KOH in H_2O/Hg, HgO(Pt)], in the concentration range between 1 and 8 molal and the temperature range of 0 to 80°C. From the equilibrium voltage of cell (A), the activity of water can be directly calculated without making assumptions about the degree of dissociation of the solute or any other solution parameters. The measured values of activity are greater than those found in previous vapor pressure studies, but are consistent with previous EMF measurements of KOH concentration cells at 25°C. These values are invariant with temperature for concentrations up to 4.0 molal but between 6.0 and 8.0 molal the H_2O activity first decreases by approximately 10% and then increases by ~ 15% as the temperature is increased. The general activity trend is consistent with, though smaller than, the results in the higher concentration ranges of the previous vapor pressure studies. The values of activity of water reported here can be used to refine previous calculations of Macdonald and coworkers (see LBL Final Report 4505110) on the theoretical efficiencies of alkaline battery systems. Since the measured activity values of water are within ~ 10% of those used in the previous calculations, the major conclusions of that study are not significantly affected.

31684 **Ion chemistry in silane dc discharges.** Chatham, H.; Gallagher, A. (Joint Institute for Laboratory Astrophysics, University of Colorado and National Bureau of Standards, Boulder, Colorado 80309). *Journal of Applied Physics;* **58**: No. 1, 159-169(1 Jul 1985).

The ion production and reactions in dc silane discharges are calculated. It is noted that almost all ion production and reaction occur in the cathode sheath region for typical low-pressure silicon-deposition discharges, so that the calculation considers ion production, drift, and reactions in the sheath region. Sheath models, for inert gas discharges, that utilize local and nonlocal electron energy distributions are compared, and one is adapted to silane conditions. The distribution of ion species (Si/sub l/H^+/sub m/) arriving at the cathode is calculated for a range of discharge pressures and currents, for comparison to mass spectrometer measurements. However, we do not make quantitative comparisons to reported observations due to sampling-bias issues that have not been taken into account.

31685 **(CBPF-NF—009/83) Photofragmentation of $Fe(CO)_5$. 1. Infrared and Moessbauer evidence for the formation of $Fe(CO)_4$ in polymer matrices.** De Paoli, M.A.; Oliveira, S.M. de; Saitovitch, E.M.B.; Guenzburger, D.J.R. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 19p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701417.

Pentacarbonyliron sorbed in low density polyethylene (LDPE) or polytetrafluorethylene (PTFE) and irradiated with ultraviolet light has been studied by infrared and Moessbauer spectroscopies. The main photofragment reacts with the residual pentacarbonyliron leading to the formation of $Fe_2(CO)_9$. This reaction, plus the information obtained from infrared and Moessbauer spectra, suggest that the new species could be assigned as tetracarbonyliron, $Fe(CO)_4$, and tricarbonyliron $Fe(CO)_3$. It is proved that molecules sorbed in a polymer matrix can be used as Moessbauer absorbers at low temperature. The polymer matrix allowed the isolation of otherwise unstable species: the high permeability of LDPE to gaseous carbon monoxide precludes the reformation of pentacarbonyliron molecules, thus excluding the 'cage effect' observed in frozen gas matrices.

31686 **(DOE/ER/10424—4) Electron photoejection in carbanions. Final report.** Tolbert, L.M. (Kentucky Univ., Lexington (USA). Dept. of Chemistry). 1984. Contract AS05-79ER10424. 20p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011748.

We have been investigating the photochemistry of resonance-stabilized carbanions. Photoexcited carbanions are very strong reductants, and such electron-transfer photosensitizers might find utility as models and, eventually, agents, for solar energy conversion devices. Our initial work has concentrated on evaluating the factors which control carbanion photochemistry and select among the various decay pathways such as isomerization or electron ejection. A ground state carbanion has a specific and well-defined space-charge relationship such that the negative charge is not evenly distributed, but rather is localized at certain atoms in the molecule. In the excited state, a new space-charge relationship exists, and the charge is redistributed to other atoms. It is this phenomenon which we believe dominates the photochemistry of such species and which provides a framework for this report of our work on carbanion photoreactivity. 22 refs.

31687 **(DOE/ER/10457—4-Rev.) Solar energy conversion in homogeneous solution. Final report, August 1, 1979-November 30, 1984. Revision.** Richman, R.M. (Carnegie-Mellon Univ., Pittsburgh, PA (USA). Dept. of Chemistry). 1984. Contract AC02-79ER10457. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85006883.

Several compounds of the form M-X-M, where M is a transition metal complex and X is a single atom bridge (O, N, or C) have been studied photochemically. The objective was the generation of high-energy species from radiation in the solar spectrum. $(FeTPP)_2O$, $(FeTPPC)_2O$, $(FeTPP)_2N$, and $(FeTPP)_2C$ photodisproportinate in solution to yield interesting high-oxidation state species, as demonstrated in continuous and flash photolysis studies. FeOTPP converts cyclohexene to 2-cyclohexene-1-one. FeOTPPC oxidizes amines in aqueous solution. FeNTPP is relatively unreactive, while FeCTPP reacts indistriminantly in all solvents tested. $[Ru(NH_3)_5]_2O^{4+}$ undergoes photosubstitution, with a solvent molecule replacing an ammonia ligand. These unsymmetrical products decompose to Ru(III) monomers. The results demonstrate that photodisproportionation is a significant new strategy for solar energy conversion. 7 refs.

31688 **(DOE/ER/13023—T1) Investigations on multiphoton ionization and laser-ion beam photodissociation spectroscopy. Progress report, September 1, 1982-August 31, 1985.** Russell, D.H. (Texas A and M Univ., College Station (USA). Dept. of Chemistry). 1985. Contract AS05-82ER13023. 18p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85009696.

The laser-ion beam photodissociation (LIBP) experiment is performed by intersecting a beam of ions with a high intensity laser beam and mass-analyzing the photofragment ions formed by dissociation of the photo-excited ions produced by absorption of a photon. Since the photo-excited ion is formed by a resonance photon absorption process, this experiment can be used to obtain information on the electronic structure of the ion, to study the occurrence of isomerization/rearrangement reactions of the gas phase ion, and the dynamics of unimolecular dissociation reactions. 6 refs., 2 figs.

31689 **P-aminobenzoic acid can sensitize the formation of pyrimidine dimers in DNA: direct chemical evidence.** Sutherland, J.C.; Griffin, K.P. (Brookhaven National Lab., Upton, NY (USA)). *Photochemistry and Photobiology;* **40**: No. 3, 391-394(Sep 1984).

Thymine-containing photoproducts with chromatographic properties similar to those of cyclobutyl pyrimidine dimers can be formed in [^{3}H]-thymine-labeled DNA in solution by 313 nm ultraviolet radiation in the presence of para-aminobenzoic acid (PABA), a compound used in sunscreen preparations. In the absence of PABA, similar fluences of 313 nm radiation do not produce significant numbers of these photoproducts. The thymine-containing photoproducts can be reversed by 254 nm radiation so that the tritium label migrates with the mobility of thymine monomer, a behavior characteristic of thymine-containing cyclobutyl pyrimidine dimers. This result supports previous, but less direct, data from other laboratories indicating that PABA can sensitize dimer formation in the DNA of bacterial and mammalian cells.

31693 (NUREG/CR—3514-Vol.2) **Chemical behavior of iodine in aqueous solutions up to 150°C. II. Radiation-redox conditions.** Toth, L.M.; Dodson, K.E. (Oak Ridge National Lab., TN (USA)). Mar 1985. Contract AC05-84OR21400. 22p. (ORNL/TM—8664/V2). NTIS, PC A02/MF A01 - GPO. File Number TI85010139.

Redox reactions that might alter the volatility of aqueous iodine solutions have been examined experimentally using absorption spectrophotometry. Oxygen and hydrogen atmospheres had no effect on the iodine chemistry at temperatures up to 150°C. However, irradiation of aqueous solutions with a ^{60}Co source, 0.8 x 10^6 R/h, produced radiolysis products that either oxidized iodide ion or reduced IO_3^- in the pH range 6 to 9 and generated significant amounts of volatile iodine. The amount of iodine volatilized varied from a few percent for solute concentrations of 10^{-4} M to as much as 10 to 19% for 10^{-6} M CsI or KIO_3 solutes. Silver metal has been shown to provide an effective gettering route for I^- in solution if these ions are first oxidized by .OH radicals generated during the radiolysis of the solutions.

31694 **Ionization of the hydroxycyclohexadienyl radical in concentrated KOH: a measure of the activity of OH^- in highly basic media.** Taniguchi, H.; Schuler, R.H. (Univ. of Notre Dame, IN). *Journal of Physical Chemistry;* **89**: No. 2, 335-338(17 Jan 1985).

The ESR spectrum of the hydroxycyclohexadienyl radical has been examined in aqueous solutions containing up to 10 M KOH. In strongly basic solution the radical exists, as a result of ionization of the OH proton, predominantly in an anionic form where the hyperfine constant of the C_6 proton ($a(H_6)$) is ~ 4 G greater than that of the neutral radical. The other ESR parameters are virtually unaffected by ionization. At pH values above 12, equilibration of the neutral and anionic forms is rapid. From the dependence observed up to 1 M OH^-, the pK/sub b/ deprotonation of this radical by the base is found to be -0.58 +/- 0.05. At higher base concentrations, $a(H_6)$ provides a good measure of the apparent activity of OH^-. While the present measurements indicate that the activity coefficient of OH^- in strong bases considerably exceeds one, the values obtained are substantially less than those given by the spectrophotometric measurements of Yagil using indoles as indicators. Implications of the differences noted on the significances of any given basicity scale are discussed. 13 references, 3 figures, 1 table.

31695 (CSIR-TSD—0009/83, pp 14) **Production of radio-isotopes.** Fourie, P.J. (Nuclear Development Corp. of South Africa (Pty.) Ltd., Pelindaba, Pretoria. Isotope Production Centre). Oct 1983. CSIR, P.O. Box 395, Pretoria, 0001, South Africa. (CONF-8310380—).

From Mini-seminar on non-destructive testing; Pretoria, South Africa (1 Oct 1983).

The Isotope Production Centre of the Nuclear Development Corporation of South Africa manufactures and markets a large number of important radio-isotopes for use in the medical, industrial and research fields. Radio-isotope production may be grouped in three major product classifications: unprocessed radioactive material; radiochemical preparations and sealed radiation sources. The production of ^{192}Ir radiography sources is discussed in greater detail. This also includes the post-irradiation handling and the sealing of ^{192}Ir sources into source capsules. Stringent tests for leakage are an essential feature of radioactive source production.

31696 (DOE/ER/60084—4) **Development of the osmium-191 → iridium-191m radionuclide generator. Annual report.** Treves, S.; Packard, A.B. (Children's Hospital Medical Center, Boston, MA (USA). Dept. of Radiology). 30 Apr 1985. Contract AC02-82ER60084. 44p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85011185.

The use of /sup 191m/Ir in radionuclide angiography has been the subject of increasing interest in recent years. The ^{191}Os-/sup 191m/Ir generator that has been used for these studies suffers, however, from low /sup 191m/Ir yield (10%/ml) and higher than desirable ^{191}Os breakthrough (5 x 10^{-3}%). We have recently developed a /sup 191m/Ir generator that has higher yield (25 to 30%/ml) and lower breakthrough (<5 x 10^{-4}%) when eluted with an eluent (0.001 M oxalic acid/0.9% saline) that does not require buffering prior to injection. Studies within the last year have shown the eluate of this generator to be non-toxic at up to 100 times the expected human dose and work is in progress to obtain approval for human use of this system. While a significant improvement over past generator designs, the yield of this generator is still modest and the evaluation of new osmium complexes for use on the generator has continued. Clinical studies involving the use of /sup 191m/Ir for first-pass angiography in adults and children have continued. A comparison of ejection fractions measured in adults with both /sup 99m/Tc and /sup 191m/Ir has confirmed the feasibilty of /sup 191m/Ir for radionuclide angiography in both the left and right ventricles of adults. Studies in collaboration with Baylor Medical College have demonstrated the efficacy of /sup 191m/Ir in combination with the multi-wire gamma camera. 31 refs., 2 figs., 10 tabs.

From 12. international hot atom chemistry symposium; Balatonfuered, Hungary (23 Sep 1984).

This proceedings contains the abstracts of 91 papers presented at the symposium. The majority of papers discusses various hot atom reactions and decay processes. A list of previous 11 international hot atom chemistry symposia from 1959 to 1982 is also given. One paper published in full length presents an overview of them (A.P. Wolf p. 89-89/b). (R.P.).

31710 (NUREG/CR—3293-Vol.1) **Technology, safety and costs of decommissioning reference nuclear fuel cycle and non-fuel cycle facilities following postulated accidents. Main report. Volume 1.** Elder, H.K. (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 327p. NTIS, PC A15/MF A01 - GPO. File Number TI85013021.

Technical requirements, costs and safety are conceptually evaluated for the post-accident cleanup and decommissioning of fuel cycle and non-fuel cycle facilities that have experienced a significant accident. Accident cleanup is postulated to include (1) initial decontamination of building surfaces to reduce the subsequent occupational dose to cleanup and decommissioning workers and (2) management of the resulting wastes. Decommissioning is assumed to follow accident cleanup. In order to ensure that worker doses are ALARA, despite higher radiation exposure to workers during post-accident operations, careful planning and rehearsal of cleanup operations and the use of remote and semi-remote cleaning techniques are required to reduce occupancy times in high-radiation areas and to minimize occupational exposures during accident cleanup. The public safety impacts of post-accident cleanup and decommissioning are also evaluated; these are below permissible radiation dose levels in unrestricted areas and well within the range of annual radiation doses from normal background.

31711 (NUREG/CR—3293-Vol.2) **Technology, safety and costs of decommissioning reference nuclear fuel cycle and non-fuel cycle facilities following postulated accidents. Appendices. Volume 2.** Elder, H.K. (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 298p. NTIS, PC A13/MF A01 - GPO. File Number TI85013022.

The following appendices are included in this volume: Reference Facility and Site Descriptions, Details of Reference Accident Scenarios and Resultant Contamination Levels, Generic Cleanup and Decommissioning Information, Details of MOX Plant Cleanup Decommissioning, Details of U-Fab Plant Cleanup and Decommissioning, Details of Non-Fuel Cycle Laboratory Cleanup and Decommissioning, Details of Ore Processing Site Cleanup and Decommissioning, Cost Estimating Bases, and Safety Assessment Details.

31712 (ORNL—6152, pp 76-92) **Chemistry of transuranium elements and compounds.** May 1985. NTIS, PC A10/MF A01. File Number DE85010586.

In Chemistry Division annual progress report for period ending January 31, 1985.

Studies are made in this program of high-pressure and of high-temperature properties of actinide metals and compounds. High-temperature synthetic work searching for new compounds of potential relevance for long-term storage of nuclear wastes is included as well as thermodynamic studies. Also, hydrides of the actinides are being investigated with particular emphasis placed on understanding the trend toward divalency shown at the heavy end of the actinide series (but not in the lanthanides). In other experiments, transuranium metals and compounds are placed under high pressure in order to force f orbital bonding and concomitant changes in structure which are analyzed by x-ray diffraction and by uv/vis spectroscopy. Studies of magnetic properties in metals and compounds determine experimental susceptibilities for comparison with theory as part of our focus on the characterization of 5f electrons in solids. Also a new focus is the investigation of the fundamental chemistry and physics of elements at the far reaches of the periodic table. Early emphasis will be on chemical properties of elements 101 to 105 as an indicator of the role of relativistic effects in controlling the architecture of the periodic table at the actinide-transactinide junction. This will involve "one-atom-at-a-time" chemical methodology including solvent extraction, ion exchange, electrochemistry, and volatility studies. 44 refs., 7 figs.

31713 **(UCAR—10062-83/1) Nuclear Chemistry Division annual report FY83.** Struble, G. (ed.). (Lawrence Livermore National Lab., CA (USA)). 1983. Contract W-7405-ENG-48. 255p. NTIS, PC A12/MF A01; 1; GPO Dep. File Number DE85012398.

The purpose of the annual reports of the Nuclear Chemistry Division is to provide a timely summary of research activities pursued by members of the Division during the preceding year. Throughout, details are kept to a minimum; readers desiring additional information are encouraged to read the referenced documents or contact the authors. The Introduction presents an overview of the Division's scientific and technical programs. Next is a section of short articles describing recent upgrades of the Division's major facilities, followed by sections highlighting scientific and technical advances. These are grouped under the following sections: nuclear explosives diagnostics; geochemistry and environmental sciences; safeguards technology and radiation effect; and supporting fundamental science. A brief overview introduces each section. Reports on research supported by a particular program are generally grouped together in the same section. The last section lists the scientific, administrative, and technical staff in the Division, along with visitors, consultants, and postdoctoral fellows. It also contains a list of recent publications and presentations. Some contributions to the annual report are classified and only their abstracts are included in this unclassified portion of the report (UCAR-10062-83/1); the full article appears in the classified portion (UCAR-10062-83/2).

31714 **Method for fluorination of actinide fluorides and oxyfluorides using O_2F_2.** Eller, P.G.; Malm, J.G.; Penneman, R.A. (to Dept. of Energy). US Patent Application 6-636,656. 1 Aug 1984. 9p. Contract W-7405-ENG-36.

The present invention relates generally to methods of fluorination and more particularly to the use of O_2F_2 for the preparation of actinide hexafluorides, and for the extraction of deposited actinides and fluorides and oxyfluorides thereof from reaction vessels. The experiments set forth hereinabove demonstrate that the room temperature or below use of O_2F_2 will be highly beneficial for the preparation of pure actinide hexafluorides from their respective tetrafluorides without traces of HF being present as occurs using other fluorinating agents: and decontamination of equipment previously exposed to actinides: e.g., walls, feed lines, etc.

31715 **Ion-molecule reactions and beam studies in relation to hot atom chemistry. Chapter 2-C.** Yoshihara, K. (Tohoku Univ., Sendai (Japan). Faculty of Science); Lee, Y.T. (California Univ., Berkeley (USA). Dept. of Chemistry; Lawrence Berkeley Lab., CA (USA)). pp 63-81 of Hot atom chemistry. Recent trends and applications in the physical and life sciences and technology. Matsuura, T. (Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy) (ed.). Amsterdam, Netherlands; Elsevier (1984).

Includes subject index.

In this paper, some aspects of hot atom chemistry in the gas phase are discussed in detail. First, ion-molecule reactions are studied in relation to tritium chemistry. Decomposition processes by nuclear decay and by charge-exchange reactions are compared. Next, the use of crossed molecular beams in hot atom chemistry is discussed. The $Br^+ + CH_3I$ and $Br^+ + CF_3I$ reactions are investigated in more detail.

31716 **(AD-A—150144/4/XAB) Coherent structures in turbulent flames. Final report.** Chigier, N.A. (Sheffield Univ. (UK). Dept. of Fuel Technology and Chemical Engineering). Oct 1983. 32p. NTIS, PC A03/MF A01.

The objective of this research was to obtain increased understanding of turbulent combustion in flows related to propulsion systems. Measurement and data-analysis techniques, and the boundary conditions of various flames were designed to provide improved concepts and fundamental experimental data, to aid the development of modelling techniques for practical combustion systems. The specific approach of the study was to quantify the roles of large eddies (coherent structures) in reacting flows. The experiments and measurement techniques developed to attain this aim were described in previous Interim Scientific Reports. Measurements described here were made in the initial region of gaseous jet flames with separate variation in Reynolds number and equivalence ratio. These measurements produced detailed data on the structure of the initial regions of jet diffusion flames, as a function of systematic variation of initial burner nozzle conditions. These data are of considerable use for combustion modelling. Two associated experiments investigating the structures of turbulent liquid fuel sprays and impinging flames were carried out during the period of the contract.

31717 **(AD-A—150478/6/XAB) Laser diagnostic analyses of sooting flames. Final report, 1 October 1980-30 September 1984.** Dobbs, G.M.; Eckbreth, A.C.; Boedeker, L.R. (United Technologies Research Center, East Hartford, CT (USA)). 29 Nov 1984. 50p. (UTRC/R—84-955388-F). NTIS, PC A03/MF A01.

Prepared in cooperation with Princeton Univ., NJ. Dept. of Mechanical and Aerospace Engineering.

Temperature distribution and soot particle-size distributions were measured in axisymmetric, laminar, diffusion flames in order to provide the basis for modelling the influence of fuel structure and temperature on soot formation. This document is the final report and management summary for the joint activities of UTRC and Princeton University. Coherent anti-Stokes Raman spectroscopy (CARS) was used for nonintrusive determination of temperature. Soot particle size and number densities were determined by Mie scattering. The experimental results were then applied to current models of soot formation in an effort to determine the physical and chemical basis for fuel structure and temperature effects on soot formation in diffusion flames. In the course of this first application of CARS and Mie diagnostics to diffusion flames, a large number of questions was raised in regard to the structure of particulate-laden diffusion flames. Measured distributions were compared with a numerical flame-sheet model.

31718 **(DOE/ER/13170—2) Coalescence/dispersion modeling of turbulent combustion in a jet stirred reactor.** Butler, G.W.; Pratt, D.T.; Malte, P.C. (Washington Univ., Seattle (USA). Dept. of Mechanical Engineering). 1984. Contract AT06-84ER13170. 21p. (CONF-8404104—5; WSS/CI—84-13). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011467.

From Spring meeting of the Combustion Institute; Boulder, CO, USA (2 Apr 1984).

In previous experimental studies of OH and O concentrations in high intensity turbulent combustion of methane in a jet-stirred reactor, a fully micromixed, perfectly stirred reactor (PSR) simulation model was shown to be inadequate for interpretation of the experimental results, due to the influence of finite-rate turbulent mixing near stoichiometric conditions. In the present work, a quantitative assessment of the interaction of finite-rate turbulent mixing and combustion chemistry is accomplished by means of a direct simulation using coalescence/dispersion modeling. A priori estimates of the reactor mixing frequency are compared with frequencies determined by empirically adjusting the coalescence/dispersion frequency to force agreement between measured and simulated profiles of mean temperature and species concentrations as a function of reactor equivalence ratio. The empirical values agree in order of magnitude with frequencies estimated either by consideration of global fluid dissipation length and time scales, or by characteristic reactor length and velocity scales. The simulations satisfactorily represent the measured temperature and species profiles over a wide range of equivalence ratios and, in direct contrast to the PSR predictions, show close agreement with the measured values near stoichiometric conditions. 15 refs., 7 figs.

31719 (LBL—18705) Soot and radiation in free boundary layer flames. Okoh, C.I. (Lawrence Berkeley Lab., CA (USA)). Dec 1984. Contract AC03-76SF00098. 137p. NTIS, PC A07/MF A01; 1; GPO Dep. File Number DE85013185.

Soot volume fraction data on six fuels [toluene, cyclohexene, iso-octane, cyclohexane, polymethyl-methacrylate, n-heptane] in free, radiating, boundary layer, diffusion flames are presented along with approximate particle concentrations and size distributions used, and a brief discussion of the optical method employed to obtain them. A mathematical model is also presented for these flames. The soot and gas temperatures are shown to be locked, allowing the soot radiation to be included in the gas energy equation. The conservation equations are nondimensionalized and solved. Average transport and radiative properties are specified for the sooting flames studied, and rules are established for obtaining these properties. The absorption coefficient is presented for all the fuels. The values are consistent with the initial assumptions that the boundary layers examined are optically thin. Solutions are obtained for the temperature, species, and velocity fields and comparisons are made with corrected experimental thermocouple measurements. Gas streamlines are calculated, and thermophoresis is included in particle trajectory determinations. Soot mass conservation and carbon conversion are studied in the boundary layers. Soot mass flow rates and net generation rates are obtained. The normalized soot generation rates exhibit similarity near the flame. A simple Arrhenius correlation is introduced for calculating net generation rates, and is found to sufficiently describe the temperature dependence of the soot growth over the temperature range $1700K < T < 2200K$. The energy parameter is of 0(50 kcal/mole) and the pre-exponential is of 0(10^{9}Hz). The Arrhenius forms are integrated along trajectories to obtain predicted soot concentrations which agree well with experiment. 171 refs., 17 figs., 6 tabs.

31720 (LBL—19583) Theoretical studies of molecular interactions. Lester, W.A. Jr. (Lawrence Berkeley Lab., CA (USA)). May 1985. Contract AC03-76SF00098. 6p. (CONF-850578—3). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012604.

From DOE/BES contractors' combustion meeting; Lake Geneva, WI, USA (22 May 1985).

The goal of this program is to extend fundamental knowledge of combustion processes by theoretical studies of the dynamics of energy transfer, reactive, and photodissociative processes. The approach is based on the reliable description of inter- and intramolecular interactions using ab initio methods and a variety of approaches to describe the dynamics of nuclear motion. A summary of recent results and future plans follows. 14 refs.

31721 (N—85-17088) Numerical calculation of the cold-flow characteristics of a bluff-body flame stabilizer. Ilegbusi, J.O.; Spalding, D.B. (Imperial Coll. of Science and Technology, London (UK)). Jul 1984. 27p. (CFD—84/14). NTIS, PC A03/MF A01.

The numerical prediction of turbulent flow behind a wedge-shaped flame stabilizer is described. The wedge is represented as a blockage in the flow. A model of turbulence characterized by the turbulence energy and a measure of the time-mean-square of the vorticity fluctuations is employed. The flow situations include cases with and without a nozzle upstream of the bluff body that simulates a lean-mixture combustor. Results based on these features are compared with the data for a 45 deg wedge angle. The predicted and measured size of the recirculation zone, mean velocity, pressure coefficients, shear stresses and turbulence energy are in fair agreement downstream of the stabilizer. (ESA)

31722 (N—85-17089) Two-fluid model of turbulence applied to combustion phenomena. Spalding, D.B. (Imperial Coll. of Science and Technology, London (UK)). Oct 1984. 56p. (CFD—84/15). NTIS, PC A04/MF A01.

Turbulent fluids are treated as random interspersions of two fluids, each possessing its own temperature, composition, velocity components, etc, and interacting through the sharing of space and the exchange of mass, momentum and energy. The model is applied to transient combustion of premixed fuel gas and air, partially confined in a duct. Research on two-dimensional steady flame phenomena is summarized. (ESA)

31723 (UCID—20385) Investigation of the flame speeds of propane/methanol gas mixtures. Foote, K.L.; Villareal, J. (Lawrence Livermore National Lab., CA (USA)). 2 May 1985. Contract W-7405-ENG-48. 16p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012817.

A series of tests was conducted in an acoustically tuned flame tube in order to determine the laminar burning velocities in air of various propane/methanol gas mixtures. The experimental method is explained in detail, along with the tabular results. A 90% propane, 10% methanol mixture is shown to have a maximum burning velocity of 40.8 cm/s. A 65% propane, 35% methanol mixture has a maximum velocity of 41.8 cm/s. These maximum flame speeds are shown to be about the same as that of pure propane by the same method. Gulder has found evidence that the presence of methanol in some hydrocarbon fuels may actually inhibit combustion, but we see no apparent modifications in the combustion of propane when mixed with methanol.

31724 Simultaneous two-dimensional mapping of species concentration and temperature in turbulent flames. Long, M.B.; Levin, P.S.; Fourguette, D.C. (Department of Mechanical Engineering and Center for Laser Diagnostics, Yale University, New Haven, Connecticut 06520). *Optics Letters;* **10**: No. 6, 267-269(Jun 1985).

A new technique has been developed that permits simultaneous two-dimensional mapping of two scalar components (e.g., species and temperature) in a turbulent reacting flow. The technique uses two optical multichannel analyzers, each of which detects light scattered by a different mechanism (e.g., Rayleigh and Raman) and thus provides different information. The technique has been applied to both premixed and nonpremixed flames, and results are reported for each. The simultaneous information obtained in these experiments should provide new data on the interaction of turbulence and combustion in these chemically reacting flows.

4201 General Engineering

31725 (UCRL—15669) Fiber-optics cable failure analysis. Scarton, H.A.; Spillers, W.R. (Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Civil Engineering). May 1984. Contract W-7405-ENG-48. 35p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012965.

The work reported is motivated by the mechanical failure of optical fibers in fiber optic cables used in underground testing at the Nevada Test Site. Focus is on basic mechanical tests, simulation of in-situ cable behavior, and proof tests. Preliminary flexure, creep, and tension test results are given together with both mechanical and optical instrumentation. (LEW)

31726 **(UCRL—88927) Applying molecular dynamics to fracture.** Hoover, W.G.; Moran, B. (California Univ., Davis (USA). Dept. of Applied Science; Lawrence Livermore National Lab., CA (USA)). Mar 1983. Contract W-7405-ENG-48. 13p. (CONF-830292—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012966.

From Joint Army Research Office/National Science Foundation workshop on fracture; Pasadena, CA, USA (16 Feb 1983).

An attempt has been made to understand the structure of rapidly moving cracks and to simulate their shadow patterns numerically. The particle trajectories are generated using molecular dynamics, and then shadow patterns are developed and compared with experimental results. By "molecular dynamics" is meant the solution of the microscopic atomistic equations of motion as relates to crack movement. The method is briefly outlined, as well as results and remaining difficulties. (LEW)

31727 **(AD-A—150319/2/XAB) Survey of the state-of-the-art of miniature cryocoolers for superconductive devices. Final report.** Smith, J.L.; Robinson, G.Y.; Iwasa, Y. (Naval Research Lab., Washington, DC (USA)). 31 Dec 1984. 63p. (NRL-MR—5490). NTIS, PC A04/MF A01.

This document presents the results of a survey of the state-of-the-art as applied to cryocoolers to cool small superconducting devices. The survey included visits to over 100 facilities involved in the production or development of small cryocoolers in the United States, Japan, Europe. Specifications of commercially available cryocoolers having capacities of one to five watts in the 80 to 4 K range are presented.

31728 **(AD-A—151112/0/XAB) Synthesis and characterization of superconducting electronic materials. Final technical report, 1 July 1982-30 September 1984.** Meservey, R.H.; Tedrow, P.M.; Orlando, T.P. (Massachusetts Inst. of Tech., Cambridge (USA). Francis Bitter National Magnet Lab.). 15 Nov 1984. 17p. NTIS, PC A02/MF A01.

Specialized vacuum deposition systems were developed with the necessary monitoring and control to synthesize or react refractory superconducting films. NbN, VN, NbTi, and VTi films of high quality were produced and their transport and tunneling properties studied. Ultra-thin films of pure Nb have been successfully made to study spin-orbit scattering in transition metals. The structural properties and penetration depth of NbN films prepared by reactive sputtering were studied. Many-body effects, important in superconductivity, were observed by spin-polarized tunneling and the antisymmetric Fermi liquid parameter was measured for the first time in Al. The technique of deconvoluting tunneling conductance curves to obtain the superconducting density of states has been improved. A comprehensive study was made of amorphous Ge tunnel barriers between superconductors.

31729 **(AD-A—151465/2/XAB) Stability and vibrations of internal windings of high-current superconducting solenoid magnets. Technical report.** Hara, K.; Moon, F.C. (Cornell Univ., Ithaca, NY (USA). Dept. of Structural Engineering). Dec 1984. 168p. NTIS, PC A08/MF A01.

High-field-solenoid magnets may experience internal damage or eventually collapse due to the powerful magnetic fields they produce. Elastic deformations of the conductor and insulation in these magnets deserve attention because they can cause local damage that can lead to electrical breakdown. In conventional stress analysis of cylindrically wound magnets, the magnetic field gradient, or magnetic stiffness, is usually neglected. However, in this thesis the magnetic stiffness is shown to have a significant effect on the elastic stability and vibration of these magnets. One-turn and multi-turn superconducting rings were used to study the effects of deformations on stability and vibration. Both static and dynamic methods were used to determine the critical buckling currents. The dispersion of natural frequencies with increase in current and subsequent in-plane and out-of-plane buckling of the rings near the critical buckling current were observed. A model based on ring theory and magnetic stiffness was developed to explain experimental observations and showed a fair to good agreement between experimental and theoretical values of the buckling current. This model was used to evaluate the buckling current of 7- and 10-turn magnets. The analysis showed buckling concentrated in the outer turns.

31730 **(AD-A—954082/4/XAB) Night-work lighting systems for construction equipment. Interim report No. 1.** Cashell, C.F. (Engineer Board, Fort Belvoir, VA (USA)). 24 May 1946. 141p. NTIS, PC A07/MF A01.

This U/A report covers a study of the lighting requirements to permit efficient night operation of the power cranes, road graders, road rollers, tractors, tractor-operated cranes, water distributors, and ditching machines used by the Corps of Engineers; describes the development of suitable lighting and electrical power equipment; and sets forth data on the proper location of the equipment in order to meet lighting requirements. After development of suitable lighting equipment, the determination of the type, number, and optimum location of the lighting fixtures required for each item of construction equipment was made in the field in a long series of night operations with skilled operators obtained from the Engineer School, including expert instructors from the training courses of that organization and men with long records of service in civilian construction and military construction in the theaters of operation. Included in the report are specifications covering all materials and parts required for the lighting systems developed.

31731 **(CAPE—2945) In-cell welding fixture. Remote welder assembly, Model II (Engineering Materials).** (Oak Ridge National Lab., TN (USA)). 1 Feb 1985. Contract AC05-84OR21400. H. File Number TI85011048.

7 35-mm aperture cards.

The remote welder assembly provides the mechanical apparatus for remotely welding cylindrical, metallic capsules containing radioactive materials. It consists of a rotating chuck and welding electrode with positioning controls operable by master-slave manipulators.

31732 **(CEA-CONF—7349) High magnetic field and very low temperature cryomagnet for neutron scattering experiments.** Rossat-Mignod, J.; Olivier, J.; Burlet, P. (CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France)). Feb 1984. 20p. (CONF-840263—3). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751303.

From Workshop on sample environments in neutron and x-ray experiments; Grenoble, France (13 Feb 1984).

A cryomagnetic system is described in which the main components are a cryostat providing variable temperatures and a superconducting magnet. The cryostat enables the magnet to operate either at 4.2 K or 2.17 K and the sample temperature to be varied from 1.5 K to 300 K. The magnet is a split coil providing a vertical magnetic field of 8.7 T at 4.2 K and 10 T at 2.17 K. A ^{3}He - ^{4}He dilution refrigerator insert can be used to reach T=50 mK. A few significative experimental results are presented concerning UAs, CeSb, CeB$_6$ and TMMC.

31733 **(CEA-CONF—7386) Composition modulation measurements in thin 2D-superconducting multilayers.** Villegier, J.C.; Blanchard, B.; Laborde, O. . (CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France)). Aug 1984. 3p. (CONF-840842—32). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751300.

From 17. international conference on low temperature physics; Karlsruhe, F.R. Germany (15 Aug 1984).

Superconductive and resistive properties of Nb-Al coherent multilayers are measured in the case of a small number of 6 nm thick layers. A strong anisotropy of critical fields (Hsub(parallel)/Hsub(perpendicular)) > 2.1) and a low Hsub(parallel) approximately (T-Tsub(c)) (near Tsub(c)) are observed indicating a complex 2D-superconducting behavior. A direct observation of the composition modulation is developed associating a selective "layer by layer" etching technique with structure and SIMS depth profiling analysis.

31734 **(CEA-CONF—7441) Thermal cycling machine for cryoelectronic devices characterization.** Locatelli, M.; Desmaris, M.; Villegier, J.C. (CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France)). 1984. 3p. (CONF-840705—8). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751595.

From 10. international conference on cryogenic engineering; Espoo, Finland (31 Jul 1984).

We present the main characteristics of a full automatic machine for thermal cycling of cryoelectronic devices between 4.2 K and an annealing temperature below 350 K. This machine has been used for cycling NbN-oxide-Pb(In)Josephson devices for more than 800 times without any significant parameters change.

31735 **(CEA-CONF—7442) Automatic point testing machine at 78 K.** Lagnier, R.; Bedin, E.; Tribolet, P. (CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France)). 1984. 3p. (CONF-840705—7). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751594.

From 10. international conference on cryogenic engineering; Espoo, Finland (31 Jul 1984).

We describe an automatic point probe apparatus, that allows electrical testing of cryoelectronic devices at 78 K. The measurements are done by automatic displacement and positioning of the contact pin on the 1 in. diameter sample. The number of tests on each device, usually about 2000, is done in the shortest possible time.

31736 **(CEA-CONF—7443) Dynamic cooling system for cryogenics sensors.** Locatelli, M.; Chiron, C.; Pocachard, J. (CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France)). 1984. 4p. (CONF-840705—6). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751593.

From 10. international conference on cryogenic engineering; Espoo, Finland (31 Jul 1984).

We propose a dynamic cooling system which compared to the static method presents the following advantages: low cost, low cryogenic liquid consumption (helium), large ability for different experiments and easy to use for the non specialists.

31737 **(DP-MS—85-31) What is validation.** Clark, H.K. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1985. Contract AC09-76SR00001. 23p. (CONF-850917—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011508.

From Topical meeting on criticality safety and the storage of fissile material; Jackson, WY, USA (9 Sep 1985).

Criteria for establishing the validity of a computational method to be used in assessing nuclear criticality safety, as set forth in "American Standard for Nuclear Criticality Safety in Operations with Fissionable Materials Outside Reactors," ANSI/ANS-8.1-1983, are examined and discussed. Application of the criteria is illustrated by describing the procedures followed in deriving subcritical limits that have been incorporated in the Standard.

31738 **(JAERI-M—84-020) Shielding experiments for evaluating a shielding safety evaluation code system to spent fuel processing facilities, (4). Experiments for the assessment on source geometry of BWR spent fuel assemblies.** Tanaka, Shun-ichi; Sakamoto, Yukio; Yamaji, Akio. (Japan Atomic Energy Research Inst., Tokyo). Feb 1984. 50p. (In Japanese). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701056.

Shielding experiments of a spent fuel transport cask were performed using two BWR spent fuel assemblies according to the experimental plan to confirm the reliability of a shielding safety evaluation code system and data libraries. The experiment was made using two BWR spent fuel assemblies with a same burnup and cooling history. The distributions of gamma-ray dose rate and ^{235}U and ^{232}Th fission rates were measured around each assembly and two assemblies. The maxima of gamma-ray exposure dose rate and ^{235}U fission rate were observed at about one to third of fuel length from the bottom. The intensities above the position were decreased along the upper direction, where the fission rate was more steeply than the gamma-ray dose rate. This report gives the data of the experimental conditions and the detector characteristics necessary for the analysis of the experiments as well as the measured data.

31739 **(JINR—8-84-165) Thermodynamic analysis and optimization of cryogenic helium systems with satellite refrigerators.** Agapov, N.N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1984. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701001.

Optimal power mode cryogenic helium systems with satellite refrigerators have been calculated to refrigerate superconducting magnetic systems of accelerators. Information is presented on specific power compressed gas and liquid helium comsumptions for refrigeration in the satellite. The flow-diagrams of satellite refrigerators with an expansion engine, single and intermediate throttling are analysed. A comparison of different flow-diagrams is made for the same surface of heat exchangers of the satellite refrigerators. An optimal value of this heat exchange surface is determined. It is considered how the necessity of helium circulation in a cryogenic device affects parameters of the satellite refrigerators (for two-phase helium). The use of an ejector in a satellite refrigerator allows the vapour content of two-phase helium to be reduced significantly at the output of the cryogenic device without excessive power consumption unavoidable in single circulation flow-diagrams.

31740 **(KFK—3857) Plating-out of droplets and particles with diameter from 1-9 μm in horizontal pipes and in 90° pipe bends.** Furrer, J.; Dillmann, H.G.; Linek, A. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Lab. fuer Aerosolphysik und Filtertechnik 2; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Wiederaufarbeitung und Abfallbehandlung). Dec 1984. 21p. (In German). (PWA—104/84). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751621.

This report presents the types of calculation as well as the results as diagrams which can be used as a basis for estimating plating out of aerosols in horizontal pipeworks and in 90° pipe bends. The calculations were carried out to comply with many inquiries concerning this problem addressed by industry and research institutions.

31741 **(LA—10367-MS) Enhanced heat transfer computations for internally cooled cable superconductor.** Rogers, J.D. (Los Alamos National Lab., NM (USA)). Mar 1985. Contract W-7405-ENG-36. 9p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011897.

Superconducting magnets are built with conductors that are pool bath cooled, internally cooled with the superconductor cabled and contained within a conduit, or conduction cooled. The first two embody superconductors in direct contact with liquid helium. Practical designs of internally cooled cable superconductor (ICCS) are not cryostable. Such superconductors have shown multiple regions of stability and instability. A computational method of adjusting the heat transfer coefficient of a one dimensional system of equations to enhance joule heat removal, primarily in the central region of a pulse heated model of ICCS, has been used to attempt simulation of the multiple stability/instability experiment.

31742 **(LA-UR—85-1149) Pulsed hydrojet propulsion.** Bohachevsky, I.O.; Torrey, M.D. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 29p. (CONF-850712—4). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85010771.

From 21. AIAA/ASME/SAE joint propulsion conference; Monterey, CA, USA (8 Jul 1985).

The pulsed hydrojet is a device in which the water ingested from the free stream is accelerated out of the exhaust pipe to produce thrust. In this report we describe and analyze a way of accelerating the stream of water with pockets of high pressure steam and gas generated inside the stream by an exothermal reaction of suitable propellant injected and dispersed in the water. The velocity increment that must be imparted to the water to produce a substantial thrust need not be very large because the density of the water is comparable to the average density of the accelerated body. Results of the numerical modeling of the proposed jet acceleration mechanism indicate that the hydrojet propulsion device is potentially capable of propelling underwater projectiles at speeds three to five times greater than those currently attainable. Several promising applications of the hydrojet thruster are discussed and evaluated.

31743 (N—85-16180) **Clearance flow-generated transverse forces at the rotors of thermal turbomachines.** Urlichs, K. (National Aeronautics and Space Administration, Washington, DC (USA)). Oct 1983. 181p. (NASA-TM—77292). NTIS, PC A09/MF A01.

Self-excited rotor whirl represents a serious hazard in the operation of turbomachines. The reported investigation has, therefore, the objective to measure the lateral forces acting on the rotor and to determine the characteristic pressure distribution in the rotor clearance area. A description is presented of an approach for calculating the leakage flow in the case of an eccentric rotor position on the basis of empirical loss coefficients. The results are reported of an experimental investigation with a turbine stage, taking into account a variation of the clearance characteristics. The pressure data measured are consistent with the theoretical considerations. G.R. (IAA)

31744 (NUREG/CR—0200-Vol.1, pp vp, Section S2) **SAS2: a coupled one-dimensional depletion and shielding analysis code.** Hermann, O.W. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007563. (ORNL/NUREG/CSD—2/Vol.1).

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 1. Control modules.

The SAS2 control module computes gamma and neutron dose rates at distances from a specified shipping cask, containing fuel assemblies of a given reactor history and cooling time. Time-dependent cross sections for the reactor characteristics are computed from one-dimensional transport neutronics modules, which account for resonance self-shielding. A matrix exponential expansion model computes time-dependent material densities applied in the cross-section production and the shipping cask analysis. Functional modules of the SCALE system activated by SAS2 are: BONAMI-S, NITAWL-S, XSDRNPM-S, COUPLE, ORIGEN-S, and XSDOSE. The document presents input requirements, computational procedures, applications and uncertainties, subroutine descriptions, and sample problems.

31745 (NUREG/CR—0200-Vol.1, pp vp, Section H1) **HTAS1: a two-dimensional heat transfer analysis of fuel casks.** Turner, W.D.; Cobb, C.K. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007563. (ORNL/NUREG/CSD—2/Vol.1).

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 1. Control modules.

The Heat Transfer Analysis Sequence Number One (HTAS1) control module was developed for the United States Nuclear Regulatory Commission to perform standardized thermal analyses on a class of nuclear fuel shipping containers. HTAS1, a control module in the SCALE system where SCALE is an acronym for Standardized Computer Analyses for Licensing Evaluation, uses the HEATING6 functional module to perform the prescribed thermal analysis. The nuclear fuel shipping container must be composed of acceptable combinations of zones consisting of a cavity, an inner shell shielding, an outer shell, a neutron shield, a water jacket, and impact limiters. Thermal properties for the material in each zone may be extracted from a material property library or may be supplied by the user. The desired thermal analysis of the nuclear fuel shipping container is defined by an analytical sequence composed of one or more of the following calculations chosen in an acceptable order: an initial steady state; a prefire steady state; a fire transient; a postfire transient; and a final steady state. Each calculation in an analytical sequence specifies the type (steady state or transient), the ambient temperature, the duration of any transient, and the heat transfer mechanisms at the surface of the model. Selected portions of the model may be deleted at certain points in an analytical sequence to simulate changes in the nuclear fuel shipping container during an analysis. The model and analytical sequence are described to HTAS1 using free-form, keyword-oriented data making extensive use of defaults.

31746 (NUREG/CR—0200-Vol.2, pp vp, Section F12) **JUNEBUG-II: a three-dimensional geometry plotting code.** Emmett, M.B.; Petrie, L.M.; West, J.T. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007576. (ORNL/NUREG/CSD—2/Vol.2).

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 2. Functional modules.

The JUNEBUG-II code is an exceptionally valuable tool which is used to verify and validate three-dimensional (3-D) combinatorial geometry and KENO geometry models. It uses the MARS geometry system for modeling complicated multiple array lattices as well as simple combinatorial geometry models. Input for JUNEBUG-II is very flexible and will accept standard KENO-IV input data, as well as combinatorial MARS geometry input. JUNEBUG-II is an improved version of JUNEBUG which has been updated to provide faster running times and more efficient storage allocation. Variable I/O units are now used, a new and more efficient COMMON structure has been developed, and program errors detected by users have been eliminated. Subsections are introduction, input, program flow, subroutine description, and sample problems.

31747 (PEL—284) **Computer modelling of the flow of air and aerosols through and onto porous filters, and some applications and modifications of the Parker model.** Rossouw, J.W.; Leuschner, A.H. (Nuclear Development Corp. of South Africa (Pty.) Ltd., Pelindaba, Pretoria). Feb 1984. 20p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701484.

A brief overview of a theoretical model for the movement of aerosol particles through a pore in a filter is given. The aim of the report is to describe the calculation methods involved in the theoretical determination of the impaction efficiency of a Nuclepore filter, consisting of cylindrical holes. The Navier-Stokes equations, derived from a continuum mechanics in terms of a stream function Y and a vorticity vector w, have been used to describe the flow through a cylindrical pore. These equations were solved numerically and the results used to obtain the air velocity at a discrete grid of spatial points. By assuming that Stokes drag force acts on a particle moving with the air towards the pore, a particle trajectory has been calculated. Thus it could be determined wether a particle has deposited on the filter or has passed through the pore in the filter. The interception and impaction efficiencies for subsequent particles after a single particle deposition, have also been investigated.

31748 (SAND—85-0173C) **Testbed for sensory control of intelligent machines.** Donohoe, G.W. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 13p. (CONF-8505122—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012355.

From EPES '85 - energy, power and environmental systems international conference; Santa Barbara, CA, USA (29 May 1985).

The Intelligent Machine Systems Division of Sandia National Laboratories is engaged in the development of the sensory control of robots to perform human-like tasks in hostile environments, such as the remote maintenance of a nuclear reactor. Such a robot should be able to operate in a relatively unstructured environment. It should be able to monitor the progress of a task, verifying that things are proceeding as planned. If they are not, the robot should be able to detect this and take corrective action. In collaboration with the University of New Mexico, the laboratory has constructed a sensor-driven robot testbed for exploring these issues.

31749 (STEV-SB—83-36) **Tests of loading techniques for biomass, in particular tree stumps.** Goetblad, R. (Statens Energiverk, Stockholm (Sweden)). 1983. 39p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. File Number DE85750865.

In this project, efficient techniques for loading wood wastes, in particular stumps, has been developed. It was found that a combination vehicle, to be used for stump extraction, loading and ditching was more cost effective than a special machine. Such a combination vehicle was developed from a Aakerman H12B excavator, and was tested during four months under shifting conditions and using all its equipment.

31750 **(UCRL—15661) Processing and problems in manufacturing MJR billets of four separate compositions for Lawrence Livermore National Laboratory.** McDonald, W.; Smathers, D.B.; O'Larey, P.M.; Siddall, M. (Teledyne-Wah Chang, Albany, OR (USA)). 28 Jan 1985. Contract W-7405-ENG-48. 15p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012978.

Four separate compositions of superconducting composites (Nb/bronze) were produced, drawn to 0.9 mm dia and containing 2.9:1 volume ratio of bronze to niobium. Critical current density was measured for each heat treatment. Some of the bronze used also contained 0.25 wt % titanium. 2 figs., 6 tabs. (DLC)

31751 **(UCRL—92050) Field measurement of tension in a T-142 tank track.** Trusty, R.M.; Wilt, M.D.; Carter, G.W.; Lesuer, D.R. (Lawrence Livermore National Lab., CA (USA)). Apr 1985. Contract W-7405-ENG-48. 11p. (CONF-850608—3). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011845.

From Spring conference on experimental mechanics; Las Vegas, NV, USA (9 Jun 1985).

This paper describes a method used to measure the tension developed between neighboring track sections of a T-142-track mounted on an M-60 tank at the Yuma Proving Grounds. Such information is important for input to the computer models being developed for the US Army Tank-Automotive Command. A section of track was instrumented with strain gages and mounted in a tensile testing machine. The strain gage output was calibrated as a function of tension. The calibrated track section was mounted on the tank and connected through a hard-wire electrical tether to a portable data acquisition system. A video recording system with a clock common to the data acquisition system was used to correlate environmental inputs to tension data. Initial track pretension levels were measured. Data were also acquired when the tank traversed several objects, moved uphill over an obstacle, and executed pivot turns. This data has been used in the new computer models.

31752 **Design of resilient processing plants. VII. Design of energy management system for unstable reactors - new insights.** Morari, M.; Grimm, W.; Oglesby, M.J.; Prosser, I.D. (Univ. of Wisconsin, Madison). *Chemical Engineering Science;* 40: No. 2, 187-198(1985). Contract AC02-80ER10645.

In previous parts of this series methods were developed for the design of plants which are not only optimal at some nominal operating point but which can also deal effectively with disturbances and changes in the operating conditions. These techniques are extended here and applied to synthesize the heat exchanger network and the control structure for a sequence of two exothermic open-loop unstable continuous stirred tank reactors.

31753 **Critical experiment needs and plans of the consolidated fuel reprocessing program.** Primm, R.T. (Oak Ridge National Laboratory, TN (USA)). pp 258-273 of Proceedings of the international seminar on criticality studies programs and needs. Is-sur-Tille, France; Commissariat a l'Energie Atomique (1984). (CONF-8309105—).

From International seminar on criticality experiments and data; Dijon, France (20 Sep 1983).

An integral part of the United States Department of Energy (DOE) plan for the development of breeder reactors is the development of the capability for fuel reprocessing. The Consolidated Fuel Reprocessing Program (CFRP) was established by the DOE to identify and conduct research and development activities in this area. The DOE is currently proposing that a capability to reprocess fast reactor fuel be established in the Fuels and Materials Examination Facility at the Hanford Engineering Development Laboratory. This capability would include conversion of plutonium nitrate to plutonium oxide. The reprocessing line is designated the Breeder Reprocessing Engineering Test (BRET). Criticality safety remains an important critetion in the design of the BRET. The different steps in the reprocessing are reviewed and areas where additional critical experiments are needed have been indentified as also areas where revision or clarification of existing criticality safety standards are desirable.

4203 Lasers

31754 **(AD-A—150292/1/XAB) Pulsed hydrogen-fluoride laser.** McLeary, R. (Materials Research Labs., Maribyrnong (Australia)). May 1984. 15p. (MRL-R—931). NTIS, PC A02/MF A01.

This report describes a pulsed hydrogen-fluoride laser constructed at MRL. The laser delivers an energy of 7 J in a microsecond pulse from vibrational-rotational transitions in the wavelength region 2.6-3.1-micrometers. It simultaneously produces 1 mJ of energy in a 1 microsecond pulse from pure rotational transitions in the wavelength region 10-17 micrometers.

31755 **(AD-A—150299/6/XAB) Near field/far field (nf/ff) energy loss in electric-discharge lasers (EDL's): a mode-medium interaction. Technical report.** Bentley, J.H. (Army Missile Command, Redstone Arsenal, AL (USA). Directed Energy Directorate). Aug 1984. 10p. NTIS, PC A02/MF A01.

High-energy CO_2 EDL's (Electric Discharge Lasers) with unstable resonators exhibit a mode-medium interaction that spreads the focused beam and causes loss in the far-field. Mirror edge Fresnelling may result in amplified feedback, which causes a parallelpiped structure to be burned into the lasing medium. Possible confirming experiments are described.

31756 **(AD-A—151199/7/XAB) Bibliography of Soviet laser developments, Number 67, September-October 1983.** (Defense Intelligence Agency, Washington, DC (USA). Directorate for Scientific and Technical Intelligence). 5 Dec 1984. 124p. (DIA-DST—2700Z-001-85). NTIS, PC A06/MF A01.

This is the Soviet Laser Bibliography for September-October 1983, and is No. 67 in a continuing series on Soviet laser developments. The coverage includes basic research on solid state, liquid, gas, and chemical lasers; components; nonlinear optics; spectroscopy of laser materials; ultrashort pulse generation; crystal growing; theoretical aspects of advanced lasers; and general laser theory. Laser applications are listed under biological effects; communications; beam propagation; adaptive optics; computer technology; holography; laser-induced chemical reactions; measurement of laser parameters; laser measurement applications; laser-excited optical effects; laser spectroscopy; beam-target interaction; and plasma generation and diagnostics.

31757 **(AD-A—151372/0/XAB) Calculations of collision-induced optical gain in high-density mixtures of D2 or HD with a buffer gas.** McLeary, R. (Materials Research Labs., Maribyrnong (Australia)). Oct 1984. 32p. (MRL-R—939). NTIS, PC A03/MF A01.

This report presents the results of calculations of collision-induced optical gain in vibrationally-excited mixtures of deuterium or hydrogen deuteride with a buffer gas. Gains of up to 0.07/cm are predicted for gas mixtures at high pressure and reduced temperature. Significant gain is predicted over a frequency range of approximately 2100/cm to 2700/cm (wavelength range 4.8 to 3.7 micrometers) for D2 mixtures and over the frequency range 2600/cm to 3300/cm(wavelength range 3.8 to 3.0 micrometers) for HD mixtures. These results indicate the feasibility of operation of collision-induced-dipole lasers which are continuously tunable over the above frequency ranges.

31758 (AD-A—151731/7/XAB) Spectroscopic investigation of materials for frequency-agile laser systems. Final report, 15 January 1982-14 January 1985. Powell, R.C. (Oklahoma State Univ., Stillwater (USA). Dept. of Physics). Jan 1985. 141p. NTIS, PC A07/MF A01.

This research involves the use of laser-spectroscopy techniques such as four-wave mixing, multiphoton absorption, time-resolved site-selection spectroscopy, and holography to characterize dynamical optical processes such as energy transfer, exciton migration, radiation-less relaxation, and the photorefractive effect. In addition, a significant effort was spent in the synthesis and characterization of new types of materials for tunable laser applications. The materials investigated include alexandrite, titanium-doped sapphire, lithium niobate, neodymium pentaphosphate, rhodium-doped rubidium calcium fluoride, manganese silicate, and neodymium-doped garnet crystals and glasses.

31759 (AD-A—151742/4/XAB) Collective effects in the free electron laser (FEL). Sprangle, P.; Tang, C.M.; Roberson, C.W. (Naval Research Lab., Washington, DC (USA)). 1984. 46p. NTIS, PC A03/MF A01.

With intense relativistic electron beams, such as generated by induction linear accelerators, pulsed-transmission-line accelerators or high-current RF linacs, collective effects can play an important role in the FEL process. High-gain FELs are said to operate in the Raman regime when collective effects dominate the usual ponderomotive effects. Collective effects may also play an important role in low-gain FELs when the beam current is sufficiently high. In this paper the linear and nonlinear dynamics of the FEL mechanisms, including space charge effects, is analyzed. The various collective and noncollective operating regimes are discussed.

31760 (AD-A—151760/6/XAB) High-gain xuv and x-ray free-electron lasers. Tang, C.M.; Sprangle, P. (Naval Research Lab., Washington, DC (USA)). 1984. 13p. NTIS, PC A02/MF A01.

Presented at the Free Electron Generation of Extreme Ultraviolet Coherent Radiation, AIP Conference 1984.

The operation of the free electron laser (FEL) oscillator in the xuv and x-ray regimes requires high-gain per pass to overcome somewhat large mirror losses. This paper summarizes the growth rates and intrinsic trapping efficiencies in the high gain regimes, and comments on various three-dimensional effects.

31761 (N—85-17182) Construction, testing of 1-MW nitrogen laser. Weidauer, R.; Glismann, A.; Konig, R.; Falk, H. (Joint Publications Research Service, Arlington, VA (USA)). Dec 1984. 2p. NTIS, PC A03/MF A01.

In its East Europe Report, science and technology, 40-41 p. (N—85-17176 08-31).

Nitrogen lasers (N2-lasers) have achieved considerable importance since their discovery in 1963. Preferred as pump light sources for nanosecond pigment lasers they are also used in photolysis experiments, fluorescence decay time measurements, in the determination of air pollution, the detection of oil traces or in material processing in semiconductor and microelectronics. The laser energy was measured by means of an absolutely calibrated, pyroelectric receiver; the pulse shape was determined by means of a fast photocell in combination with an SU-oscilloscope I 2-7. The time resolution of the overall system was about 0.5 ns. For measurements it was important to take into account that besides the strong UV-radiation at 337.1 nm, radiation was also emitted in the near IR between about 870 nm and 900 nm. The IR pulse exits from the laser with about 10 ns delay to the UV-pulse; its pulse width was measured at 7 ns, whereas that of the UV-signal amounts to 12 ns under optimum conditions. The energy in the IR-range amounts to around 5 percent of the UV-energy. By means of a dielectric edge filter (KCZ) the IR-fraction was reduced to less than about 0.5 percent in order to prevent falsification of the values when measuring in the UV-range.

31762 (PB—85-157873/XAB) Laser with hollow copper cathode. Lasser, T.; Schetter, K. (Institut Franco-Allemand de Recherches de Saint-Louis, 68 (France)). 14 Nov 1984. 23p. (In German). NTIS, PC E03/MF E03.

Prepared in cooperation with Centre de Documentation de l'Armement, Paris (France). Direction des Recherches, Etudes et Techniques.

The hollow-cathode discharge with its discharge properties and the excitation mechanisms occuring during it forms the foundation for hollow metal cathode lasers. Based on these properties, a hollow copper cathode laser was conceived and investigated experimentally.

31763 (SD-TR—83-92) Pulsed D_2-F_2 chain-laser damage to coated window and mirror components. Amimoto, S.T.; Whittier, J.S.; Whittaker, A.; Chase, A.; Hofland, R. Jr.; Bass, M. (Aerospace Corp., El Segundo, CA (USA). Aerophysics Lab.). 15 Dec 1983. 24p. NTIS, PC A02/MF A01. File Number DE85901412.

Large-spot laser damage thresholds were measured for bowl-feed-polished CaF_2 and sapphire windows (bare and antireflection-coated) and for highly polished copper mirrors (bare and carbyne-coated) at DF chain-laser wavelengths (3.58-4.78 μm). Commercially available antireflection-coated CaF_2 and Al_2O_3 samples were found to have damage thresholds from 17 to 28 J/cm². Significantly larger damage thresholds were observed for uncoated, polished samples of Al_2O_3, but damage resistance of uncoated polished CaF_2 was found to equal that of the best antireflection-coated CaF_2 samples. A highly polished copper mirror had the highest damage threshold of all the materials tested, i.e., 58 J/cm². Carbyne films of diamond-like hardness, a type of carbon coating, were applied to polished copper mirrors and bowl-feed-polished CaF_2 surfaces. The carbyne coatings prepared in this work contained numerous carbon-bearing particles that were easily damaged (~10 J/cm²). However, regions of the irradiated carbyne film that were free of carbon particles withstood high laser fluences (25 J/cm²).

31764 (UCRL—15561-Vol.3) Improved solid state laser sources. Final technical report, September 2, 1982-February 10, 1985. Volume 3. Byer, R.L.; Eckardt, R.C. (Stanford Univ., CA (USA). Dept. of Applied Physics). Apr 1985. Contract W-7405-ENG-48. 17p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012956.

Investigations have been performed in several areas of solid state laser development. Our research in slab-lasers has resulted in a theory of thermal effects and optical propagation which has allowed scaling to larger slabs and extention of the slab concept to crystalline laser hosts. Our study of nonlinear optical materials has been extended to include $AgGaSe_2$ and Nd:MgO:$LiNbO_3$. $AgGaSe_2$ is useful for nonlinear frequency conversion in the infrared out to 17 microns. Nd:MgO:$LiNbO_3$ allows a single crystal to be used simultaneously as both active laser material and nonlinear optical or modulator material. We have developed a single crystal fiber growth station which has potential application in material surveys by the rapid growth of small samples of crystalline laser materials for spectroscopic evaluation. These research activities combined with other current research programs form a coordinated effort which has resulted in several significant advances in laser development and nonlinear optics.

31765 (UCRL—15627) Investigation of the feasibility of pumping high energy neodymium glass lasers by chemical flashlamps. Final report. Shaffer, J.W. (GTE Sylvania Products Corp., Montoursville, PA (USA)). 18 May 1984. Contract W-7405-ENG-48. 104p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE85012962.

The purpose of the work reported was to determine if chemical reactions in chemical flashlamps could be accelerated to a sufficient degree that the available chemical energy could be radiated in a time comparable to the excited state lifetime of neodymium ions in glass (approximately 350 microseconds), with peak radiation power adequate for producing population inversion in large-aperture Nd-glass laser amplifiers. A second purpose of the work was to estimate the cost of fabrication of the most optimum chemical flashlamps which resulted from this investigation to determine the expected cost-per-shot of a chemical flashlamp pumped system for comparison with xenon flashlamp pumped systems. The work undertaken took two directions: to extend the work employing fluorine-containing oxidizers to higher loadings and shorter times, seeking the maximum peak radiation power; and to investigate the possibility of seeding cyanogen-oxygen combustion with species giving strong radiation in the pump bands of neodymium. (LEW)

31766 (UCRL—15659) **Refractive indices and thermo-optic coefficients of nonlinear crystals isomorphic to KH_2PO_4.** Kirby, K.W.; Hoefer, C.S.; DeShazer, L.G. (Hughes Research Labs., Malibu, CA (USA)). Feb 1985. Contract W-7405-ENG-48. 6p. (CONF-850573—3). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012968.

From Topical conference on basic properties of optical materials; Gaithersburg, MD, USA (7 May 1985).

Refractive indices and their thermal variations were measured for eleven KDP isomorphs. Samples of KDP from different suppliers showed different indices which correlated with observed differences in lattice parameters.

31767 (UCRL—15668) **Photoionization-pumped, Ne II, x-ray laser studies project. Final report.** Richardson, M.C.; Hagelstein, P.L.; Eckart, M.J.; Forsyth, J.M.; Gerrassimenko, M.; Soures, J.M. (Rochester Univ., NY (USA). Lab. for Laser Energetics; Lawrence Livermore National Lab., CA (USA)). 1984. Contract W-7405-ENG-48. 77p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85012973.

The energetics of this pumping scheme are shown. Short-pulse (50 to 100 ps) laser irradiation of an appropriate x-ray flash-lamp medium generates broad-band emission in the range of 300 to 800 eV which preferentially photoionizes Ne to the ^2S state of Ne II creating an inversion at approximately 27 eV. Although this approach does not depend on precise spectral overlap between the x-ray pump radiation and the medium to be pumped, it does require that the x-ray medium remain un-ionized prior to photoionization by the soft x-ray emission. Well-controlled focus conditions are required to ensure that the x-ray medium is not subjected to electron or x-ray preheat prior to irradiation by the soft x-ray source. The magnitude of the population inversion is predicted to be critically dependent upon rapid photoionization of the two states; therefore, ultra-short pulse irradiation of the laser flashlamps is required.

31768 **Cavity supermodes for gain-saturated diode laser arrays.** Hadley, G.R. (Division 1512, Sandia National Laboratories, Albuquerque, New Mexico 87185). *Journal of Applied Physics;* **58**: No. 1, 97-100(1 Jul 1985).

We present a numerical method for the solution of the cavity modes of a multichannel array of laser diodes. The analysis is based on coupled-mode theory and includes the appropriate boundary conditions for the electric field at each reflecting facet. Saturable gain is also included, with saturation arising from both the forward-going and reflected waves. We present results which differ from a recent analytic analysis for the case of two channels with different gains and propagation constants. The present work predicts "cavity supermodes" which are similar to the "symmetric" and "antisymmetric" waveguide supermodes previously described in the literature. These cavity modes are characterized by equal intensities in both channels even when the channel gains are grossly different.

31769 **Statistical optics applied to high-power glass lasers.** Manes, K.R.; Simmons, W.W. (Lawrence Livermore National Laboratory, P.O. Box 5508, L-493, Livermore, California 94550). *Journal of the Optical Society of America A: Optics and Image Science;* **2**: No. 4, 528-538(Apr 1985). Contract W-7405-ENG-48.

Multiterawatt laser systems, particularly the Novette system at the Lawrence Livermore National Laboratory, are simulated using statistical-optics techniques. The results are compared with experimental observations.

31770 **Mechanism of four-level laser action in solution excimer and excited-state proton-transfer cases.** Khan, A.U.; Kasha, M. (Florida State Univ., Tallahassee). *Proceedings of the National Academy of Sciences of the United States of America;* **80**: 1767-1770(Mar 1983). Contract AS05-78EV05855.

Four-level laser energy level schemes are compared from the mechanistic spectroscopic viewpoint: (1) noble-gas excimer, (2) solution molecular excimer, (3) conventional dye laser, and (4) intramolecular proton transfer. The lasing action of the chlorophyll special pair is discussed as an example of a solution excimer laser, and the lasing action of 3-hydroxyflavone and other molecules is discussed as an example of an intramolecular proton-transfer laser.

4204 Heat Transfer And Fluid Flow

31771 (AD-A—151965/1/XAB) **Two-d heat transfer through porous media with heat generation. Master's thesis.** Martinez, B. (Naval Postgraduate School, Monterey, CA (USA)). Jun 1984. 135p. NTIS, PC A07/MF A01.

This thesis investigation develops an axisymmetric heat transfer-combustion model of a porous medium within a circular cylinder. System flow is governed by Darcy's law. Carbon and air properties are treated as variables of temperature. A combined continuity-Darcy equation, an oxygen-mass-balance equation, and energy-balance equations (one each) for air and carbon, describe the conservation laws of the system. Transport mechanisms for oxygen mass transfer are molecular diffusion and convective transport, and an oxygen consumption term to account for combustion is included. Heat-transfer mechanisms included in the model are conduction and convection. Radiation is accounted for at applicable boundaries only. Nonvolatile combustion is accounted for in the carbon energy and oxygen-mass-balance equations as a heat-generation term of Arrhenius type. The numerical solution of four coupled, nonlinear, transient partial differential field equations is accomplished using the Galerkin formulation of the Finite Element Method. The effect of porosity of system behavior is examined.

31772 (AECL—8066) **Numerical computation of phase distribution in two fluid flow using the two-dimensional TOFFEA code.** Carver, M.B. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Aug 1983. 47p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701482.

A new iterative approach has been developed for multi-dimensional computational analysis of two fluid flow. It has been implemented and tested in a two-dimensional computer code. Parametric surveys are described to illustrate that this code rationally predicts separation of two fluid flows under gravitational and centrifugal influences. Comparisons are made between behaviour computed by the code, and results reported in experimental studies of air and water flowing in elbows and pipes. Plans for extending the code to three dimensions are discussed, as are methods for incorporating an improved model of turbulence.

31773 (DOE/MC/20334—T19) **Study of deposition control using transpiration. Technical progress report.** Louis, J.F.; Kozlu, H. (Massachusetts Inst. of Tech., Cambridge (USA)). May 1985. Contract AC21-83MC20334. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012799.

As a result of the previous analysis of the data on concentration profiles, we have proceeded with the modeling of particle transport across the transpired turbulent boundary layer by introducing the Schmidt number as a function of the normal distance to the wall. A major problem is to determine how the Schmidt number varies within the boundary layer. Schmidt number is affected by the flow structure as well as the mechanics of aerosols. Our validated model for transpired turbulent boundary layer has shown that eddy sizes are constant across the boundary layer. Therefore, we expect that the Schmidt number should be constant for every particle size in the boundary layer operating with strong blowing except for the region very close to the wall. Based on the above analysis, we expect that these structure differences in the flow will cause a drastic change (i.e., like a step function) of Schmidt number very near the wall. The region close to the wall has to be carefully characterized. For large injection rates, the flow close to the wall is dominated by the injected flow emerging from the porous wall. According to the manufacturer, the porous wall is made of very small beads with a diameter of 6 μ. Therefore the emerging flow has non-uniformity characterized by a maximum length of 6 μ which is appreciably smaller than the particle diameter, i.e., 16 μ. In the region very close to the wall, the Schmidt number associated with the particles is large.

31774 (JAERI-M—83-184) **HEATING5-JR: a finite difference computer program for nonlinear heat conduction problems.** Ikushima, Takeshi; Nakazato, Chikara. (Japan Atomic Energy Research Inst., Tokyo). Nov 1983. 105p. (In Japanese). NTIS (US Sales Only), PC A06/MF A01. File Number DE85701121.

Computer program HEATING5-JR is a revised version of HEATING5 which is a finite difference computer program used for the solution of multi-dimensional, nonlinear heat conduction problems. Pre- and post-processings for graphical representations of input data and calculation results of HEATING5 are avaiable in HEATING5-JR. The calculation equations, program descriptions and user instructions are presented. Several example problems are described in detail to demonstrate the use of the program.

31775 (NASA-TM—83739) **Investigation of the three-dimensional flow field within a transonic fan rotor: experiment and analysis.** Pierzga, M.J.; Wood, J.R. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1984. 26p. (CONF-840611—4; USAAVSCOM-TR—83-C-16). NTIS, PC A03/MF A01. File Number TI85901299.

From International gas turbine conference and exhibit; Amsterdam, Netherlands (4 Jun 1984).

An experimental investigation of the three-dimensional flow field through a low aspect ratio, transonic, axial-flow fan rotor has been conducted using an advanced laser anemometer (LA) system. Laser velocimeter measurements of the rotor flow field at the design operating speed and over a range of through-flow conditions are compared to analytical solutions. The numerical technique used yields the solution to the full, three-dimensional, unsteady Euler equations using an explicit time-marching, finite volume approach. The numerical analysis, when coupled with a simplified boundary layer calculation, generally yields good agreement with the experimental data. The test rotor has an aspect ratio of 1.56, a design total pressure ratio of 1.629 and a tip relative Mach number of 1.38. The high spatial resolution of the LA data matrix (9 radial by 30 axial by 50 blade-to-blade) permits details of the transonic flow field such as shock location, turning distribution and blade loading levels to be investigated and compared to analytical results.

31776 (NUREG/CR—0200-Vol.2, pp vp, Section F10) **HEATING6: a multidimensional heat conduction analysis with the finite-difference formulation.** Elrod, D.C.; Giles, G.E.; Turner, W.D. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007576. (ORNL/NUREG/CSD—2/Vol.2). Contract W-7405-ENG-26.

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 2. Functional modules.

HEATING6, a modification of the generalized heat conduction code HEATING5, is designed to solve steady-state and/or transient heat conduction problems in one-, two-, or three-dimensional Cartesian or cylindrical coordinates or one-dimensional spherical coordinates. The thermal conductivity, density, and specific heat may be both spatially and temperature-dependent. The thermal conductivity may be anisotropic. Materials may undergo a change of phase. Thermal properties of materials may be extracted from a material properties library. Heat generation rates may be dependent on time, temperature and position, and boundary temperatures may be time- and position-dependent. The boundary conditions, which may be surface-to-boundary or surface-to-surface, may be specified temperatures or any combination of prescribed heat flux, forced convection, natural convection, and radiation. The thermal efficiency of certain finned surfaces may be modeled. The boundary condition parameters may be time- and/or temperature-dependent. The mesh spacing may be variable along each axis. HEATING6 is variably dimensioned and utilizes free-form input. This report includes a discussion of the numerical techniques used by HEATING6, sections on the program structure and modeling concepts, a detailed set of instructions for preparing input data and using the code, and several sample problems.

31777 (NUREG/CR—0200-Vol.2, pp vp, Section F13) **HEATPLOT-S: a temperature distribution plotting program for HEATING5/HEATING6.** Cobb, C.K. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007576. (ORNL/NUREG/CSD—2/Vol.2).

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 2. Functional modules.

HEATPLOT-S is a temperature distribution plotting program that may be used with the HEATING5 or HEATING6 generalized heat conduction codes. HEATPLOT-S has the capability of generating temperature contours, temperature-time profiles, and temperature-distance profiles from the current HEATING5/HEATING6 temperature distribution or from the temperature changes relative to the initial temperature distribution. Contour plots may be generated for two- or three-dimensional models. Temperature-time and temperature-distance profiles may be generated for one-, two-, or three-dimensional models. HEATPLOT-S uses the DISSPLA (Display Integrated Software System and Plotting Language) graphics package, and generates a compressed plot data set that can be stored on disk or routed to various plotting devices. Subsections are: introduction, input, and sample problem.

31778 (NUREG/CR—0200-Vol.2, pp vp, Section F14) **REGPLOT6: a plotting program to verify HEATING6 input data.** Cobb, C.K. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007576. (ORNL/NUREG/CSD—2/Vol.2).

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 2. Functional modules.

REGPLOT6 is a plotting program that enables the user of the HEATING6 generalized heat conduction code to graphically verify the accuracy of HEATING6 input data. Maps of the regions, the materials, the heat generation function numbers, the initial temperature function numbers, and the boundary condition function numbers are generated by plotting the region boundaries and labeling each region appropriately. REGPLOT6 uses the DISSPLA (Display Integrated Software System and Plotting Language) graphics package, and generates a compressed plot data set that can be stored on disk or routed to various plotting devices. Subsections are introduction and input/sample problem.

31779 (SAND—84-0878) **PETROS: a program for calculating transport of heat, water, water vapor and air through a porous material.** Hadley, G.R. (Sandia National Labs., Albuquerque, NM (USA)). May 1985. Contract AC04-76DP00789. 68p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85013168.

The one-dimensional code PETROS computes the transport of water, water vapor, an inert gas, and heat through a partially saturated porous medium. The mass flux of liquid water is driven by gradients in saturation, temperature, and gas pressure as well as the force of gravity. Gas transport includes effects due to Knudsen diffusion and binary gaseous diffusion of each gas component, plus Darcy flow of the gas mixture. Evaporation and condensation are accounted for, both in the fluid mass balance and the heat equation. This report includes a description of the model assumptions and the resulting equations, together with the numerical techniques used to obtain problem solutions. Included also are instructions for running the code, and a sample problem. 8 refs.

31780 (UCRL—91617) **Compressible two-phase flow instabilities simulated with a hybrid Lagrange-Euler pseudospectral method.** Buckingham, A.C. (Lawrence Livermore National Lab., CA (USA)). 29 Mar 1985. Contract W-7405-ENG-48. 13p. (CONF-850745—6). NTIS, PC A02/MF A01; GPO Dep. File Number DE85009904.

From 4. international conference on numerical methods in laminar and turbulent flow; Swansea, UK (8 Jul 1985).

A pseudospectral collocation procedure has been developed specifically for studying unsteady, compressible flow instability growth and subsequent random flow states signaling turbulence onset. A mass centered Lagrange moving mesh is used for resolving compressibility and material interfaces. The Lagrange mesh is combined with a fixed Eulerian mesh over which spanwise compo-

nents are resolved with a spectral transform method. Time evolution is approximated by means of a conventional third-order Runge Kutta procedure. A Rayleigh-Taylor unstable liquid propellant gas vapor interface situation is simulated during the initial growth phase of the perturbation. The influence of super-imposed pressure oscillations on the fuel sheet breakup is examined.

31781 (UCRL—92505) **New semi-implicit method for solving the time-dependent conservation equations for incompressible flow.** Gresho, P.M.; Chan, S.T. (Lawrence Livermore National Lab., CA (USA)). Apr 1985. Contract W-7405-ENG-48. 21p. (CONF-850745—5). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85010926.

From 4. international conference on numerical methods in laminar and turbulent flow; Swansea, UK (8 Jul 1985).

A semi-implicit time integration scheme for the advection-diffusion equation, in which the advection terms are stepped forward in time using explicit Euler and the diffusion terms, which include a truncation error correction term, are integrated via the trapezoid rule, is described and demonstrated. In the extension to the Navier-Stokes and Boussinesq equations, all additional terms are integrated via explicit Euler.

31782 (UFRJ-COPPE-PEN—119) **Rewetting of fuel elements in nuclear reactors-a variational treatment.** Carmo, E.G.D. do; Roberty, N.C.; Oliveira, L.F.S. de; Kinrys, S. (Rio de Janeiro Univ. (Brazil). Coordenacao dos Programas de Pos-graduacao de Engenharia). Feb 1983. 18p. (In Portuguese). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701483.

A variational formulation for a fuel rod rewetting problem, during a LOCA is presented. This formulation allows to solve the problem for any profile of the Biot number. So, the general formulation of the problem is presented, and an application of the model is done, considering three regions of heat transfer, being the Biot number constant for each region. A iterative procedure was developed to determine the rewetting velocity and the quench-front size. The semi-analytical solution, for all the cases, was obtained by the Ritz method. Some of the results, such as the variation of the quench-front size and the rewetting velocity with the cladding temperature before the reflood and with the inlet coolant temperature are discussed.

31783 **Radiative and convective transfer in a cylindrical enclosure for a real gas.** Smith, T.F.; Shen, Z.F.; Alturki, A.M. (Department of Mechanical Engineering, The University of Iowa, Iowa City, Iowa 52242). *Journal of Heat Transfer;* **107**: No. 2, 482-505(May 1985). Contract AC02-79ER10515.

Heat transfer and temperature distributions are calculated for gas flow in a black wall circular duct. (AIP)

31784 **Heat conduction through layered refractory linings.** Buyukozturk, O.; Tseng, T.M. (Massachusetts Institute of Technology, Cambridge). *Journal of Engineering Mechanics;* **109**: No. 4, 1000-1015(Aug 1983).

A predictive model is developed for transient heat-transfer analysis of structures with layered heterogeneous media. The model is particularly suited for the analysis of refractory-concrete-lined coal-gasification and other similar chemical-processing vessels. To allow for the effects of high-conductivity gases in voids and cracks on the overall conductivity of the media, an effective conductivity model is developed. The model incorporates the effects of temperature-dependent nonlinear material properties. Validity of the model is shown by comparing the predictions with those from an analytical solution for a special case, another numerical solution, and experimental measurements from an actual test vessel. Sensitivity of the temperature distribution to the presence of hydrogen gas in the vessel environment is evaluated. 36 references, 11 figures, 2 tables.

31785 (BDX—613-3260) **X-ray fluorescence analysis of 304L stainless steel. Final report.** Lantz, L.L. (Allied Corp., Kansas City, MO (USA). Bendix Kansas City Div.). May 1985. Contract AC04-76DP00613. 25p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013254.

This project was undertaken to develop a faster, more accurate method to determine the composition of 304L vacuum arc remelted (VAR), corrosion resistant steel. An accurately measured composition is required to predict the 304L ferrite content, which must be controlled to produce crack resistant welds. An x-ray fluorescence spectrometry method has been developed for the analysis of 12 elements in 304L steel. The sample composition is calculated using the XRF-11 fundamental parameters computer program (Criss Software, Incorporated, Largo, MD) for x-ray fluorescence analysis. Absolute accuracies within +-0.1 wt % are obtained for chromium and nickel in certified standards analyzed as samples by using program standards having composition close to sample composition and by making matrix corrections for all elements in the standards and samples. A comparison is made of the chromium concentration in 24 304L samples determined by the x-ray method and by wet chemical analysis.

31786 (CEA-CONF—7536) **Synergy effect in accident simulation.** Alba, C.; Carlin, F.; Chenion, J.; Gaussens, G.; Le Meur, M.; Petitjean, M. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. d'Analyse de Surete). May 1984. 26p. (In French). (CONF-840516—10; DAS—85). NTIS (US Sales Only), PC A03/MF A01. File Number DE85751316.

From International symposium on aging in tests of safety equipment for nuclear power plants; Paris, France (15 May 1984).

Accidental breaking of PWR coolant canalization would entail water vaporization into confinement enclosure. Equipments would be simultaneously subjected to temperature and pressure increase, chemical spray, and radiation action of reactor core products. Some equipments have to work after accident in order to stop reactor running and blow out water calories. Usually, in France, accident simulation tests are carried out sequentialy: irradiation followed by thermodynamical and chemical tests. Equipments working is essentially due to those polymer materials behaviour. Is the polymers behaviour the same when they are either subjected to sequential test, or an accident (simultaneous action of irradiation and thermodynamical and chemical sequence). In order to answer to this question, nine polymer materials were subjected to simultaneous and sequential test in CESAR cell. Experiments were carried out in CESAR device with thermodynamical chocks and a temperature and pressure decrease profil in presence or without irradiation. So, the test is either simultaneous or sequential. Mechanical properties change are determined for the following polymeric materials. Two polyamide-imide varnishes used in motors and coils; one epoxydic resin, glass fiber charged (electrical insulating); polyphenylene sulfide, glass fiber charged, the Ryton R4 (electrical insulating); three elastomeric materials: Hypalon, fire proof by bromine or by alumina EPDM (cables jacket); VAMAC which is a polyethylene methyl polymethacrylate copolymer; then a silicon thermoset material glass fiber charged (electrical insulating). After test, usually, mechanical and electrical properties change of polymer materials show sequential experiment is more severe than simultaneous test however, Hypalon does not follow this law. For this polymer simultaneous test appears more severe than sequential experiment.

some investigations conducted for industry will be briefly described, with neutron radiography as a complementary technique to conventional industrial radiography being dealt with in greater detail. The applications of nuclear technology in industry are very versatile, both in range of applications as well as in the variety of techniques which can be used. It's applications include the following: i) rapid assay of gold purity; behaviour of potassium in a blast furnace; performance of continuous massecuite crystalysers; airflow measurement in mine shafts; monitoring of electrode length in an electrical arc furnace; monitoring of termite damage in wooden utility poles; behaviour of pollutants in the Crocodile river; distribution of boron in steel and in measuring the dynamic behaviour of materials in processing plants.

31788 (CSIR-TSD—0009/83, pp vp) **Standing of industrial radiography in South Africa.** Marais, J.J. (Uniray Technical Services (Pty.) Ltd.). Oct 1983. CSIR, P.O. Box 395, Pretoria, 0001, South Africa. (CONF-8310380—).

From Mini-seminar on non-destructive testing; Pretoria, South Africa (1 Oct 1983).

In this article a look is taken at industrial radiography in South Africa to determine where radiographic testing is being used, and for what reasons. The status of training of industrial radiographers is considered and it is compared to radiographic techniques used in South Africa.

31789 (CSIR-TSD—0009/83, pp vp) **New developments in industrial radiography.** Daker, W.J. (SA X-ray (Pty.) Ltd.). Oct 1983. CSIR, P.O. Box 395, Pretoria, 0001, South Africa. (CONF-8310380—).

From Mini-seminar on non-destructive testing; Pretoria, South Africa (1 Oct 1983).

The article deals with new developments in industrial radiography and also investigates the problem of limiting material thickness of either very thick or very thin materials. Ytterbium 169 has an ideal energy level for the radiography of material thinner than 10mm of steel. It also has an extremely high specific activity. To decide upon the optimum radiation type and energy level it is necessary to consider the imaging method which is to be used. This includes: radiographic films; microfilming; image processing; image manipulation; image enhancement; automatic interpretation; fluorovision; image intensifiers and x-ray videcon cameras.

31790 (CSIR-TSD—0009/83, pp vp) **Flash radiography.** Botten, S.F. (SA X-ray (Pty.) Ltd.). Oct 1983. CSIR, P.O. Box 395, Pretoria, 0001, South Africa. (CONF-8310380—).

From Mini-seminar on non-destructive testing; Pretoria, South Africa (1 Oct 1983).

Flash radiography is a technique of radiography that has been used to a limited degree in South Africa, its users being restricted to ballistics and Research and Development in this field. In flash radiography the object being radiographed is by no means static. In flash radiography the object or event being radiographed, is not only obscured, but it is also in motion at very high speeds or very short duration. An image can only be obtained by a very short duration single pulse of x-rays. The main problem encountered with flash radiography was the production of exposures of very short duration and extremely high output. Specialised x-ray equipment was needed for this.

31791 (CSIR-TSD—0009/83, pp vp) **Basic principles of industrial radiography.** Bestbier, P. (S.A. Bureau of Standards, Western Cape Region). Oct 1983. CSIR, P.O. Box 395, Pretoria, 0001, South Africa. (CONF-8310380—).

From Mini-seminar on non-destructive testing; Pretoria, South Africa (1 Oct 1983).

X-ray radiography and gamma radiography are used in industrial radiography. X-rays and gamma rays have the ability to penetrate materials and be absorbed by different densities. This characteristic makes them useful tools in industrial and medical radiography. The sources used for the generation of x-rays, gamma rays and radioisotopes are discussed. Films are one of the recording methods of x-radiography. The article also deals with advantages and disadvantages of radiography. Factors governing radiation exposure includes: the type of radiation source, material to be radiographed, distance, film, and the method for development. International specifications are also responsible for strict control over the standard of workmanship in industrial radiography.

31792 (CSIR-TSD—0009/83, pp vp) **Radiological safety aspects of industrial radiography.** Hanekom, A.P. (Atomic Energy Board, Pelindaba, Pretoria (South Africa)). Oct 1983. CSIR, P.O. Box 395, Pretoria, 0001, South Africa. (CONF-8310380—).

From Mini-seminar on non-destructive testing; Pretoria, South Africa (1 Oct 1983).

Industrial radiography and especially gamma-radiography, has established itself as a very powerful tool in non-destructive testing. Unfortunately there is an amount of risk attached to the use of industrial radiography. The primary causes of radiography accidents include: working conditions, equipment failure and lack of supervisory control. To alleviate the radiological risks involved with gamma-radiography, the Atomic Energy Corporation (AEC) has imposed various conditions for the possession, use, and conveyance of radioactive material. This includes personnel training and equipment specifications.

31793 **(CSIR-TSD—0009/83) Mini-seminar on non-destructive testing.** (Council for Scientific and Industrial Research, Pretoria (South Africa). Dept. of Technical Services). Oct 1983. 14p. (CONF-8310380—). CSIR, P.O. Box 395, Pretoria, 0001, South Africa.

From Mini-seminar on non-destructive testing; Pretoria, South Africa (1 Oct 1983).

Individual items in scope for the data base are processed separately.

31794 **(DOE/ER/13163—6) Mechanical interactions of rough surfaces. Quarterly progress report, December 31, 1984-March 31, 1985.** McCool, J.I.; Hadden, G.B. (SKF Industries, Inc., King of Prussia, PA (USA)). Mar 1985. Contract AC02-84ER13163. 60p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85010390.

Full film traction test results obtained at various loads and speeds with two oils, two test elements (a ball and roller) and with and without lateral sliding, are presented and discussed. Lubricant properties deduced from the tests performed without lateral sliding were used with the Tevaarwerk-Johnson fluid traction model incorporated within program TRIBOS, to predict the corresponding traction coefficient and traction curve slope in the presence of lateral sliding. Tests designed to infer the asperity Coulomb friction coefficient in the partial film or mixed EHD region are described. Surface roughness parameters obtained by digital processing of the multiple traces made on these disks used in the mixed traction tests are summarized. The criteria that these parameters must satisfy for internal consistency and hence for proper functioning within a microcontact model are derived. Modifications to computer program SKARESIM are described. Methodology for estimating the value of the mean square profile curvature m_4 using the output of a conventional stylus profile instrument is evaluated. Predicted and directly measured values of m_4 are compared and shown to be consistent within sampling error. A procedure is described for assessing via SKARESIM, a criterion which alleges that stylus profile fidelity is acceptable when m_4 does not exceed the inverse of the square of the profile radius.

31795 **(EPRI-NP—3821-SR) Nondestructive evaluation program: progress in 1984.** Dau, G.J.; Behravesh, M.M.; Lapides, M.E.; Liu, S.N.; Oldberg, T.; Quinn, J.R.; Scheibel, J.R.; Viswanathan, R.; Welty, C. (Electric Power Research Inst., Palo Alto, CA (USA). Systems and Materials Dept.). May 1985. 330p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920658.

In 1984 - its tenth year - the EPRI nondestructive evaluation program included initial assessment of a high-speed ultrasonic imaging system for real-time on-site flaw detection and successful demonstration of several advanced BWR pipe inspection systems among its achievements. This year also saw expansion of inspection training and demonstrations of new procedures at EPRI's NDE Center.

31796 **(EUR—8484) Destructive examination of test plates 1 and 2 of the defects detection trials (DDT).** Crutzen, S.; Buegers, W.; Violin, F.; Di Piazza, L.; Cowburn, K.; Sargent, T. (Commission of the European Communities, Luxembourg; Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1984. 48p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701487.

The evaluation of NDT exercises results has been based on destructive examination of the plates or test blocks used during the exercise. The PISC Programme has shown that in all cases the indications given by the NDT instrumentation were corresponding to some particular defects or structure aspects in the steel or were explained by particular positions of reflectors. Generally the introduction of defects do not produce a final "defective zone or area" which is strictly corresponding to the intended defect. The DDT exercise management has thus decided to perform a complete destructive examination of the four plates involved in this exercise because of its experience (the PISC I exercise) and independance of commercial interest, the JRC of the CEC Ispra Establishment has been asked to do the work with the Risley Nuclear Power Development Laboratories (RNL). The present report describes the results of the destructive examination of the DDT plates 1 and 2.

31797 **(SKI-B—30-78) Dimensions of defects determined by radiographical testing.** Oesterberg, J. (Swedish Nuclear Power Inspectorate, Stockholm; Swedish Plant Inspectorate, Stockholm). [1985]. 24p. (In Swedish). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701239.

Normally industrial radiography using x-rays or radionuclides gives information on the existence of defects in welds. These defects may in some instances be harmless, the size of the flaw is important. Radiography may be used for determining the thickness of the defect in many cases, by measuring the blackening of the photographic film used. The report gives a theoretical treatment of the problems and goes on to practical examples of the application. For flaws that have a width of at least 0.3 mm, a thickness of the order 0.1 mm can be determined with sufficient accuracy in materials 40 mm thick.

31798 **(UCRL—92010-Rev.1) Hopkinson bar simulation using DYNA2D. Revision 1.** Smith, J.A.; Glover, T.A. (Lawrence Livermore National Lab., CA (USA)). 1 May 1985. Contract W-7405-ENG-48. 7p. (CONF-850466—4-Rev.1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012928.

From 2. symposium on the interaction of non-nuclear munitions with structures; Panama City, FL, USA (15 Apr 1985).

A finite-element simulation of a Split Hopkinson's bar (Kolsky apparatus) technique involving mortar specimens is accomplished with DYNA2D, an explicit two-dimensional finite-element code. Calculations are compared with experimental results contained in a University of Florida report Dynamic Response of Concrete and Concrete Structures, and with analytic solutions of the appropriate wave propagation problem.

REFER ALSO TO CITATION(S) 32000, 32073

31799 **Management of vacuum leak-detection processes, calibration, and standards.** Wilson, N.G. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* 3: No. 3, 533-537(May 1985).

Vacuum leak detection requires integrated management action to ensure the successful production of apparatus having required leak tightness. Implementation of properly planned, scheduled, and engineered procedures and test arrangements are an absolute necessity to prevent unexpected, impractical, technically inadequate, or unnecessarily costly incidents in leak-testing operations. The use of standard procedures, leak standards appropriate to the task, and accurate calibration systems or devices is necessary to validate the integrity of any leak-test procedure. In this paper, the need for implementing these practices is discussed using case histories of typical examples of large complex vacuum systems. Aggressive management practices are of primary importance throughout a project's life cycle to ensure the lowest cost; this includes successful leak testing of components. It should be noted that the opinions and conclusions expressed in this paper are those of the author and are not those of the Los Alamos National Laboratory or the Department of Energy.

31800 **Underground remotely controlled cryopump vacuum system utilizing 460-m long helium gas lines.** Karpenko, V.P.; Beat, T.; Wong, K.; Sullenburger, J.; Kountainis, B.; Price, S. (Lawrence Livermore National Laboratory, L-122, Livermore, California 94550). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* 3: No. 3, 1690-1694(May 1985). Contract W-7405-ENG-48.

A 1600 l vacuum chamber buried 300 m underground required a continuous operational vacuum of $<1 \times 10^{-6}$ Torr. Due to physics criteria, high gas load (2×10^{-3} Torr l/s), space limitations, harsh operating environment and reliability requirements, a cryopump vacuum system was designed to meet all design and operational requirements. The vacuum system consisted of downhole and uphole subsystems linked by 460 m long pressurized copper helium gas lines and control cables. The uphole subsystem consisted of the helium compressors, automatic control, and monitoring system. The downhole system consisted of the vacuum pumps and all related supported hardware necessary for long unattended remote operation. The design, installation, and operational requirements are reviewed and summarized for this initial and unusual application of remotely operated cryopumps.

REFER ALSO TO CITATION(S) 30667, 30687, 31538, 31555, 31978, 31991

31801 **(AD-A—150429/9/XAB) Control of cascaded induction-generator systems. Final technical report, 1 September 1983-30 August 1984.** Ortmeyer, T.H. (Clarkson Coll. of Tech., Potsdam, NY (USA). Dept. of Electrical and Computer Engineering). 13 Dec 1984. 63p. NTIS MF A01.

This report documents an investigation of the stability and control of cascaded doubly fed machines (CDFM). These machines are brushless variable-speed constant-frequency electric power generators with potential for application in aircraft. A previous analytical study indicated the CDFM system would be controllable in the subsynchronous operating mode with a passive RL load. The present study contains two steps. First is an investigation of the machine operation in the supersynchronous mode. The second step is an investigation of machine operation with output capacitors providing excitation VARs for the machine and load. Step 1 results show that the machines exhibit stability characteristics in the supersynchronous mode similar to those observed in the subsynchronous mode. Step 2 results show that output capacitors degrade the system performance, particularly at light loads. The results show that output current feedback can be employed to improve the system performance.

31802 **(AD-A—152059/2/XAB) Manufacturing methods and technology for electromagnetic components. Interim report.** Bunker, E.R.; Arnett, J.R.; Williams, J.L. (Hughes Aircraft Co., Culver City, CA (USA)). Oct 1978. 215p. NTIS, PC A10/MF A01.

The purpose of the present MMandT program is to investigate, evaluate, and implement techniques for the manufacture of low-cost, highly reliable electromagnetic components for missile-systems applications. The emphasis is on implement, through a continuing program to rapidly disseminate this information to electromagnetic component manufacturers with the purpose of assisting them to produce lower-cost, more-reliable products. The basic effort phase of this program, reported in this documented, was concerned with two tasks: improving the manufacturing methods of potting/encapsulation, and investigating the winding techniques of electromagnetic devices. Three remaining tasks, now in process, are: interconnection techniques, tooling, and structural parts, to be covered in a subsequent report. It is anticipated that the combined results of these five tasks will implement improved manufacturing methods for electromagnetic components so that a significant payback in manufacture and life-cycle costs of present and future missile systems, due to lower production costs, higher process yield, and improved reliability will be obtained.

31803 **(BDX—613-3230) Thermally induced failures of thick-film glaze resistors.** Raffety, M.S.; Tuohig, W.D. (Allied Corp., Kansas City, MO (USA). Bendix Kansas City Div.). May 1985. Contract AC04-76DP00613. 20p. (CONF-850599—2). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012014.

From 35. electronics components conference; Washington, DC, USA (20 May 1985).

Thick-film glaze resistors are particularly attractive for use in environments subject to extreme changes in temperature because of their low TCR values. Recently, however, it has been shown these resistors may fail when they are subjected to extended temperature cycling. The failures are characterized by increasing resistance with cycling and may ultimately culminate in a completely open condition. Examination of the failed components using a scanning electron microscope revealed the presence of cracks in the resistive glaze. The microstructural origin and propagation of these cracks are discussed in terms of an elastic model, and solutions to the problem of thermal cycling failure are proposed.

31804 **(CONF-850558—2) Infrared generation and wave-mixing studies in cesium.** Christian, W.; Stockdale, J.A.D.; Dodhy, A.; Compton, R.N. (Oak Ridge National Lab., TN (USA); Davidson Coll., NC (USA)). 1985. Contract AC05-84OR21400. 7p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012883.

From Conference on lasers and electro-optics; Baltimore, MD, USA (21 May 1985).

A Nd-YAG pumped dye laser and heat pipe has been used to investigate stimulated infrared production, wave mixing, and ionization in cesium vapor near the one-photon resonant 7P/sub 1/2,3/2/ fine structure states.

31805 **(LA-UR—85-1936) Multi-megampere current interruption from explosive deformation of conductors.** Goforth, J.H.; Williams, A.H.; Marsh, S.P. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 5p. (CONF-850616—15). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012756.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

Two approaches for using explosives to interrupt current flowing in solid conductors are described. One concept uses explosives to extrude the switch conductor into thin regions that fuse due to current in the switch. A preliminary scaling law is presented. The second approach employs dielectric jets to sever current carrying conductors. A feasibility experiment and an improved design are described.

31806 **(LA-UR—85-1939) Multi-megampere operation of plasma compression opening switches in planar geometry.** Goforth, J.H.; Erickson, D.J.; Williams, A.H.; Greene, A.E. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 5p. (CONF-850616—14). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012755.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

Experiments are described in which a plasma compression opening switch is used in planar geometry to sharpen the output pulse of an explosive-driven magnetic flux compression generator. Included are data from tests where peak opening switch currents range from 5.7 to 9.3 MA. The switch is used to transfer current to a static low-inductance load ($\sim$10 nH) with an efficiency of 50% or better and a risetime as low as 0.45 μs. Results related to current transfer are interpreted within a simple analytical model.

31807 **(ORAU/IEA—85-3(M)) Electronic information management and productivity.** Sigmon, E.B. (Oak Ridge Associated Universities, Inc., TN (USA)). Apr 1985. Contract AC05-76OR00033. 40p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85013362.

Recent work by other researchers at IEA has developed a technical basis for Schurr's quarter-century-old hypothesis that energy form influences technological progress. Electrification leads to technological advances because its characteristic flexibility and controllability circumvent barriers inherent with other means of delivering energy to processes. Typically, the productivity impacts of electrification occur in two stages: Small gains are realized when the electric technology is directly substituted for the established non-electric technology; larger gains accrue from subsequent reorganization of the production process permitted by the superior flexibility of the electric technology. This report examines electricity's role as an information medium and finds parallels to its role as an energy medium. Electronic information technologies (e.g., robotics and word processing) permit mechanization of complex, low-volume tasks formerly too expensive to mechanize. Yet experts expect the greatest gains to come from subsequent linking of individual electronically-mechanized tasks into an integrated unit in which information barriers between tasks are largely eliminated. Again, the unique flexibility of electricity leads to technological progress.

31808 **(ORNL—6131) Nuclear electromagnetic pulse (EMP) protection manual for emergency broadcast radio stations and Emergency Operations Centers.** Crutcher, R.I.; Buchanan, M.E.; Agouridis, D.C.; Clark, D.B.; Gates, R.P. II. (Oak Ridge National Lab., TN (USA)). Jun 1985. Contract AC05-84OR21400. 485p. NTIS, PC A21/MF A01; 1; GPO Dep. File Number DE85013548.

This document presents the information and data required to provide retrofit electromagnetic pulse (EMP) protection for facilities included in the Federal Emergency Management Agency's protection programs. An introduction and orientation to the FEMA program are provided in Section 1. Sections 2 and 3 cover the generation of EMP and its coupling into systems. Section 4 compares natural lightning and EMP. The EMP hardening approach adopted by FEMA is presented in Section 5. Section 6 covers the protection devices, their characteristics, and applications. The facility life-support equipment protection is presented in Section 7. Sections 8, 9, and 10 cover the facility site survey, the survey report, and the protector installation. Maintenance and testing of EMP protectors are discussed in Section 11.

31809 **(SAND—84-2374C) Application of pulsed power in the simulation of severe natural lightning.** White, R.A. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 5p. (CONF-850616—13). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012866.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

Pulsed-power technology has application in the laboratory simulation of severe natural lightning. Several years of successful lightning simulator operation at this facility have confirmed the value of pulsed-power approaches in safety assessment testing, and for evaluating lightning induced hazards and transient effects. Performance capability examples are presented to substantiate the practicality of using crowbarred Marx impulse generators for lightning simulation testing. Severe, double-pulse, direct-stroke environments with continuing current have been applied to full-size aircraft and a variety of other test items. A typical double-pulse test simulation of severe lightning has a first-current peak in excess of 200 kiloamps, a rise time of about one microsecond, and a half-amplitude pulse width of about 200 microseconds.

31810 **(SAND—84-2513C) Impedance effects on anode formation of microparticles in an electron-beam diode.** Gray, E.W.; Rinehart, L.F. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 5p. (CONF-850616—9). NTIS, PC A02. File Number DE85012862.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

Anode interactions in electron-beam diodes cannot be ignored. A second impedance level in a microsecond-pulse, electron-beam diode with a carbon cathode has been identified. Production of spherical microparticles was also observed. These particles range in size from 0.2 to 60 μm diameter and their dimensions obey the Rossin-Rammler (logarithmic extreme probability) distribution. These particles do not appear to be able to penetrate far enough into the vacuum space to participate in the bipolar flow on a μs time scale. However, they can damage the electrode support structures and cause spurious discharges on subsequent operation. Possible formation mechanisms of the spherical particles are presented.

31811 (SAND—84-2578C) Statistical distribution of breakdown voltages in rep-rate spark gaps. Rinehart, L.F.; Buttram, M.T. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 16p. (CONF-850616—6). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012813.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

We have previously shown the correlation of various breakdown voltage distributions with conditions in a rep-rated spark gap. We now extend this study to include effects of a wider range of rep-rates (up to 120 pps), electrode-gas combinations (brass with SF_6 and argon), and gas temperature. We explain the behavior of some of the distributions in terms of basic gas breakdown processes and identify some mechanisms.

31812 (SAND—84-2638C) Explosive generators for low-cost pulsed power. Cnare, E.; Cowan, M. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 22p. (CONF-850616—37). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85013436.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

A practical application of explosive generators (MCGs) is to provide relatively low cost pulsed power at very high energy and power to explore high risk technology. We have developed a new explosive generator design, which we call the Model 632, with which we are attempting to bring the cost of prime pulsed power to 10^{-3} dollars per joule and 10^{-7} dollars per watt. The design allows the use of inexpensive liquid explosive and attempts to minimize labor costs in construction of the armature and coil. In its first test, which was carried out with only one half of the designed initial energy, the Model 632 produced 18 MJ at 0.85 TW. We discuss the results of the first two tests of the Model 632 explosive generator and project the actual cost of pulse power from this source.

31813 (SAND—85-0132) Moment-method formulation of the cavity-probe aperture antenna. Jarem, J.M. (Sandia National Labs., Albuquerque, NM (USA)). May 1985. Contract AC04-76DP00789. 61p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85013264.

The electromagnetic moment-method formulation which can be used to determine the fields in a cavity-probe aperture-ground-plane antenna is given. The formulation consists of the submatrix equations which describe the aperture fields and the submatrix equations which describe the probe currents. The aperture submatrix is derived using reaction matching and K-space theory, and the probe equations are derived using pulse- and modal-function expansions. A simple numerical example of the probe solution is given. Indications of how to couple the probe and aperture fields are given. A complete listing of the cavity Green's functions is given.

31814 (SAND—85-0632C) Transient two-dimensional simulation of SEU in a CMOS SRAM cell. Fu, J.S.; Axness, C.L.; Weaver, H.T. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 6p. (CONF-850711—2). NTIS, PC A02/MF A01; GPO Dep. File Number DE85008419.

From 22. annual conference on nuclear and space radiation effects; Monterey, CA, USA (22 Jul 1985).

Two-dimensional transient simulations of cosmic ion strikes on sensitive junctions of a CMOS SRAM have been carried out. The calculations determine time responses for transport variables of the four cross-coupled transistors and reveal the conditions for change of state or upset. 4 refs., 5 figs.

31815 (UCRL—15676) Evaluation and implementation of testability schemes for gate array integrated circuit design. Final report, February 1-September 30, 1984. Current, K.W.; Edwards, F.; Hayano, S. (California Univ., Davis (USA). Dept. of Electrical and Computer Engineering). 8 Mar 1985. Contract W-7405-ENG-48. 57p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85012874.

The research undertaken involved efforts on two distinct testing problems associated with large-scale (LSI) and very-large-scale (VLSI) integrated circuits. One problem concerns the debugging of chip test set-ups. To help correctly establish and debug chip test set-ups, a chip that generates a unique identifying signal on each of its pads could be useful. Such a chip could drive each wiring connection which could then be sampled. The design, realization, and characteristics of such a "tester" chip are discussed. Also, several "design for testability" schemes for chips are summarized and their potential for use in gate array design procedures is discussed. (LEW)

31816 (UCRL—89176) Numerical modeling of objects near a penetrable interface. Miller, E.K.; Burke, G.J. (Lawrence Livermore National Lab., CA (USA)). Nov 1983. Contract W-7405-ENG-48. 14p. (CONF-830811—21). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013269.

From Conference on quantitative NDE; Santa Cruz, CA, USA (7 Aug 1983).

A numerical approach developed specifically for the antenna-interface problem, but which should be applicable to other problems of this type, is the subject of this paper. It originated from the simple numerical procedure of interpolation, with the intention of achieving a more efficient, yet acceptably accurate, solution. An extension has subsequently been developed to include model-based parameter estimation, and has proven to provide both good accuracy and efficiency for the interface fields. The numerical model used for antennas, involving solution of an integral equation by the method of moments, will be outlined first. Then, the techniques used to reduce computation time for evaluating fields near the interface are described with special attention directed to the differences between the reflected and transmitted field characteristics. Results are included to demonstrate the application of this technique in modeling the detection of buried objects.

31817 Virtual-cathode reflex triode for high-power microwave generation. Burkhart, S.C.; Scarpetti, R.D.; Lundberg, R.L. (Electronics Engineering Department, Lawrence Livermore National Laboratory, P. O. Box 808, Livermore, California 94550). *Journal of Applied Physics;* 58: No. 1, 28-36(1 Jul 1985).

Microwave generation by a relativistic electron beam injected through a screen or foil into a cylindrical waveguide is investigated. The electron beam is generated by a field-emission diode with an anode-cathode gap of ~1 cm. The electron density exceeds the space-charge limit for the beam, which forms a virtual cathode inside the waveguide. The instability of the virtual cathode causes oscillations which couple to bunched reflexing electrons trapped in the potential well. Frequency locking between the oscillating virtual cathode and the reflexing electrons is found to generate a much purer, narrowband microwave output. Using diode mismatch to increase the beam impedance is shown numerically to be a useful technique to improve the microwave generation efficiency and spectral purity. The peak conversion efficiency is calculated to be 2.2% at 7 GHz. The numerical results are compared to experimental results, and the agreement is within 8% in frequency and 25% in peak power. Experimentally, we describe the qualitative effects of different cathode materials and dimensions. The anode materials used were screens and foils of various transparencies and thicknesses. Microwave generation efficiency dropped as the mean scattering angle increased with the thicker foils. Also, the increased transparency of fine screens caused an upward frequency shift due to the increased electron density.

31818 **1000-V, 300-ps pulse-generation circuit using silicon avalanche devices.** Benzel, D.M.; Pocha, M.D. (Lawrence Livermore National Laboratory, Livermore, California 94550). *Review of Scientific Instruments;* **56**: No. 7, 1456-1458(Jul 1985). Contract W-7405-ENG-48.

A Marx configured avalanche transistor string and a pulse rise-time peaking diode are used to generate pulses of >1000 V into a 50-Ω load with rise times of less than 300 ps. The trigger delay of this circuit is about 7—10 ns, with jitter <100 ps. This circuit has been used to generate pulses at a repetition rate up to 5 kHz.

31819 **Simple phase-sensitive detector for Wheatstone bridge resistance measurements.** DiBartolomeo, D.; Klems, J.H. (Applied Science Division, Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Review of Scientific Instruments;* **56**: No. 5, 755-757(May 1985). Contract AC03-76SF00098.

A simple and economical phase-sensitive detector circuit is described. The circuit, which was developed for use with large-area heat-flow sensors that employ resistance temperature detection, uses a synchronous rectifier driven by a square wave. It is shown that the circuit has good linearity, resolution, and immunity to external and internal noise.

31820 **(BPA—319) Characteristics of artificially contaminated metal oxide surge arresters by equivalent fog method and fog method.** Taniguchi, T.; Shibuya, M.; Takahashi, M.; Yamashita, M. (USDOE Bonneville Power Administration, Portland, OR; Denryoku Chuo Research Foundation (Japan)). Mar 1984. Translation source information not available . 38p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012565.

The artificial contamination test of a zinc oxide lightning arrester was conducted using a simple equivalent fog test because the fog test facility was not available to the manufacturer. On one hand, the zinc oxide lightning arrester no longer requires series gaps because of the outstanding nonlinear resistance characteristics of the element. Accordingly, it is said to be superior in contamination proof characteristics. It is also said that washing live lines of insulating tubes is possible. Yet, when the outer surface of the insulating tubes of the zinc oxide lightning arrester is contaminated, uneven distribution of electric potential on the surface of the insulating tubes could cause high electric current to flow into local elements resulting in raised temperature of the elements. This could cause the phenomenon known as thermal runaway. This report attempts to solve the above question by testing the zinc oxide lightning arrester in both the equivalent fog test and the fog test and by attempting a quantitative comparison of the two test methods for the purpose of revealing the true nature of contamination of the tested lightning arrester.

4209 Waste Processing Plants And Equipment

31821 **(ERP/MSL—83-39, pp 1-24) Compost production from municipal wastes of Canadian mining towns.** Jongejan, A. (Canada Centre for Mineral and Energy Technology, Ottawa, Ontario). Mar 1983. NTIS (US Sales Only), PC A11/MF A01. File Number DE85701198. (CONF-8205300—).

From Canadian Uranium Producers' Metallurgical committee meeting; Bancroft, Ontario, Canada (19 May 1982).

Also published as report MRP/MSL-81-73.

A summary of results of experiments on composting municipal wastes, and an overview of a type of composting process that could be used in small Canadian mining towns are given. The process is a means of waste disposal designed to produce compost. Compost can be used for the revegetation of mine-mill tailings as its sorptive properties complement the chemical action of inorganic fertilizers. The possibility of using compost instead of peat in water pollution-abatement processes can be considered. Difficulties that can be expected if a windrow composting process is continued during the low ambient-temperatures of Canadian winters can be avoided by storing the garbage-sewage mixture as hydraulically-compacted briquettes. Degradation of the briquettes takes place during mild-temperature periods without producing the foul odors of heaped garbage. A tentative plan for composting plant is presented as an illustration of the applicatin of the experimental results in a practical process. Because the process is a means of waste disposal, costs have to be divided between the municipality and the mining industry.

31822 **(PB—85-157592/XAB) Pilot-test application for ozone/ultraviolet-light reactor for industrial process water. Final report, 23 April 1982-23 April 1983.** Leitis, E.; Zeff, J.D.; Do, H.G. (Westgate Research Corp., Los Angeles, CA (USA)). 30 Aug 1983. 80p. NTIS, PC A05/MF A01.

This report describes a study to demonstrate on a pilot-plant scale the removal of refractory organic contaminants in an industrial wastewater by ozone in the presence of UV light. This program consisted of (1) selecting an industrial facility which has a wastewater containing refractory organic compounds that prevent the reuse of the water, (2) transporting and installing a UV-ozonation plant at the selected facility, (3) analyzing treated and untreated wastewater samples for the organic contaminants, (4) evaluating pilot plant operating parameters such as wastewater flow rate and ozone dosage, and (5) deriving design data and cost projections for a full-scale UV/O_3 wastewater treatment plant. The experimental results indicated that, UV-ozonation could not be carried out economically without breaking the emulsion beforehand. Pretreatment of the wastewater with slaked lime gave a nearly complete (less than 98%) UV/O3 oxidation of the contaminants.

4210 Combustion Systems

31823 **(AD-A—150355/6/XAB) Size and velocity distributions of particles and droplets in spray-combustion systems. Final report, 1 March 1980-15 August 1984.** Hirleman, E.D. (Arizona State Univ., Tempe (USA). Dept. of Mechanical and Aerospace Engineering). 1 Nov 1984. 153p. NTIS, PC A08/MF A01.

This research was concerned with laser/optical techniques for size and velocity measurements of particles and droplets in spray-combustion systems. The initial efforts were directed toward a novel method for simultaneous size and velocity measurements of individual particles. A prototype instrument was designed, constructed, calibrated, and successfully applied. Our efforts to verify the performance and accuracy of this diagnostic led to a parallel research effort on the laser diffraction droplet sizing technique. Significant contributions to the calibration and scattering inversion aspects of this technique were made. Contributions to the problem of aerosol characterizations are discussed. Among the papers included in this final report are: Integral Transform for Particle sizing by Near-forward Light Scattering; Non-intrusive Laser-based Particle Diagnostics; Particle Sizing by Optical; Nonimaging techniques; Response Characteristics of Laser Diffraction Size Analyzers--Optical sample volume extent and lens effects; Single Beam Laser Velocimetry in Turbulent Flows; Response Characteristics of the Multiple-ratio, Single-particle Counter; and Developments in Non-Doppler Laser Velocimetry.

31824 **(AD-A—150530/4/XAB) Tests of turbulators for fire-tube boilers. Final report, 29 September 1981-31 December 1982.** Junkhan, G.H.; Bergles, A.E.; Nirmalan, V.; Ravigururajan, T. (Iowa State Univ. of Science and Technology, Ames (USA). Heat Transfer Lab.). Oct 1982. 82p. (HTL—29). NTIS, PC A05/MF A01.

Heat transfer coefficients and friction factors were obtained for three turbulator inserts used in fire-tube boilers. An electrically heated flow facility was developed to deliver hot air to a water-cooled steel tube of 2.675-in. i.d. and 71-3/4 in. length. Tube wall temperatures, fluid bulk temperatures, and flow rates were measured. The cooling coil was segmented so that sectional average heat-transfer coefficients could be derived for four regions of the tube. Reference data for the empty tube are in excellent agreement with the usual correlations. Two commerical turbulators, consisting of narrow, thin-metal strips bent and twisted in zig-zag fashion to allow periodic contact with the tube wall, displayed 125 and 157%

increases in heat-transfer coefficients at a Reynolds number of 10,700. Insert orientation had at most a 10% effect on the heat transfer coefficient. A third commercial turbulator, consisting of a twisted strip with width slightly less than tube diameter, provided a 60% increase in heat transfer coefficient. The friction factor increases accompanying these heat transfer coefficient increases were 1110%, 1000%, and 122%, respectively. These data should be helpful in assessing the overall performance gains to be expected when the turbulators are used in actual boilers.

31825 **(AD-A—150593/2/XAB) Initiation, stability, and limits of detonation for advanced stable air-breathing and hybrid-propulsion engine design. Final report, 15 March 1982-14 March 1983.** Wagner, H.G.; Jost, W. (Goettingen Univ. (Germany, F.R.). Inst. fuer Physikalische Chemie). 15 May 1983. 29p. NTIS, PC A03/MF A01.

The influence of orifices on the propagation of flames in tubes was investigated by measuring flame speeds and pressure on both sides of the orifice and by taking smear-camera pictures of the flames passing through the orifice. In addition, the jet-ignition process was stimulated by igniting high speed jets of turbulent unburned gas with electric sparks. Pressure-time profiles and smear-camera pictures give information about the flame speed in gases with very high degrees of turbulence.

31826 **(AD-A—151505/5/XAB) Asymptotic methods especially in combustion. Final report, 15 June 1981-30 September 1984.** Ludford, G.S.S. (Cornell Univ., Ithaca, NY (USA)). Nov 1984. 10p. NTIS, PC A02/MF A01.

Modern asymptotic methods have been applied to a wide range of problems in combustion science as well as certain magnetohydrodynamic and fluid-mechanical questions. Details are contained in the 49 technical reports and 4 Ph.D. theses listed. Topics covered under this contract included: asymptotic methods, combustion, DDT(deflagration to detonation transition) near-stoichiometry, premixed and diffusion flames, droplet burning, stretch resistance, strain effects, effect of pressure variations, dissociation, non-dilute mixtures, wrinkled flames, burner flames, stability, quenching, heat loss, ignition and extinction, Chapman-Jouget limit, polyhedral flames, surface equilibrium, monopropellant, reactive atmosphere, stagnation-point flow, galloping detonations, flame bubbles, solidification fronts, Hartmann layers, intumescent paints, and flickering.

31827 **(AD-A—151814/1/XAB) Design of a Mobile Combustion Diagnostic Fixture (MCDF). Final report.** Devynck, D. (Army Armament Research and Development Command, Aberdeen Proving Ground, MD (USA). Ballistics Research Lab.). Nov 1984. 51p. (BRL-MR—3412). NTIS, PC A04/MF A01.

A Mobile Combustion Diagnostic Fixture (MCDF) was designed. This fixture is intended to be used in connection with chemical-diagnostic techniques in order to provide data on the phenomena involved in the ignition process of the propelling charge in a gun. Special care was taken of the safety of operation of the fixture.

31828 **(LUTKDH/TKKA—7002/1-28/(1982)) Sound propagation in boilers and heat exchangers equipped with sonic sootblowing.** Werthajm, M. (Lund Inst. of Technology (Sweden). Dept. of Chemical Engineering). Sep 1982. 32p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. File Number DE85750830.

The objective of this report is investigation of sound propagation in boilers when the sootblowing by audible sound is used. Sound is generated by means of pneumatic horns operating at 220-370 Hz and 145 dB at 1 m. Sound pressure level and frequency spectrum have been measured at different places in boiler by means of a special probe designed for high temperature. Measurements are discussed and compared with some theoretical models for sound propagation. Method for calculation of corrections for ambient temperature and pressure, as well as the location and acoustical properties of sound source are performed.

31829 **(NASA/CR—3803) Critical review of noise production models for turbulent, gas-fueled burners.** Mahan, J.R. (Virginia Polytechnic Inst. and State Univ., Blacksburg (USA)). Jun 1984. 55p. NTIS, PC A04/MF A01. File Number DE85901308.

A critical review of the combustion noise literature is presented for the period between 1952 and early 1984. The extensive body of literature dealing with feedback-supported combustion oscillations is excluded, as are papers treating all forms of indirect combustion noise, such as entropy noise. Primary emphasis is placed on past theoretical and semi-empirical attempts to predict or explain observed direct combustion noise characteristics of turbulent, gas-fueled burners; works involving liquid-fueled burners are reviewed only when ideas equally applicable to gas-fueled burners are presented. The historical development of the most important contemporary direct combustion noise theories is traced, and the theories themselves are compared and criticized. While most theories explain combustion noise production by turbulent flames in terms of randomly distributed acoustic monopoles produced by turbulent mixing of products and reactants, none are able to predict the sound pressure in the acoustic farfield of a practical burner. The main reason for this failure is the lack of a proven model which relates the combustion noise source strength at a given frequency to the design and operating parameters of the burner. Specific recommendations are given for establishing a benchmark-quality data base needed to support the development of such a model.

31830 **(PB—85-172393/XAB) Application of DRASC method on snecma centers.** (Office National d'Etudes et de Recherches Aerospatiales (ONERA), 92 - Chatillon (France)). 22 Oct 1984. 32p. (In French). NTIS, PC E04/MF E04.

Sponsored by Centre de Documentation de l'Armement, Paris (France). Direction des Recherches, Etudes et Techniques.

ONERA is developing the Raman Anti-Stokes Coherent Diffusion, which makes it possible to make temperature and concentration measurements within flames. This method has already been validated in the case of furnaces or laboratory flames. This test series was the second attempt at using DRASC on a center representative of a combustion chamber in a turboreactor.

31831 **(PB—85-172401/XAB) Behavior of the porous bed in a combustion-deflagration-detonation transition.** Samirant, M.; Lichtenberger, A. (Institut Franco-Allemand de Recherches de Saint-Louis, 68 (France)). 10 Sep 1984. 18p. (In French). (ISL-CO—220/84). NTIS, PC E03/MF E03.

Sponsored by Centre de Documentation de l'Armement, Paris (France). Direction des Recherches, Etudes et Techniques.

This is a follow-up to the conference presented at the 9th DEA Meeting at Unterluess, on the study of the transition combustion-deflagration-detonation in a strongly confined reactive porous medium. The authors review the experimental conditions and the measures taken, as well as the two transition modes observed, one in hexowax, the other in ball powder. They describe for the latter case a special study of the compression of the porous bed.

31832 **(PB—85-176170/XAB) Advanced furnace concepts - commercial unit heater. Annual report, October 1983-September 1984.** Gotterba, J.A.; Schreiber, R.J.; Kesselring, J.P. (Alzeta Corp., Mountain View, CA (USA)). Oct 1984. 101p. (REPT—84-702-110). NTIS, PC A06/MF A01.

See also PB84-179738.

The second year of this planned 2.5-year project was completed. Progress on the first year of the project was described in GRI report 83/0063. The project's objective is to develop an advanced, condensing commercial warm air furnace, or unit heater. The heater will use a gas-fired, low-NOx infrared fiber burner manufactured by the performing organization. In the first of three project phases, it was shown that the retrofit of the burner into a conventional heater resulted in a significant reduction in NOx emissions and noise output. During the second phase, it was determined that a field retrofit of a condensing heat exchanger onto a conventional furnace would not be cost-effective. A prototype of the advanced condensing furnace was then field-tested during the 1983-84 heating season in an industrial plant in Cleveland, Ohio. Significant fuel savings were noted by the user, and the experience gained was applied to the design of the advanced heaters to be tested in Phase 3. Four of these heaters were designed during the Summer of 1984, and fabrication was scheduled for completion in September. Four potential field-test sites in the East and Midwest were identified. Phase 3 will be completed after field testing during the 1984-85 heating season.

31833 **(DTH-LET-RE—83-5) Exergy analyses, aspects of their practical use.** Nielsen, F. (Danmarks Tekniske Hojskole, Lyngby. Lab. for Energiteknik). May 1983. 250p. NTIS (US Sales Only), PC A11/MF A01. File Number DE85750805.

Exergy analyses are a logical and pedagogical thermodynamic tool, which may be used when analyzing and improving the primary energy use of processes. The exergy is defined and the theoretical interpretation and practical application of exergy analyses are discussed. In this connection difficulties, which appear in the practical application of exergy analyses, are described. One difficulty concerns exergy losses, which may be equal in magnitude but very different in character. The characterization of thermal exergy losses is illustrated on two- and five- stage desalination plants. The second of the difficulties in the practical application of exergy analyses, concerns relations between the exergy content of a product and its price. Especially the use of the exergy concept in connection with the distribution of costs of production in cogeneration heat and power plants, which is a common economic problem, is treated. The third of the difficulties in the practical application of exergy analyses, concerns network interactions in process plants. Especially the specific energy- and exergy use of the plant are considered during the parametric changes. The distribution of exergy losses in three semireversible thermodynamic processes at different efficiencies are studied (Carnot-engines and -refrigerators and closed Brayton cycles).

31834 **(CONF-850504—115) Beam intensity increases at the intense pulsed neutron source accelerator.** Potts, C.; Brumwell, F.; Norem, J.; Rauchas, A.; Stipp, V.; Volk, G. (Argonne National Lab., IL (USA)). 1985. Contract W-31-109-ENG-38. 3p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012377.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The Intense Pulsed Neutron Source (IPNS) accelerator system has managed a 40% increase in time average beam current over the last two years. Currents of up to 15.6μA (3.25 x 10^{12} protons at 30 Hz) have been successfully accelerated and cleanly extracted. Our high current operation demands low loss beam handling to permit hands-on maintenance. Synchrotron beam handling efficiencies of 90% are routine. A new H^- ion source which was installed in March of 1983 offered the opportunity to get above 8 μA but an instability caused unacceptable losses when attempting to operate at 10 μA and above. Simple techniques to control the instabilities were introduced and have worked well. These techniques are discussed below. Other improvements in the regulation of various power supplies have provided greatly improved low energy orbit stability and contributed substantially to the increased beam current.

31835 **(FNAL/C—85/59) Tests of orbital dynamics using the Tevatron.** Edwards, D.A.; Johnson, R.P.; Willeke, F. (Fermi National Accelerator Lab., Batavia, IL (USA); Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Apr 1985. Contract AC02-76CH03000. 9p. (CONF-8503105—5). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012296.

From Orbital dynamics and applications to accelerators workshop; Berkeley, CA, USA (7 Mar 1985).

Measurements of Tevatron beam behavior relevant to questions of orbital dynamics are described. General techniques and some preliminary results from phase space distortion experiments are presented. 3 refs., 7 figs.

31836 **(IFVE-OUNK—83-120) IHEP accelerating and storage complex (UNK) status.** Balbekov, V.I.; Dmitrevsky, Yu.P.; Dunaitsev, A.F. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1983. 23p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701059.

The modifications introduced into the accelerating and storage complex (UNK) project due to changes in the ring site during constructing the tunnel underground are described. The results obtained from simulating the UNK basic systems: superconducting and iron magnets of the accelerating system are presented. Nowadays designing the UNK equipment buildings forthe process equipment and those for the UNK power supply units is being terminated. The simulation of the UNK basic elements is being carried out. The beam station at the 200 MHz frequency is under construction. Cryogenic equipment has been simulated and tested. For production of the UNK superconducting elements specialized workshops, including automated equipment for testing and calibration are being constructed. Geological surveying and works on selecting an optimum tunnel location with account for the actual geological layers are nearing the end. Consruction of the southern part of the tunnel is in a preparatory stage, access roads are under construction.

31837 **(INIS-mf—9428) Accelerators and alternative nuclear fuel management options.** Harms, A.A. (McMaster Univ., Hamilton, Ontario (Canada)). 1983. 31p. (CONF-8306262—4). NTIS (US Sales Only), PC A03/MF A01. File Number DE85780938.

From Belgian Nuclear Society annual meeting on advanced uses of accelerators on the nuclear fuel cycle; Brussels, Belgium (13 Jun 1983).

The development of special accelerators suggests the potential for new directions in nuclear energy systems evolution. Such directions point towards a more acceptable form of nuclear energy by reason of the consequent accessibility of enhanced fuel management choices. Essential and specifically directed research and development activity needs to be under taken in order to clarify and resolve a number of technical issues.

31838 **(IPNO-GEPL—83-04) Superconducting coils electromagnet of the Orsay IPN project.** Lafoux, A. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). 1983. 51p. (In French). NTIS (US Sales Only), PC A04/MF A01. File Number DE85751296.

This report describes the K 600 superconducting coils magnet of the cyclotron projected at Orsay. It explains the calculation methods and gives the results. The magnet original characteristics give the possibility to accelerate both protons and heavy ions.

31839 **(JAERI-M—84-032) 2 MeV, 60 kW dual-beam type electron accelerator irradiation facility.** Yotsumoto, Keiichi; Kanazawa, Takao; Haruyama, Yasuyuki; Agematsu, Takashi; Mizuhashi, Kiyoshi; Sunaga, Hiromi; Washino, Masamitsu; Tamura, Naoyuki. (Japan Atomic Energy Research Inst., Tokyo). Feb 1984. 127p. (In Japanese). NTIS (US Sales Only), PC A07/MF A01. File Number DE85701060.

The specification of new irradiation facility which has been constructed from 1978 through 1981 as the replacement of 1st Accelerator of JAERI, TRCRE are described. The accelerator is the Cockcroft-Walton type and both vertical and horizontal accelerating tubes are arranged on a single high voltage generator. Transferring of the high voltage to the horizontal accelerating tube is performed with the high voltage changing system in the pressure vessel. The output ratings of the accelerator are 2 MV of acceleration voltage and 30 mA of beam current. By providing the dual beam system, two irradiation rooms, one for vertical and the other for horizontal beam, are independently operationable. Persons can enter the horizontal irradiation room for experimental setting even when the vertical irradiation room is in operation. The specification of the buildings, the exhaust air treatment system, the irradiation conveyor and the safety observation system are also described.

31857 (KIYI—83-15, pp 10-13) **Automatic system for acquisition of data on the power supply conditions for the cyclotron U-240 magnet.** Linev, A.F.; Sakhno, V.I.; Sokolova, N.A. 1983. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE85780968.

In Modernization of the U-240 isochronous cyclotron in 1982.

Peculiarities of the automatic data acquisition system developed for the U-240 multipurpose isochronous cyclotron are shown. The system constructed on the basis of commercial digital voltmetets, an "Ehlektronika-60 M" microcomputer and a limited set of specially devised devices (analogue commutators of high accuracy, interface) ensures collection of imformation on 32 parameters of the accelerator. The accuracy is determined by the digital voltmeters used and makes up 0.02-0.003% at the system output speed equal to approximately 4 measurements for second. The general algorithms of the operation are given. The system is realized in the form of a rack whereas the devices incorporated in the rack use the constructive features of the "Vishnya" rack.

31858 (KIYI—83-15, pp 14-19) **Operation of U-240 cyclotron in 1982.** Malofeev, A.I.; Ol'khovskij, K.I.; Pashin, V.A. 1983. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE85780968.

In Modernization of the U-240 isochronous cyclotron in 1982.

In 1982 the cyclotron operated on a round-the-clock basis with a working period of 136 hrs per week. The total time of users constituted 3740 hrs per year. Distribution of the time planned for the cyclotron operation and distribution of the time between different regimes of proton-, deuteron- and alpha-particle acceleration are presented in tables. The analysis of the main emergency downtimes of the cyclotron is made. A new radial source of light and heavy ions was installed and accelerated carbon ions were obtained. Work on modernization of the V4-generator equipment, power supply, current stabilization system, desalted waster production and equipment water-cooling systems were conducted. Using the U-240 cyclotron the first batches of radioactive isotopes of iodine and other elements for medical purposes were obtained.

31859 (KIYI—83-15, pp 24-30) **Study of peculiarities of conducting the time-of-flight experiments on U-240 cyclotron.** Kolotyj, V.V.; Isaev, A.G.; Kisurin, K.K.; Maksimov, Yu.K.; Pashin, V.A. 1983. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE85780968.

In Modernization of the U-240 isochronous cyclotron in 1982.

To realize the time-of-flight experiments the time-dependent and structural peculiarities of accelerated particle beams have been investigated. Different ways to obtain time signals unambiguously connected with the ion clusters, that generate neutrons, are considered and investigated. It is shown experimentally that the entrance of particles from several orbits to the outgoing system is possible, and, due to the difference in energies, they will get to the target with a shift in time. Investigations of the time characteristics of the beams have shown that, even without introduction of the phase correction system, it is possible to obtain the time duration of a ion cluster 1.5 ns, whereas the use of the phase autotuning system can ensure the microcluster duration up to 1 ns and the duration of a neutron pulse, respectively.

31861 **(LA-UR—85-1352) Particle-in-cell simulations of the lasertron.** Jones, M.E.; Peter, W.K. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—114). NTIS, PC A02. File Number DE85012698.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The lasertron is a device (either rf or dc) for producing intense, very short, pulsed electron beams (tens of picoseconds). In the dc lasertron, a laser is pulsed repetitively onto a photoemissive cathode. In general, the current is not space-charge limited and follows the laser intensity. The electron pulse is then accelerated out of the device by a constant voltage. By using the laser the need for a subharmonic buncher is eliminated. In the rf lasertron, the diode becomes an rf cavity. This improves the breakdown characteristics of the device, allowing higher voltages to be applied and hence higher currents to be obtained. The calculations are aimed at producing a 10 nC electron beam with an emittance of less than 40π mm-mrad for use in free-electron laser experiments at Los Alamos. Other applications of the lasertron include efficient microwave or rf generation. A class of electrode shapes has been obtained which in the absence of space charge produces no emittance growth. These shapes have been studied with the particle-in-cell simulation model ISIS, and the electrodes which produce minimum emittance including the effect of space charge have been determined. Unique emittance problems associated with the time dependence of the beam pulse are studied and conditions for reducing these effects are discussed. 5 refs., 5 figs.

31862 **(LA-UR—85-1617) Beam-cavity interaction measurements in a DAW structure.** Iwashita, Y.; Schriber, S.O.; Potter, J.M.; Swenson, D.A.; Mavrogenes, G.S. (Los Alamos National Lab., NM (USA); Texas Accelerator Center, The Woodlands; Argonne National Lab., IL (USA); Kyoto Univ. (Japan). Inst. for Chemical Research). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—56). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012660.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

Mode excitations induced by relativistic electron beams have been measured in a disk-and-washer (DAW) structure. The structure had three washers, each with four radial support stems, and half-disk end terminations. The design DAW operating frequency was 1300 MHz, the same as that used to accelerate the electron beam. Both short-pulse (35-ps, 800-Hz, 17-nC/pulse) and long-pulse (10-μs, 2-A average) conditions were used in the beam-excitation experiments. Mode spectra were measured and identified using low-power techniques employed after the high-power beam measurements. Mode frequency calculations for the complete three-washer geometry were performed using URMEL for up to m = 7. Calculated results are compared with data determined from low-power and beam-driven excitation of the DAW structure. 5 refs., 2 figs.

31863 (LA-UR—85-1618) **Revision of and documentation for the standard version of the Poisson-Group codes.** Warren, J.L.; Boicourt, G.P.; Menzel, M.T.; Rodenz, G.W.; Vasquez, M.C. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—62). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012659.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The Los Alamos Accelerator Theory and Simulation Group (AT-6) maintains and distributes a standard version of the Poisson-Group codes (LATTICE, AUTOMESH, TEKPLOT, POISSON, PANDIRA, MIRT, FORCE, SUPERFISH, and SF01). These codes are the product of man-decades of development under the guidance of R.F. Holsinger and K. Halbach. The main applications are in the design of electromagnets (POISSON and PANDIRA) and rf cavities (SUPERFISH). Other applications include electrostatics heat transport, and finding mathematical surfaces of minimum area. With special financial support from DOE-HEP, we have revised and corrected the standard version and are writing a comprehensive manual containing many examples and a summary of the theory behind the codes. This paper will illustrate some of the capabilities of the codes and will summarize the manual. The revised codes are available upon request. 3 figs., 2 tabs.

31864 (LA-UR—85-1619) **High-power rf controls for the NBS-Los Alamos racetrack microtron.** Young, L.M.; Biddle, R.S. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—61). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012658.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The high-power rf system for the National Bureau of Standards (NBS)-Los Alamos racetrack microtron (RTM) uses waveguide power splitters and waveguide phase shifters to distribute rf power from a single 500-kW cw klystron to four side-coupled accelerating structures. The amplitude and phase of each structure is controlled by a feedback system that uses the waveguide variable power splitters, waveguide phase shifters, and klystron drive as the active control elements. A block diagram of this system is shown, as is a subset of the complete system on which the measurements reported in this paper were performed. The feedback controls on the capture section use low-level rf amplitude and phase controls on the rf drive to the klystron. These controls are very fast with an open loop gain bandwidth of approximately 40 kHz. The feedback loop is identical to the feedback loop used in the chopper/buncher system described in another paper at this conference. 4 refs., 8 figs.

31867 (SAND—84-2395C) **Compact, low jitter, triggered spark gap.** Tucker, W.K.; Jones, E.E.; Franklin, T.L.; Bennett, L.F.; Weber, G. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 4p. (CONF-850616—18). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012812.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

High energy particle accelerators using compact, high gradient cavities will require small, highly reliable, triggered spark gaps. This paper will discuss the design and development of V/N triggered spark gaps operating from 520 kV to 1280 kV. Spark gap jitter of <3 ns has been obtained with trigger voltages of 60 kV. Capacitively balancing the trigger blade electrode, coupled with a trigger voltage rise time of 10 ns, produces three or more arcs across the main electrode gaps. A 2.3 Ω injector using 12 parallel spark gaps operating at 1280 kV has been successfully tested. The total number of shots on this injector exceeds 700 without having to refurbish the gaps. A 0.44 Ω accelerating cavity with 24 parallel spark gaps and operating at 520 kV charge voltage has also been tested.

31868 (SAND—84-2412C) **Four stage HELIA experiment.** Ramirez, J.J.; Hasti, D.E.; Corley, J.P.; Poukey, J.W.; Prestwich, K.R.; Spence, P.W.; Smith, I.D.; Schlitt, L.G.; Nishimoto, H.N.; Nielsen, K.E. (Sandia National Labs., Albuquerque, NM (USA); Pulse Sciences, Inc., San Leandro, CA (USA)). 1985. Contract AC04-76DP00789. 15p. (CONF-850616—2). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012026.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

A four stage, 4 MV, 250 kA, 30 ns accelerator to demonstrate the High Energy Linear Induction Accelerator (HELIA) concept is described. HELIA uses modular, water dielectric, pulse forming lines to drive inductively isolated cavities. A cathode stalk extends the length of the accelerator, adds the voltages from the cavities, and delivers the power to a high voltage anode-cathode gap. The cathode stalk constitutes the inner electrode of a coaxial magnetically insulated transmission line (MITL). The outer electrode of the MITL is not continuous but is interrupted at regular intervals by the cavity feeds. The single cavity experiment demonstrated the performance of individual cavities and pulse forming elements. The four cavity experiment demonstrated the key physics issues of the HELIA concept. The design and performance of the pulsed power driver, induction cavities, and measurements of the power delivered by the MITL to an electron beam load are presented.

31869 (SAND—84-2457C) **Kinetic loss experiments on Mite.** Stinnett, R.W.; Woodall, H.N. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 15p. (CONF-850616—7). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012826.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

We have conducted experiments on Sandia National Laboratories' Mite accelerator (2 MV, 4.8 ohms) to study the effect of geometric transitions on power flow in a magnetically insulated power feed. The effect of both changing gaps (electric convolutes) and changing line widths (magnetic convolutes) was studied. These geometric transitions caused electron losses which depended on both the abruptness of the transition and the downstream load impedance. These losses, due to perturbation of the orbits of the magnetically insulated electron flow in the anode-cathode gap, are called kinetic losses. Temporally and spatially resolved measurements of these losses were made using Faraday cups and filtered, 4-chlorostyrene, radiochromic dosimeters. The effect of an anode plasma on magnetically insulated electron flow was also studied. The kinetic losses measured in these experiments can be significant in some situations.

31870 (SAND—85-0035C) **IFA-2 collective ion accelerator experiments.** Olson, C.L.; Frost, C.A.; Patterson, E.L.; Anthes, J.P.; Poukey, J.W. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 16p. (CONF-850504—44). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012358.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

Ion acceleration has now been demonstrated with the IFA-2 collective ion accelerator system. The IFA-2 system is described, photoionization experiments are summarized, and ion results are presented. Using a 1 MeV electron beam and a 30 cm acceleration length, IFA-2 has produced 5 MeV H^+, 10 MeV D^+, and 20 MeV He^{++}. This means that accelerating fields of 33 MV/m over 30 cm have been achieved with a controlled collective accelerator for the first time. 4 refs., 4 figs.

31871 (SAND—85-1133C) **RADLAC technology review.** Miller, R.B. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 10p. (CONF-850504—32). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011995.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

In this paper we review the technology development associated with the RADLAC program. A basic description of the pulsed transmission line approach for constructing high power electron linacs is given, and two examples, RADLAC I and RIIM, are described in some detail. Important problems associated with the design of the high current beam transport line are also discussed. Finally, we describe a recirculating linac concept based on the use of closed accelerating cavities and ionization channel beam transport. 26 refs., 11 figs.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The choice of superconducting materials for accelerator rf cavities has been determined in the past only in part by basic properties of the superconductors, such as the critical field, and to a larger extent by criteria which include fabrication processes, surface conditions, heat transfer capabilities and so on. For cw operated cavities the trend has been toward choosing materials with higher critical temperatures and lower surface resistance, from Lead to Niobium, from Niobium to Nb_3Sn. This trend has been dictated by the specific needs of storage ring cw system and by the relatively low fields which could be reached without breakdown. The work performed at SLAC on superconducting cavities using microsecond long high power rf pulses has shown that in Pb, Nb, and Nb_3Sn fields close to the critical magnetic fields can be reached without magnetic breakdown.

31873 (UM-HE—84-1) **Accelerator physics issues for a superconducting super collider.** Tigner, M. (ed.). (Michigan Univ., Ann Arbor (USA)). 1984. 200p. (CONF-831264—Summ.). NTIS, PC A09/MF A01; 1; GPO Dep. File Number DE85004602.

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

The Workshop took place December 12 through 17 at Ann Arbor, Michigan under the auspices of the University of Michigan. The principal focus of our attention was not on designs but on assessment of the SSC relevant accelerator physics tools, recipes and input data we now possess and to outline how these might be supplemented in order to complete optimized designs and cost estimates. Our survey covered matters germane to bunched and continuous beam pp and p anti p colliders as well as to acceleration of single beams. We assumed in our deliberations that beam energies up to 20 TeV and collider mode luminosities in excess of 10^{33} cm^{-2} sec^{-1} were important desiderata. In very general terms we found that the basic method and data needed for the accelerator physics component of an SSC design are in hand. Foreseeable improvements in design methods and data which will result from further theoretical and experimental work can substantially improve the cost effectiveness of an SSC design.

31874 (UM-HE—84-1, pp 13-17) **Lattice and intersection region optics.** Edwards, D.A.; Steffen, K. (Fermi National Accelerator Lab., Batavia, IL; Deutsches Elektronen-Synchroton DESY, Hamburg, Germany). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

The discussions of the group were divided in a relatively natural way beween two major topics. One related to the interaction regions where experiments were to be located, the other to the arcs of the ring and utility insertions. After some brief remarks about overall ring geometry, we follow this division here, though certain subjects are placed in one category or another in a rather arbitrary fashion.

31875 (UM-HE—84-1, pp 18-24) **Single particle stability.** Cornacchia, M. (Lawrence Berkeley Lab., CA). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

The discussions of the group covered the following topics: (1) magnetic imperfections in superconducting magnets; (2) theoretical models of single particle dynamics; (3) particle tracking; and (4) experimental studies relevant to the SSC project.

31876 (UM-HE—84-1, pp 28-31) **Single particle considerations.** Talman, R. (Cornell Univ., Ithaca, NY). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

Including the introductory section this report contains four sections. Section 2 contains a cursory survey of potentially limiting factors with references to useful information about them. Section 3 contains a discussion of the leading deleterious effect of persistent currents in the dipoles. The chromatic effect of these is so large that we are forced to assume that they will be bucked out by internal correction windings in every dipole. After this systematic effect is corrected for, random magnetic imperfections will remain. Section 4 contains a lattice design prescription for minimizing the sensitivity to magnetic field errors, and with it a presciption for picking the bore minimum imposed by single particle stability considerations.

31877 (UM-HE—84-1, pp 36-41) **Beam channel vacuum system.** Halama, H. (Brookhaven National Lab., Upton, NY). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

The SSC will require two entirely independent vacuum systems. One system will maintain the insulating vacuum for the superconducting magnets at pressures of $<10^{-5}$ torr where gas conduction introduces negligible heat load on the cyrogenic system. Similar systems have been successfully operated in 10^{-7} and 10^{-8} torr ranges at the Tevatron and in CBA full cell tests. No additional problems are envisioned. The second system, known as the Beam Vacuum System, will have to cope with new problems not present in previous proton colliders and its requirements will be treated in some detail in this report. They are: (a) low residual gas molecule density (pressure); (b) low Z/n parameter (low resistivity vacuum chamber with a minimum of discontinuities); and (c) removal of heat due to synchrotron radiation and due to the rf component of the circulating beam (1/2 R/sub s/I^2).

31878 (UM-HE—84-1, pp 42) **Beam cooling and antiproton production.** Collins, T. (Fermi National Accelerator Lab., Batavia, IL). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

This section of the Workshop was organized as a preliminary to the anti p p Workshop at the University of Chicago, February 13, 1984. The report is a preliminary report and the reader is urged to consult the Proceedings of the anti p p Workshop. Our deliberations were confined to a simple, single question: can one generate an anti p beam with sufficient intensity to make anti p p a possible alternate to a pp collider. This question is sharpened by the following: consider six interaction regions, each with $L = 10^{32}$, then anti p are consumed by collisions at a rate of 4.3×10^{11}/hour. If we discard the beam when the anti p intensity drops to one-half, then a production rate of 8.6×10^{11}/hour is necessary. The answer is: one can confidently state that these rates are not only achievable, but very practical using present technology.

31879 (UM-HE—84-1, pp 43) **SPS collider.** Gareyte, J. (CERN, Geneva, Switzerland). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

The main characteristics of the SPS collider are given.

31880 (UM-HE—84-1, pp 45-49) **Tevatron as an SSC prototype; experience versus predictions.** Johnson, R.P. (Fermilab, Batavia, IL). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

Early machine experiments on the Tevatron which are relevant to the SSC are discussed. Despite the preliminary nature of the data, there have been some interesting observations which may influence the design of the SSC. In particular, comparisons of measured betatron tunes, chromaticities, and resonance line widths with those predicted from computer simulations using magnetic field measurements have been made; the predictability for low order phenomena seems acceptable. Coasting beam studies indicate long lifetime and lack of strong resonance driving terms. Low energy studies of beam behavior indicate that a dynamic range of a factor of 15 from injection to operation energy should be possible.

31881 (UM-HE—84-1, pp 86-88) **Survey and alignment requirements and techniques for the SSC.** Norem, J.H. (Argonne National Lab., IL). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

Although in normal operation the beam position in the SSC accelerator will be maintained by position correction magnets, an accurate survey and alignment system is necessary as a guide for civil engineering and initial placement of accelerator components. Because of the size of the machine, the survey system should be fast, reliable, and if possible highly automated. The tolerances for magnet position should be comparable to existing accelerators; a fraction of a mm for quadrupole position relative to the beam axis, and somewhat looser requirements for bending magnets. Over long distances considerable distortion of the circular orbit is tolerable. This paper summarizes the requirements for alignment of accelerator components and lists some techniques presently in use and some which might be useful. More detailed reviews have been made elsewhere. 17 refs.

31882 (UM-HE—84-1, pp 89-92) **Design considerations and procedures for the SSC (with appendix on terrain following).** Teng, L.C. (Fermi National Accelerator Lab., Batavia, IL). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

We outline the rationale, the logistics and procedure for choosing the more crucial parameters of the SSC. The parameter values are given only to illustrate the procedure and do not represent an optimal choice-set for an example design. 5 figs.

31883 (UM-HE—84-1, pp 155-156) **Coupling impedance of position monitor electrodes.** Shafer, R.E. (Fermi National Accelerator Lab., Batavia, IL). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

As the design energy of new machines increases and the beampipe diameter decreases, the upper limit on the longitudinal and transverse coupling impedances for beam stability requirements become lower. It appears now that for a 20 TeV ring with a b = 2.5 cm beampipe that Z_{11}/n is about 1 ohm and Z/sub T/ is about 10^8 ohm/m. (These parameters are of course machine design dependent.) The major sources of these impedances are resistive wall, bellows and step discontinuities, rf cavities, Lambertsons and kickers, and position monitor electrodes. In most cases, careful design and selection of materials can minimize the impedance contribution of individual components. In the case of beam position pickup electrodes, however, the basic design objective is to couple energy out of the beam. Since the nature of this coupling is frequency dependent, the real part of the coupling impedance (i.e., signal power) and the imaginary component (longitudinal stability impedance) are related by causality (the Kramer-Kroenig relation). The purpose of this note is to discuss the basic design of the pickup electrodes, the impedance calculations, and estimates for the Superconducting Super Collider.

31884 (UM-HE—84-1, pp 157-160) **Limitations on beam intensity.** Wenzel, W.A.; Finley, D.; Harrison, M.; Murphy, C.T.; Turkot, F.; Martin, R. (Lawrence Berkeley Lab., CA; Fermi National Accelerator Lab., Batavia, IL; Argonne National Lab., IL). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

Research needs may require several gigajoules of stored beam energy in the SSC. There is no fundamental limitation to operation in this range. A variety of mutually supportive and redundant design features can assure safe operation and reliability of the fast abort and beam dump systems. The stability of operation can depend on details of the superconducting magnet design. The most severe research limitations are anticipated for the conventional fixed target program.

31885 (UM-HE—84-1, pp 172-175) **Feasibility study of stochastic cooling of bunches in the SPS.** Boussard, D.; Chattopadhyay, S.; Dome, G.; Linnecar, T. (CERN, Geneva, Switzerland). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

The average luminosity of the SPS collider could be improved if the slow blow-up of transverse emittances due to beam-beam and intra beam scattering effects were to be reduced by a transverse cooling system. We shall examine the parameters of such a system and propose a technological approach which seems better suited to the case of a few bunches circulating in a large machine.

31886 (UM-HE—84-1, pp 184) **Photoelectron yields from synchrotron radiation in the SSC.** Hseuh, H.C. (Brookhaven National Lab., Upton, NY). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

In the SSC, the synchrotron radiation generated by the circulating beam will liberate photoelectrons from the chamber walls, which in turn will desorb the surface molecules. The photoelectron yields depend on the photon energy and the chamber material. Here we calculate the photon energy distribution of the synchrotron radiation for 20 TeV, SSC with 3 Tesla and 8 Tesla magnets. The total number of photoelectrons produced is calculated using the known photoelectron yield of Al and the photon energy distribution.

31887 **Operation of a plasma focus device as a compact electron accelerator.** Smith, J.R.; Luo, C.M.; Rhee, M.J.; Schneider, R.F. (Naval Surface Weapons Center, White Oak, Silver Spring, Maryland 20910). *Physics of Fluids;* **28**: No. 7, 2305-2307(Jul 1985).

The electron beam produced by a compact plasma focus device has been investigated. The Mather geometry plasma focus electrodes were modified to permit extraction of accelerated electrons. Performance of the plasma focus as an electron accelerator using different gas species and pressures is investigated. Also, results from measurements of the beam parameters are given.

31888 **(LA-tr—85-25) Investigation of the ion source of a neutron tube.** Voitsik, L.R.; Erozolimskii, B.G. Translated from *Trudy, Vsesoyuznyi Nauchno-Issledovatel'skii Institut Yadernoi Geofiziki i Geokhimii ;* No. 1, 144-147(1968). Contract W-7405-ENG-36. 10p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013266. DE85013266

In connection with the necessity of reducing the dimensions of the impulse neutron tube experiments were done to explain the possibilities of reducing the dimensions of the ion source while maintaining a sufficient rate of the ion flow. 1 ref., 4 figs.

31889 **(AD-A—151392/8/XAB) Beam trapping in high-current cyclic accelerators with strong-focusing fields. Memorandum report, January-December 1984.** Sprangle, P.; Kapetanakos, C.A. (Naval Research Lab., Washington, DC (USA)). 6 Mar 1985. 23p. (NRL-MR—5458). NTIS, PC A02/MF A01.

In cyclic induction accelerators, the energy of the particles increases slowly in synchronism with the vertical (betatron) magnetic field. As a consequence of the slow acceleration, the charged particles must be confined by the weak-focusing magnetic field over long periods of time, and thus field errors, instabilities, and radiation losses can impose limitations on the acceleration process. These limitations can be substantially relaxed if the acceleration were to occur rapidly, say over a few microseconds. An appropriate name for such an accelerator is REBA-TRON (Rapid Electron Beam Accelerator). This paper considers a possible mechanism which could trap a high current electron beam in the strong focusing magnetic fields of the rebatron. We investigate a possible mechanism for trapping an intense relativistic electron beam confined by strong focusing fields. In our model the electron beam is assumed to be injected into torsatron fields off axis, near the chamber walls. The finite resistivity of the walls results in a drag force on the beam centroid which may cause the beam to spiral inward towards the axis of the chamber. We have analyzed this mechanism and obtained decay rates for the inward spiraling beam motion.

31890 **(AD-A—151420/7/XAB) Modified betatron accelerator studies. Final report.** Hughes, T.P.; Godfrey, B.B. (Mission Research Corp., Albuquerque, NM (USA)). Dec 1984. 117p. NTIS, PC A06/MF A01.

This final report describes work carried out on the equilibrium and stability properties of circular accelerators. A rigid-disk beam model in which the fields are treated exactly is used to study linear instabilities. This approach has uncovered an important inductive effect which at high toroidal mode numbers leads to either stability or to a hybrid instability. A corresponding effect has been found in electron-layer geometry. The new theory also shows that moving the equilibrium position toward the inner wall can stabilize low mode numbers. With the aid of IVORY code simulation results it is shown that the transverse motion of beam partilces is a key factor in determining beam stability. The upper bound on particle circulation frequency spread is shown to be a function only of the beam major and minor radii. This leads to upper bounds on stable currents in the modified betatron. Numerical results on stability in the stellatron and reversing-solenoidal-lens betatrons are presented. In addition, the sensitivity of equilibrium particle orbits in the stellatron to initial conditions is calculated.

31891 **(ANL-HEP-CP—85-27) Comparison between theoretical predictions and tracking.** Ruggiero, A.G. (Argonne National Lab., IL (USA)). 1985. Contract W-31-109-ENG-38. 38p. (CONF-8503105—3). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012104.

From Orbital dynamics and applications to accelerators workshop; Berkeley, CA, USA (7 Mar 1985).

The beam-beam interaction in a proton-antiproton collider has been an outstanding issue for a long time. Several theoretical predictions have been made in the past which range from the appearance of single beam-beam driven resonances to the onset of stochasticity and Arnold diffusion and the presence of chaotic trajectories. All these effects would cause a limit on the maximum strength of the beam-beam interaction, the so called beam-beam tune-shift, and speculative values have been offered ranging from as low as 0.0005 to as large as a fraction of unit. The lower limit could be caused in a more complicated situation where the external focussing forces which keep the two beams in the same storage ring are also modulated in time. These theoretical predictions have been compared with extensive computer tracking where the motion of the particles is followed turn after turn over very long periods of time. Though it is indeed possible to observe the formation of several resonances, nevertheless the onset of connected stochasticity seems to occur at too large beam-beam tune-shift to be of any practical relevance. Moreover no Arnold diffusion has been observed to have any practical significance. Chaotic trajectories have been found to embed the phase space in disconnected regions of appreciable extension. They increase in numbers considerably when time modulation of external focussing forces is added. 15 refs., 18 figs.

31892 **(CERN-EP—82-214) Phase-space cooling of ion beams.** Moehl, D.; Kilian, K. (European Organization for Nuclear Research, Geneva (Switzerland)). 23 Dec 1982. 25p. (CONF-8210108—4). NTIS (US Sales Only), PC A02/MF A01. File Number DE85900498.

From Detectors in heavy ion physics workshop in memory of Hans Geiger; Berlin, F.R. Germany (6 Oct 1982).

Cooling of proton and antiproton beams has recently led to spectacular results. Amongst these are the increase of the lifetime of stored beams by a factor of 50 due to the compensation of blow-up by multiple scattering on the residual gas; the non-destructive observation of as few as 50 circulating particles (corresponding to a beam current of 3×10^{-11} A), by reducing their frequency spread to less than 10^{-5}; the accumulation of 2×10^{11} antiprotons from batches of about 3×10^{6}; the preparation of sharply collimated beams with a final beam size of less than a millimetre and a momentum spread of 10^{-4} at intensities of 10^{8} to 10^{9} circulating protons. At CERN, these new techniques have made an ambitious programme of antiproton physics possible, covering a large range of energies from almost 0 to 600 GeV/c in the centre of mass and with beams of very high quality. In the light of these achievements and prospects it is natural to consider the application of similar techniques to other rare particles like heavy-ion and/or polarized-particle beams. The use of electron cooling in this context was in fact suggested already some time ago by the Novosibirsk group. In the present paper we try to work out in some detail the features of both stochastic and electron cooling of heavy-ion beams. The problems considered are cooling times, beam lifetime, particle loss due to electron capture, equilibrium states, and possible experimental techniques and applications. 28 refs., 7 figs., 4 tabs.

31893 **(CERN-EP—85-27) Realistic calculations concerning electron cooling in storage rings.** Wolf, A. (European Organization for Nuclear Research, Geneva (Switzerland)). 4 Mar 1985. 20p. (CONF-8409171—3). NTIS (US Sales Only), PC A02/MF A01. File Number DE85900488.

From Workshop on electron cooling; Karlsruhe, F.R. Germany (22 Sep 1984).

This report gives a critical survey of methods available for calculating electron cooling rates in a storage ring. The real conditions of electron cooling are compared with the assumptions commonly made in cooling force calcultions. The relevance of cooling rates and their calculation from cooling forces is discussed. Results of a numerical simulation of electron cooling are presented which include an accurate microscopic description of the cooling force and take into account technical imperfections of the electron cooling device.

31894 **(FNAL/C—85/63) Deprit's algorithm, Green's functions, and multipole perturbation theory.** Michelotti, L. (Fermi National Accelerator Lab., Batavia, IL (USA)). Apr 1985. Contract AC02-76CH03000. 5p. (CONF-8503105—4). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012297.

From Orbital dynamics and applications to accelerators workshop; Berkeley, CA, USA (7 Mar 1985).

Within the context of accelerator multipole theory, we describe a method for solving Deprit's equations using a periodic Green's function. This procedure, implemented in a MACSYMA program, has been applied to a Hamiltonian with a normal sextupole term, and the averaged or renormalized Hamiltonian has been calculated to fourth order in sextupole strength. Anticommutativity of the bracket algebra explains the observed slow growth in the number of induced resonances with order. 3 refs., 1 tab.

31895 **(JINR—1-83-910) Neutral particle 4N channel of Serpukhov accelerator.** Aleev, A.N.; Aref'ev, V.A.; Balandin, V.P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1983. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701062.

The neutral particle 4N channel constructed at Serpukhov accelerator is described. The channel is designed for high energy neutron beam production. The neutron beam has the following characteristics: average energy of neutrons is (40+-5) GeV, intensity - approximately 10^6 neutrons/cycle over 10^{11} protons striking onto internal target, impurity of charge particles -about 2%, beam dimensions - 50 mm horizontally, 60 mm vertically (in the region of BIS-2 spectrometer). Zn-beam experiments on the search for charmed particles and narrow baryon resonances in hadron-hadron interactions have been successfully performed during several years by means of BIS-1, BIS-2 spectrometers.

31896 **(JINR—9-84-129) Calculation of some characteristics of the beam dynamics in the central region of the U-400 cyclotron.** Korman', Z. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions). 1984. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701063.

The ion motion in the central region of the four-meter isochronous cyclotron for the second harmonic mode acceleration is studied. Measured data of the real magnetic field of the cyclotron and calculated three-dimensional electric field of the dees have been used while calculating. The disadvantageous effects of the transverse electric field are shown, which effect particle motion in the beginning of the second turn. The possibility of improvement of the beam quality by screening this region from the electric filed was investigated. The modification leads to the better centering of orbits and increase of vertical acceptance of the geometry approximately by 2.5 times.

31897 **(JINR—R-11-83-893) Two-dimensional magnetic field numerical simulation of 3 T superconducting dipole with iron yoke.** Borisovskaya, Z.V.; Zhidkov, E.P.; Kuts, I.V.; Polyakova, R.V.; Shelaev, I.A.; Yudin, I.P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy; Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1983. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701061.

A numerical investigation of a possibility to get an acceptable technological configuration of superconducting (SC) dipole that provides high-homogeneous 3 T field is carried out. The dependence of the field nonlinearity with a value of B induction is received. Two types of SC dipoles with rectangular aperture are compared. Two methods of two-dimensional magnetic field simulation in the magnets with rectangUlar aperture are compared. These calculations have been performed using POISSON and MIC2M programs. The results indicate that this SC dipole configuration provides the 3 T value of high-homogeneous field in the magnet aperture, while the magnet induction inside the yoke does not exceed 2.1 T.

31898 **(LA-UR—85-1526) Rf program for LAMPF II.** Colton, E.P. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—120). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012693.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The rf program is chosen to maintain a bucket/bunch area ratio of at least two during rf capture, acceleration, injection, and extraction. At 0.797 GeV the beam bunch area is 0.0635 eVs. We show the behavior of the rms bunch length and dp/p during acceleration. The rf system must provide a voltage of 1.59 MV/turn for the booster and 5.0 MV/turn for the main ring. 7 refs., 5 figs.

31899 **(LA-UR—85-1528) Measurement and resulting first and second order approximations for a 9 degree bending magnet in LAMPF's 750-keV transport.** Hurd, J.W. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—118). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012691.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The three Cartesian components of magnetic field are measured for a 9 degree bending magnet. Measurement errors are corrected and the data is fit to a polynomial which satisfies Maxwell's equations. Particle paths through the magnet are calculated by numerical integration and the corresponding first and second order particle transformation matrices are generated. A parameterization for the first order transformation matrix is developed and the resulting approximations for predicting particle motion in the magnet are compared to the results of the numerical integration.

31900 **(LA-UR—85-1610) Cw operation of the FMIT RFQ accelerator.** Cornelius, W.D. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 7p. (CONF-850504—46). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012667.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

Recently, we have achieved reliable cw operation of the Fusion Materials Irradiation Test (FMIT) radio-frequency quadrupole (RFQ) accelerator. In addition to the operational experiences in achieving this status, some of the modifications of the vacuum system, cooling system, and rf structure are discussed. Preliminary beam-characterization results are presented. 10 refs., 8 figs.

31901 **(LA-UR—85-1615) Noninterceptive techniques for the measurement of longitudinal parameters for intense H^- beams.** Cottingame, W.B.; Boicourt, G.P.; Cortez, J.H.; Higgins, W.W.; Sander, O.R.; Sandoval, D.P. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—53). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012662.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

With increasing brightness, beam diagnostic techniques requiring interception of the beam become impractical. For H^- particle beams, solutions for this problem based on the phenomenon of photodissociation are currently under investigation at the Los Alamos National Laboratory accelerator test stand (ATS). A laser can be used to selectively neutralize portions of the beam that can be characterized after the charged particles have been swept away. We have used this technique for the measurement of current density versus longitudinal phase and the longitudinal phase-space distribution at the output of the ATS radio frequency quadrupole (RFQ). The results of our measurement are compared with the predictions of the particle-dynamics code, PARMTEQ. 2 refs., 6 figs.

31902 **(LA-UR—85-1622) Relation between field energy and RMS emittance in intense particle beams.** Wangler, T.P.; Crandall, K.R.; Mills, R.S.; Reiser, M. (Los Alamos National Lab., NM (USA); Maryland Univ., College Park (USA)). 1985. Contract W-7405-ENG-36. 6p. (CONF-850504—58). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012655.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

An equation is presented for continuous beams with azimuthal symmetry and continuous linear focusing, which expresses a relationship between the rate of change for squared rms emittance and the rate of change for a quantity we call the nonlinear field energy. The nonlinear field energy depends on the shape of the charge distribution and corresponds to the residual field energy possessed by beams with nonuniform charge distributions. The equation can be integrated for the case of an rms matched beam to yield a formula for space-charge-induced emittance growth that we have tested numerically for a variety of initial distributions. The results provide a framework for discussing the scaling of rms emittance growth and an explanation for the well-established lower limit on output emittance. 15 refs., 4 figs.

31903 **(LA-UR—85-1654) Considerations on collective ion acceleration as an intense ion injector.** Faehl, R.J.; Peter, W.K. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 11p. (CONF-850504—90). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012706.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

A virtual cathode collective acceleration configuration is examined for use as a pulsed, intense ion injector. Numerical calculations of the collective acceleration have shown peak ion energies of several times that of the electron beam energy. This is consistent with a variety of experiments. The late time behavior is to accelerate ions to lower energies but at a higher current. This is characteristic of a reflex ion triode, which produces an ion beam largely charged but not current neutralized. Dynamic neutralization must be achieved if accelerator applications requiring transport and focusing are to be realized. Representative applications have been simulated and are discussed. 10 refs., 6 figs.

31904 **(LA-UR—85-1682) Transverse emittance of a 2.0-MeV RFQ beam with high brightness.** Sander, O.R.; Boicourt, G.P.; Cottingame, W.B. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—86). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012718.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

One major purpose of the accelerator test stand (ATS) is to see if particle simulation codes can correctly predict the output beam parameters of our radio-frequency quadrupole (RFQ) linac. By injecting a very bright 100-keV beam (100 mA, 0.02 π x cm x mrad) and comparing the measured output beam parameters with those predicted (using PARMTEQ), we can investigate PARMTEQ's performance in a high space-charge regime. PARMTEQ has successfully simulated the RFQ beam transmission and energy distribution; it is more difficult to simulate output transverse emittance. Transverse emittance is also difficult to measure because of the high-power-density beam. Special modification of our interceptive slit and collector equipment was required. This paper will compare measured transverse emittances with those predicted. 3 refs., 7 figs.

31905 **(N—85-16728) (20)Ne interaction in extended matter.** Wilson, J.W.; Townsend, L.W. (National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center). Dec 1984. 16p. (NASA-TM—86312). NTIS, PC A02/MF A01.

Although heavy ion transport theory is developed to a relatively advanced stage, the present limitation in biomedical and electronic applications is the uncertainty in nuclear fragmentation parameters. The present status on Ne-20 beams is discussed and useful formulae are presented for future use in analysis of beam transport experiments.

31906 **(NIIEFA-P-B—0587) Betatron oscillation frequency shift in large cyclic accelerators.** Belov, V.P. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)). 1983. 20p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701064.

The effect of magnetic field nonlinearities on the betatron oscillation frequency shift in large cyclic accelerators taking into account the closed orbit distortions is considered. Rather compact formulae connecting the frequency shift with the arbitrary order magnetic field nonlinearity amplitude for a beam with arbitrary emittance and dispersion are obtained. Testing calculations of magnetic field nonlinearity tolerances in the first stage of the accelerating storage complex are carried out.

31907 **(SAND—84-2398C) Vacuum interface flashover with bipolar electric fields.** Tucker, W.K.; Anderson, R.A.; Hasti, D.E.; Jones, E.E.; Bennett, L.F. (Sandia National Labs., Albuquerque, NM (USA)). May 1985. Contract AC04-76DP00789. 13p. (CONF-850616—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012027.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

High energy, compact, particle accelerators require accelerating cavities that have large gradients and operate with high efficiency. The bipolar electric fields required in these efficient accelerating cavities place severe requirements on the vacuum interface. Experimentally, we have found that the bipolar flashover field varies as t/sup -1/2/ for times out to 300 ns and then remains essentially constant at 33 kV/cm for longer duration waveforms, whereas materials subjected to unipolar electric fields follow a t/sup -1/6/ relationship. Furthermore, specific accelerating cavities offer enhancements that may be employed to achieve highly uniform electric fields across the vacuum interface. Using these results and the results of a previously developed theory of unipolar flashover, a new interface has been designed and 50 kV/cm bipolar flashover field achieved for a waveform train that lasted 1 μs. This paper will discuss the design of this vacuum interface and the evaluation of various materials that led to achieving bipolar flashover fields 50% greater than we had previously obtained for long duration waveforms. 10 refs., 6 figs.

31908 **(SAND—84-2421C) Measurement and interpretation of electron angle at MABE beam stop.** Sanford, T.W.L.; Coleman, P.D.; Poukey, J.W. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 4p. (CONF-850504—37). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011918.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

This analysis shows that radiation measurements combined with a sophisticated simulation provides a simple but powerful tool for estimating beam temperature in intense pulsed annular electron-beam accelerators. Specifically, the mean angle of incidence of a 60 kA, 7 MeV annular electron-beam at the beam stop of the MABE accelerator and the transverse beam temperature are determined. The angle is extracted by comparing dose profiles measured downstream of the stop with that expected from a simulation of the electron/photon transport in the stop. By calculating and removing the effect on the trajectories due to the change in electric field near the stop, the beam temperature is determined. Such measurements help give insight to beam generation and propagation within the accelerator. 9 refs., 6 figs., 1 tab.

31909 **(SLAC-PUB—3621) Rf beam deflection measurements and corrections in the SLC linac.** Seeman, J.T.; Ross, M.C.; Sheppard, J.C.; Stiening, R.F. (Stanford Linear Accelerator Center, CA (USA)). Apr 1985. Contract AC03-76SF00515. 3p. (CONF-850504—111). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013061.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The requirements of rf acceleration in the SLC linac to produce high energy beams are complicated by the presence of small transverse rf beam deflections which arise from several sources. These rf deflections place stringent tolerances on the phase and amplitude stability of the klystrons. They also force the use of special magnetic bumps to correct the trajectories of oppositely charged beams that will pass down the linac. If left unabated, rf deflections can limit the performance of the SLC. There are several methods to reduce the deflections. Many measurements of rf deflections have been made in the low energy part of the linac where the beams are most sensitive. 4 refs., 8 figs., 2 tabs.

31910 **(SLAC-PUB—3640) High resolution beam profile monitors in the SLC.** Ross, M.C.; Seeman, J.T.; Jobe, R.K.; Sheppard, J.C.; Stiening, R.F. (Stanford Linear Accelerator Center, CA (USA)). Apr 1985. Contract AC03-76SF00515. 3p. (CONF-850504—66). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013375.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

In the SLC linac, low emittance beams with typical transverse dimensions less than 0.2 mm must be accelerated without effective emittance growth. In order to monitor this we have installed a high resolution beam profile monitor system which consists of an aluminum target covered with a fine-grained phosphor, a magnifying optical system, a television camera and video signal recording electronics. The image formed when the beam strikes the phosphor screen is viewed on a CRT monitor at the console and selected horizontal and vertical slices of the beam spot intensity are recorded. A 20 MHz transient waveform recorder is used to sample and digitize the raw video signal along the selected slice. The beam width is determined by fitting the background subtracted data to a Gaussian. Beam spots less than 6 x 3 mm can be viewed. Beam spot sizes σ/sub x,y/ < 80 μm have been measured. 9 refs., 4 figs.

31911 **(SLAC-PUB—3673) Observations of accelerated high current low emittance beams in the SLC Linac.** Seeman, J.T.; Ross, M.C.; Sheppard, J.C.; Stiening, R.F. (Stanford Linear Accelerator Center, CA (USA)). May 1985. Contract AC03-76SF00515. 4p. (CONF-850504—85). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013073.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The Linac of the SLAC Linear Collider (SLC) is required to accelerate several intense single electron and positron bunches to high energy while not enlarging their small transverse emittances. The improvements needed by the SLAC Linac to meet these goals have very stringent design criteria. As partial systems have become available, beam tests have been performed to confirm the designs. The results of those beam tests are discussed. Future plans of the improvement program are described. 13 refs., 9 figs.

31912 **(UCRL—15660) High brightness cathode experiments on the experimental test accelerator (ETA). Final report.** Schlitt, L.; Proulx, G. (Pulse Sciences, Inc., San Leandro, CA (USA)). 1984. Contract W-7405-ENG-48. 69p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85012958.

The experiments performed on the ETA during the months of September through October of 1984 were intended to accomplish two objectives; to discover or develop a source capable of producing an electron beam whose brightness is substantially higher than that of previous sources, and to determine, if possible, the mechanisms which limit the source brightness so that further enhancements might be obtained. The results of the experiments met these objectives to a limited degree. A cathode material (velvet) and a diode geometry were identified which resulted in more than a factor of two improvements in brightness over that obtained with previous flashboard cathodes. Experiments were performed which have yielded information about mechanisms which may limit beam brightness, and have suggested approaches for further work to improve brightness. However, the desired brightness of 10^5 A/(cm^2-rad^2) was not achieved in these experiments. This report contains a discussion of the cathodes used, the diode geometries employed, the diagnostics, the typical characteristics of a single beam experiment, and the characteristics of the collimator used to measure the brightness. The entire ensemble of brightness data is presented and broken down into classes of experiments. In addition, the results of an EBQ calculation of one diode geometry are discussed, and differences between the results of similar experiments on ETA and ATA are noted. Finally, conclusions and recommendations are presented.

31913 **(UCRL—91936) Technology of magnetically driven accelerators.** Birx, D.L.; Hawkins, S.A.; Poor, S.E.; Reginato, L.L.; Rogers, D. Jr.; Smith, M.W. (Lawrence Livermore National Lab., CA (USA)). 26 Mar 1985. Contract W-7405-ENG-48. 21p. (CONF-850504—33). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011857.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The marriage of Induction Linac technology with Nonlinear Magnetic Modulators has produced some unique capabilities. It appears possible to produce electron beams with average currents measured in amperes, at gradients exceeding 1 MeV/meter, and with power efficiencies approaching 50%. A 2 MeV, 5 kA electron accelerator has been constructed at the Lawrence Livermore National Laboratory (LLNL) to demonstrate these concepts and to provide a test facility for high brightness sources. The pulse drive for the accelerator is based on state-of-the-art magnetic pulse compressors with very high peak power capability, repetition rates exceeding a kilohertz and excellent reliability. 8 figs., 1 tab.

31914 **(UM-HE—84-1, pp 5-12) Primary parametric relationships.** 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

High luminosity will be necessary for the study of many of the new phenomena expected in the SSC energy region. Particle detectors, however, are limited in the number of simultaneous interactions which they can handle, and thus need a good duty cycle with collisions spread out in time to the greatest extent possible. To avoid the larger number of stored protons now thought to be required for continuous beams, we have considered bunched beams of protons crossing at a small angle. Plots are given of the dependence on bunch separation of the emittance, number of protons, etc., needed for 10^{33}cm^{-2}sec^{-1}. In order to minimize the number of stored protons ($\sim 10^{14}$/ring), an emittance roughly ten times smaller than that presently achieved at high energies is required for a bunch separation of 6 meters (20 nsec).

31915 **(UM-HE—84-1, pp 25-27) Single beam collective effects in the SSC.** Siemann, R.H. (Cornell Univ., Ithaca, NY). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

Crucial issues for this Workshop are evaluations of our ability to calculate the important impedances ab initio and to use them to predict all instability thresholds accurately. That this is important is seen by estimates which indicate that for typical SSC parameters, we need (Z/sub parallel//n) $\leqq$ 1 ohm. Such low impedances have been achieved in electron machines purposely so designed. Impedance computations have been performed for these cavity dominated electron storage rings and have used in conjunction with numerical simulations to explain observed single beam instabilities. There is a strong interaction between theoretical and computer simulation development and measurements made in accelerators. During the discussion of the issues, measurements that are needed will be pointed out. 22 refs.

31916 **(UM-HE—84-1, pp 32-33) Magnet imperfections and collective effects.** Palmer, R. (Brookhaven Natioal Lab., Upton, NY). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

The random sextupole field variations in the magnets assumed in the above analysis were 1.7 m^{-2} for a small SSC magnet with 3.5 cm inside coil and 7 m^{-2} for a very small SSC magnet with coil inside diameter of only 1.5 cm. These values were obtained from an analysis of observed fluctuations in the CBA magnets. This analysis revealed two components in the magnet errors. The first component arises from fixed mechanical errors due to punching accuracy or machining accuracies in wedges, pole spaces, etc. Multipole effects from such errors will be relatively greater as the mean coil diameter is made smaller, and in fact would be expected to increase as the inverse cube of that radius. The other type of error arises from fractional or angular deviations such as would arise from non-uniformity in conductor thickness. Such errors will increase only as the inverse square of the mean coil radius.

31917 (UM-HE—84-1, pp 34-35) **Rf and feedback systems.** Lambertson, G. (Lawrence Berkeley Lab., CA). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

At the outset of the group's work, presentations and discussions served to introduce participants to the SSC features defining the RF system requirements and to the limited design work done up to that time. Following that, the group: (1) developed example parameters for an rf system; (2) discussed the evaluation of rf noise problems; and (3) considered the nature of feedback systems for control of both longitudinal and transverse beam excursions and instabilities. We acknowledge valuable discussions paricularly with members of the stability group.

31918 (UM-HE—84-1, pp 56-57) **Beam-beam resonance criteria for high Q/sub s/ and low crossing angles.** Peggs, S. (CERN, Geneva, Switzerland). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

Suppose that the SSC has a tune modulation of amplitude Q at a frequency Q/sub s/, for example through non-zero chromaticity and energy spread. Near a one-dimensional beam-beam resonance of order N this leads to synchrobetatron sidebands. If the sidebands overlap (the Chirikov-Courant criterion), chaos ensues, but only in this amplitude range. For given collision strengths chaos occurs if the band is above a critical amplitude a/sub c/. Lower amplitude particles are inherently more stable against beam-beam resonances.

31919 (UM-HE—84-1, pp 58) **Beam-beam resonance suppression by clustered IR's.** Peggs, S. (CERN, Geneva, Switzerland). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

If there are m collisions in the SSC, a resonant vector is associated with the i'th collision. The resonance is suppressed if the vector sum disappears.

31920 (UM-HE—84-1, pp 59) **Intra-beam scattering with vertical dispersion.** Piwinski, A. (Deutsches Elektronen-Synchrotron DESY, Hamburg, Germany). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

Without vertical dispersion the intra-beam scattering would reduce the beam height in large storage rings as the SPS Collider or the SSC. A spurious vertical dispersion, however, is inevitable. It is caused by orbit errors in quadrupoles and sextupoles, and therefore increases with increasing number of quadrupoles and sextupoles, i.e. it will be large in large storage rings. The following formulae show that even a small vertical dispersion leads to an increase of the beam height.

31921 (UM-HE—84-1, pp 60-62) **Polarized protons in the SSC.** Terwilliger, K.M.; Krisch, A.D.; Courant, E.D.; Cho, Y.; Martin, R.L.; Ruth, R.D.; Steffen, K.; Teng, L.C.; LaClare, J.L. (Univ. of Michigan, Ann Arbor; Brookhaven National Laboratory, Upton, NY; Argonne National Lab., IL; Lawrence Berkeley Lab., CA; DESY, Hamburg, Germany). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

The Polarized Proton Sub-Group discussed the feasibility of a polarized proton capability in the SSC, and the additional machine requirements that would be necessary. Although the 10^3 extrapolation from present polarized proton accelerator energies requires caution in any recommendations, in our brief study we found no problems that would preclude obtaining polarized colliding beams in the SSC. Achieving polarization capability will require some restrictions on the machine design to allow the addition of perhaps 20 "Siberian Snakes" of about 18 Tesla-meters each to avoid beam depolarization; space for these snakes should be provided in the lattice. Vertical deflection of the beam should also be avoided if possible, since the resulting depolarization might be difficult to undo. Thus polarization would probably be in conflict with the vertical orbit distortion inherent in a "terrain following" SSC. Maintaining beam polarization during acceleration through the booster stages could be achieved with conventional resonance crossing methods such as pulsed quads, spin flips, correction dipoles, and snakes at the higher energies. An additional low energy accumulator ring booster system might be required to bring the polarized beam intensity up to the unpolarized beam level. Asymmetries in high-P_1 inclusive or elastic reactions are potential candidates for polarimeters at multi-TeV energies.

31922 (UM-HE—84-1, pp 67-68) **Note on reversible dispersion matching with arbitrary phase advance.** Helm, R.H. (Stanford Univ., CA). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.). Contract AC03-76SF00515.

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

This note describes a reversible dispersion matching system with arbitrary phase advance per cell. Reversible means that the match is independent of the sign of the quadrupoles. The method includes several well-known missing-magnet and reduced-magnet schemes as special cases.

31923 (UM-HE—84-1, pp 69-72) **LHC insertions with offset quadrupoles.** Hutton, A. (European Organization for Nuclear Research, Geneva, Switzerland). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

A new style of insertion for proton-proton colliders is proposed. By offsetting the quadrupoles, they can be used both for focusing and for separating the beams. This insertion can provide at least twice the luminosity of that of the previous proposals.

31924 (UM-HE—84-1, pp 78-82) **SSC closed-orbit correction.** Moore, C.; Murphy, T.; Norem, J.; Zisman, M. (Fermi National Accelerator Lab., Batavia, IL; Argonne National Lab., IL; Lawrence Berkeley Lab., CA). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.). Contract W-31-109-ENG-38;AC02-76CH03000;AC03-76SF00098.

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

Because of its large size (~ 100 km circumference), survey, alignment, and closed-orbit correction of the SSC will be challenging tasks. For example, the fact that the accelerator will have as small a magnet aperture as practicable means that the closed-orbit corrections must be very precise. A preliminary estimate, however, suggested that the closed-orbit errors may be quite large and difficult to correct properly. In this paper we attempt to estimate the expected magnitude of closed-orbit errors in the SSC, and the corrector strengths required to compensate for them. Formulae for closed-orbit deviations are parametrized here in such a way that they can be applied easily to the various lattice examples that presently exist and to those that will undoubtedly be generated in the future. To give a feeling for the magnitude of the various terms, a few numerical examples based on the 6.5 T LBL lattice are presented. Scaling to other "personal favorites" should be straightforward. Recent experience at Fermilab concerning the alignment and closed-orbit correction scheme in the Energy Saver/Doubler are discussed as a guide to the practical aspects of what can be achieved at an operating superconducting accelerator.

31925 (UM-HE—84-1, pp 119-123) **Conductor placement errors to Tevatron dipoles and quadrupoles and an extrapolation to SSC dipoles.** Fisk, H.E. (Fermi National Accelerator Lab., Batavia, IL). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

Multipole rms moments are calculated for angular displacements of conductor blocks for ironless dipoles and quadrupoles. Under the assumption that two rms angles are important, one for coil matching and one for overall angular deviation, the sigmas of the lower harmonic moments for Energy Doubler/Saver magnets can be compared. The conclusion is that coil matching is done to an accuracy of 0.5 to 0.75 mr (1.0 to 1.5 mils) and that conductor blocks are placed to 0.85 to 1.4 mr in angle (1.7 to 2.5 mils). If, in reducing the radius of the conductors for an SSC magnet, the angular placement errors are comparable, then the SSC moment distributions will also be comparable at 2/3 of the inner conductor radius.

31926 (UM-HE—84-1, pp 124-125) **Calculations of the dynamic aperture at the Tevatron.** Gelfand, N.M. (Fermi National Accelerator Lab., Batavia, IL). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

The dynamic aperture of the Tevatron has been calculated using the tracking program TEVLAT written by A. Russell. It is possible within TEVLAT to specify the magnetic coefficients up to b_8 and a_8 for each individual dipole and quadrupole in the lattice. In the case of dipoles the higher moments up to n = 14 are approximated, in calculating the non-linear effects, by the average values over all the dipoles. (This constraint is imposed by the limits on the available memory in the Fermilab Cyber. We do not believe that this approximation affects the results presented here.) Because TEVLAT allows the low order moments to be specified for each magnet individually it is possible to use the MTF measurements on the magnets and study the effect the ordering of the magnets in the lattice has on the dynamic aperture. 4 figs.

31927 (UM-HE—84-1, pp 139-143) **Estimate of the longitudinal and transverse impedances for the superconducting super collider.** Ng, K.Y. (Fermi National Accelerator Lab., Batavia, IL). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

We try to estimate the longitudinal impedance per harmonic Z/sub L//n as well as the transverse impedance Z/sub T/ for the 20 TeV Superconducting Super Collider (SSC). Effects due to space charge, wall resistivity, bellows, monitor plates, and synchrotron radiation are considered. The resulting Z/sub L//n and Z/sub T/ are plotted. Such a knowledge of z/sub L//n and Z/sub T/ is necessary in computing the limits of many types of instabilities for the bunched beam. To be more specific, in our estimation, we consider the special case of an injection energy of 1 TeV and assume a maximum field of 5 Tesla in the SSC dipoles, or E (maximum) = 20 TeV, γ/sub P/ (maximum) = 21315.6, E (injection) = 1 TeV, γ/sub P/ (injection) = 1065.78, B = 5T, rho = radius of curvature = 13.345 km. Our results show that when monitor plates matched at both ends (such as the ones used in the Tevatron) are used, their effects dominate both Z/sub L//n and Z/sub T/.

31928 (UM-HE—84-1, pp 147-148) **How much random sextupole field can we have in the presence of beam-beam interactions.** Ohnuma, S. (Fermi National Accelerator Lab., Batavia, IL). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

During the workshop, two estimates of the random sextupole components in the SSC dipoles have been presented, one from Berkeley and the other from Brookhaven. In the CERN SPS, beam studies on the anti p lifetime have been performed with p and anti p bunches separated by means of electrostatic separators. We may conclude that, if the beam-beam interaction is comparable in the SPS and SSC (that is, linear tune shift = .003/interaction, total 0.2), the SSC at 20 TeV with the Berkeley sextupole errors seem safe. The Brookhaven sextupole errors may be on the borderline.

31929 (UM-HE—84-1, pp 149-150) **Width of nonlinear resonance.** Ohnuma, S. (Fermi National Accelerator Lab., Batavia, IL). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

Two approximations are made, one essential and the other not so essential but convenient to keep the analytical treatment manageable: (1) only one nonlinear resonance is considered at a time so that the treatment is best suited when the tune is close to one resonance only. To improve this approximation, one must go to the next order which involves a canonical transformation of dynamical variables. Analytical treatment of more than one resonance is not possible for general cases; (2) in the formalism using the action-angle variables, the Hamiltonian can have terms which are independent of the angle variables. These terms are called "phase-independent terms" or "shear terms." The tune is then a function of the oscillation amplitudes.

31930 (UM-HE—84-1, pp 161-165) **Determination of the dynamic aperture of circular accelerators by the perturbation theory method.** Willeke, F. (Fermilab, Batavia, IL). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

An analytical method for finding the dynamic aperture is presented, which is based on the canonical perturbation theory. The nonlinear Hamilton function is transformed resulting in terms of 3rd order in the nonlinear field keeping only the detuning terms in first and second order. The new Hamilton function is constant if the third order terms are neglected. The phase trajectories resulting from the constant hamiltonian are transformed back into the original coordinates x, x′, y, y′. The dynamic aperture is extracted from the maximum linear phase ellipse which fits in the distorted phase areas. The procedure is applied to two examples, the TEVATRON and the SSC.

31931 (UM-HE—84-1, pp 166) **Aperture requirements for the beam position monitor and closed orbit distortions.** Shafer, R. (Fermi National Accelerator Lab., Batavia, IL). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

We assume that a beam position monitor (BPM) system comparable to the system installed in the Tevatron could be used for the 20 TeV rings. In brief, the Tevatron BPM used directionally sensitive transmission line type pickups which are capable of measuring the position of a single bunch of about 3 x 10^9 protons to +-300 microns on a single pass. The BPM system also provides beam intensity information simultaneously. The basic operating principle is for the signals from the passing beam bunch to shock excite bandpass filters (Q about 10) which ring for a sufficient number of cycles to allow measurement of the relative signal amplitudes by means of amplitude-to-phase conversion. The period of the oscillation should be equal to, or a harmonic of the bunch spacing. Unlike electrostatic pickups, this design is non-resonant and therefore presents a minimal relatively flat (z/n) to the beam.

31932 (UM-HE—84-1, pp 171) **Note on aperture limits from collective instabilities.** Keil, E. (CERN, Geneva, Switzerland). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

The calculation covers transverse and longitudinal microwave instability, and transverse mode coupling instability. (GHT)

31933 (UM-HE—84-1, pp 176-180) **RF noise considerations for the superconducting super collider.** Chattopadhyay, S. (CERN, Geneva, Switzerland). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

The purpose of this note is to provide a preliminary study of some scaling laws and relevant criteria, based on some already existing analyses, for the RF noise and feedback effects, that may affect the beam life-time and its stability properties in large hadron colliders like the SSC. Experience at the only operating hadron collider at present, Sp anti pS at CERN, provides the necessary theoretical and experimental data-base potentially capable of extension to higher energy rings as the 20 TeV SSC.

31934 **(LA-tr—85-21) RFQ-funneling.** Schempp, A. (Los Alamos National Lab., NM (USA); Frankfurt Univ. (Germany, F.R.). Inst. fuer Angewandte Physik). 1985. Contract W-7405-ENG-36. Translation of Int. Rep. 85-6, February 1985. 11p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012483.

Funneling is the joining of beams in a zipper arrangement while doubling the frequency in order to increase the beam current, i.e., to utilize the acceptance of the linear accelerator even at the higher frequency. In projects such as the HIF and the SNQ, funneling is necessary in order to obtain higher current, i.e. higher brillance. No experiments have been conducted in this area up to now although it is one of the prerequisites for the realization of this high-current accelerator. Bongardt has presented the only theoretical concept in a long time, while Sarstedt has prepared some foundation for an experiment at our Laboratory. In this report, several divergent ideas on funneling are compiled.

31935 **Ultrahigh gradient particle acceleration by intense laser-driven plasma density waves.** Joshi, C.; Mori, W.B.; Katsouleas, T.; Dawson, J.M. (California Univ., Los Angeles (USA)); Kindel, J.M.; Forslund, D.W. (Los Alamos National Lab., NM (USA)). *Nature (London);* **311:** No. 5986, 525-529(11 Oct 1984).

Space-charge waves driven by resonantly beating two laser beams in a high-density plasma can produce ultrahigh electric fields that propagate with velocities close to c. By phase-locking particles in such a wave, particles may be accelerated to very high energies within a very short distance.

31936 **(BNL—36417) Applications of decelerated ions.** Johnson, B.M. (Brookhaven National Lab., Upton, NY (USA)). Mar 1985. Contract AC02-76CH00016. 7p. (CONF-8410172—10). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011832.

From Symposium of northeastern accelerator personnel; Stony Brook, NY, USA (15 Oct 1984).

Many facilities whose sole purpose had been to accelerate ion beams are now becoming decelerators as well. The development and current status of accel-decel operations is reviewed here. Applications of decelerated ions in atomic physics experiments are discussed.

31937 **(BNL—36450) Separated K^- beams (10 GeV and above).** Bunce, G.M. (Brookhaven National Lab., Upton, NY (USA)). 1985. Contract AC02-76CH00016. 4p. (CONF-8504133—2). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012527.

From International conference on hadron spectroscopy; College Park, MD, USA (20 Apr 1985).

Proton intensities now available at the AGS are considerably higher than just a few years ago and there are steps planned which should increase the accelerated intensities by a factor of four or more by 1988/89. Longer term plans would introduce a stretcher ring to allow for rapid pulsing of the AGS with a continuous spill. The LAMPF II proposal, if approved, would offer still more protons. Separated kaon beams with intensity similar to our present pion beams are, in fact, possible to build now, with the potential of even high kaon flux in the future. It is particularly attractive to work with a kaon minus beam due to the large number of final state combinations which would be available, due to the strange quark. Pion beams, being made of the same quarks as targets, are not so enticing. And yet our spectroscopy has so far been dominated by the pion results; kaon experiments have been more difficult with a factor of 50 to 100 lower intensity, and separated beams have only been possible up to about 6 GeV/c. The exception here is the rf-separated beam at CERN (and earlier rf-separated beams to bubble chambers at CERN and BNL). In the AGS-II Task Force Report, Cason and Donoghue showed that a kaon beam combined with a complete spectrometer capable of observing both neutral and charged particles would increase the available states for spectroscopy for masses from 1 to 3 GeV by a factor of 10. They urged a complete mapping of states, using a sky survey as an analogy. Our present capability is similar to scans of the sky made only in the optical range. They also point out that the specific subject of confinement - whether there can be combinations of quarks and gluons not yet seen - is an exciting topic which is beginning to get theoretical guidance from QCD calculations on a lattice. This confluence of technical advance (intensity) and physics interest (confinement) makes a separated kaon beam particularly compelling. 9 refs.

31938 **(BNL—36454) High vacuum portable pumping station suitable for accelerator use.** Stattel, P.; Briggs, J.; DeBoer, W.; Skelton, R. (Brookhaven National Lab., Upton, NY (USA)). 1985. Contract AC02-76CH00016. 3p. (CONF-850504—35). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011840.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The need for a Portable Pump Station for Ultra High Vacuum use became apparent when the "Isabelle" collider was first being designed. A Portable Pump Station had to be developed which contained the following features: maneuverability, compact size, rugged, self protected against various failures, capable of running unattended, and capable of reaching 10^{-9} torr. The Pump Station that was developed and other variations are the subject of this paper. Emphasis will be on the Isabelle and HITL versions. 1 ref., 2 figs., 1 tab.

31939 **(BNL—36479) Tuning system for capacitively loaded 1/4 accelerating cavity.** McKenzie-Wilson, R.B. (Brookhaven National Lab., Upton, NY (USA)). 1985. Contract AC02-76CH00016. 3p. (CONF-850504—81). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012516.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The Brookhaven National Laboratory NSLS x-ray and vuv rings currently use capacitively loaded $\lambda/4$ rf accelerating cavities. These cavities are manufactured from copper clad plate steel and require a tuning system with a considerable range. Three separate tuning systems are provided, each having its own specific problems and interactions occur between the three systems. A single capacitive tuning system is proposed which will vary the capacitance loading of the cavity directly. The system employs a vacuum balance mechanically driven diaphragm. The control system allows 6 mm of motion at a maximum slewing rate of 1.0 mm per sec and yields a dynamic tuning range of 480 kHz. Design and fabrication details will be presented together with early testing and operating experience.

31940 **(CONF-850504—36) Negative ion sources equipped with continuous annular and spherical geometry surface ionizers.** Alton, G.D.; Mills, G.D. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011939.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

Axial geometry negative ion sources have been designed, developed, and evaluated for use in conjunction with tandem accelerator applications. These sources utilize continuous surface solid tungsten ionizers in either annular or spherical geometries to effect ionization of cesium vapor, which in turn is used to sputter a negatively biased probe containing the material of interest. The annular ionizer geometry source has been incorporated as an "on-line" source for routine operation of the Holifield Heavy Ion Research Facility (HHIRF) tandem accelerator. Both test stand and tandem accelerator operational experience indicate that such sources are reliable, long lived, stably operating and prolific producers of a wide spectrum of negative ions. To date these sources have been used to produce more than 18 negative ion species including Ag^-, Au^-, B^-, CaH_3^-, Cl^-, CrH_2^-, Cu^-, Lu^-, MgH_3^-, Mo^-, Ni^-, O^-, S^-, Si^-, Sn^-, TiH_3^-, Tm^-, and Yb^-. Details of the mechanical design features and computational techniques utilized in arriving at the final electrode configuration are presented in the text. Examples of data pertinent to source operation, the dependence of negative ion yields on certain source operational parameters and of intensities typical of a particular negative ion source are also given. 12 refs., 10 figs.

31941 **(CONF-850504—117) Performance of the H^- ion source for the intense pulsed neutron source.** Stipp, V.; DeWitt, A. (Argonne National Lab., IL (USA)). 1985. Contract W-31-109-ENG-38. 3p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012368.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

In January of 1983, a magnetron type H^- ion source was installed in the Intense Pulse Neutron Source (IPNS) at Argonne National Laboratory. The higher available H^- current has helped enable the weekly average intensity of the Rapid Cycling Synchrotron (RCS) to be increased from 8 μA to over 12 μA. After two years of operation, the reliability of the source producing 40 mA of H^- ions at a 30 Hz repetition rate continues to be excellent.

31942 **(FNAL-TM—1307) Design considerations for personnel access penetrations for the superconducting super collider.** Cossairt, J.D. (Fermi National Accelerator Lab., Batavia, IL (USA)). Apr 1985. Contract AC02-76CH03000. 13p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013027.

The detailed design of the tunnel for the SSC will, hopefully, soon begin. In this note are documented some considerations concerning the design of the radiological shielding for personnel access labyrinths. The methods are standard ones used at Fermilab, most recently described in detail (along with experimental results) in a paper by Cossairt, et al. In the present paper a conceptual design is presented which will provide the required amount of protection for use of the SSC both as a pure collider and as an accelerator used for a fixed-target experimental program. A recipe will be developed which will allow designers to adjust these calculations for small deviations from this conceptual design.

31943 **(GANIL-P—84-10) LISE: a new spectrometer at GANIL for physics on exotic nuclei.** Mueller, A.C. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)). Sep 1984. 7p. (CONF-8409143—11). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751329.

From 7. international conference on atomic masses and fundamental constants (AMCO-7); Darmstadt-Seeheim, F.R. Germany (3 Sep 1984).

The new accelerator facility GANIL at Caen is devoted to heavy-ion physics in the intermediate-energy range 20-100 MeV/A. Due to the construction principle, a compact injector cyclotron followed by two "identical" isochronous sector cyclotrons coupled together by intermediate charge stripping, the accelerated beams are produced in relatively highly charged states. Therefore, little additional stripping is required in order to produce fully "naked" or hydrogen- and helium-like heavy species which are of great actual interest in atomic physics. This gave origin to the project "LISE" (Ligne d'Ions Super-Epluches), a special beam-line, consisting of a stripper and a magnetic analyser in order to produce and to separate the high-charge states and to provide them in form of beams of high optical quality. From the beginning it was also specified that this instrument, with some additional adaptations would serve as well for physics on nuclei far from stability. In the following LISE shall be described and first experimental progress reported.

31944 **(GSI—84-17) Studies on the feasibility of heavy ion beams for inertial confinement fusion.** (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Oct 1984. 134p. (CONF-840142—15). NTIS (US Sales Only), PC A07/MF A01. File Number DE85751124.

From International symposium on heavy ion accelerators and their applications to inertial fusion; Tokyo, Japan (23 Jan 1984).

This reports contains some articles contributed to the named conference. These concern the heavy ion fusion program of the Federal Republic of Germany, heavy ion accelerators, the HIBALL projects, storage rings for heavy ion beams, transport of heavy ion beams, and target projects for fusion applications. 43 references.

31945 **(IFVE-OEA-OKU—83-183) Manual timer.** Lebedev, O.P.; Serebryakov, V.I.; Tishin, V.G. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1983. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701065.

A manual timer operating in the IHEP accelerator synchronizing system is described. The manual timer comprises the reference frequency oscillator, frequency divider, timing counters, switches, coincidence circuits, D-triggers, pulse selection units, operating mode control unit, applifiers- pulse shapers, display and control unit, power supply unit. The device is characterized by low power consumption, compact, flexibility in monitoring and well-developed control means. The errors in time-interval generation and test results are being analyzed.

31946 **(IPNO-GEPL—83-09) CANAL code.** Gara, P.; Martin, E. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). 1983. 74p. (In French). NTIS (US Sales Only), PC A04/MF A01. File Number DE85751325.

The CANAL code presented here optimizes a realistic iron free extraction channel which has to provide a given transversal magnetic field law in the median plane: the current bars may be curved, have finite lengths and cooling ducts and move in a restricted transversal area; terminal connectors may be added, images of the bars in pole pieces may be included. A special option optimizes a real set of circular coils.

31947 **(JINR-R—9-83-920) Conditions for electron beam matched injection in collective accelerator adgezator.** Kazarinov, N.Yu.; Shcheulin, A.S. (Joint Inst. for Nuclear Research, Dubna (USSR). Dept. of New Acceleration Methods). 1983. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701066.

The possibility of one-turn matched injection of the electron beam which has finite emittance and momentum spread into adgezator of the collective accelerator is considered. The ratios between the momentum of distribution function and that of dispersion and β-functions are found. It is shown that with a definite choice of geometry of electromagnetic field trajectory corrector matched injection can be achieved. The adgezator acceptance is found with making allowance of the influence of space charge forces. It is shown that with field index 0.22 and electron energy 2 MeV there is a possibility to form in the adgezator electron rings with electron number 10^{13} and momentum spread 100%-3% at small dimensions of the ring not more than 2 cm.

31948 (KEK—82-14, pp 157-158) **Production of secondary ions by heavy-ion bombardment of rare-gas targets.** Tonuma, T.; Kase, M.; Matsuo, T.; Urakawa, J.; Takahashi, J.; Kumagai, H.; Kambara, T.; Kohno, I. (Institute of Physical and Chemical Research, Wako, Saitama (Japan)). Jan 1983. (In Japanese). NTIS (US Sales Only), PC A11/MF A01. File Number DE85781031. (CONF-8208206—Summ.).

From 7. meeting on linear accelerators; Oho, Ibaraki, Japan (24 Aug 1982).

Published in summary form only.

In Equipment for the nuclear and physical experiment on the isochronous cyclotron U-240 in 1982.

Multi-computer measurement-calculational complexes form the technical base of scientific experiment modern automation systems. One of possible approaches to software creation for the data transmission system in the framework of standard operational systems of all computers, included in the complex, is described. A more poweful M-4030 type computer should employ a data base. Hardcopy logs of interconnection are realized taking into account the hardware. A task from initiative peripheral interrupt a enters the M-4030 computer. The task is performed synchonously by the computers engaged. Exchange of data, input parameters and results proceeds via the data base.

31977 (**LA-UR—85-1584**) **Ion source development for the Los Alamos heavy ion fusion injector.** Rutkowski, H.L.; Oona, H.; Meyer, E.A.; Shurter, R.P.; Engelhardt, L.S.; Humphries, S. Jr. (Los Alamos National Lab., NM (USA); New Mexico Univ., Albuquerque (USA). Inst. for Accelerator and Plasma Beam Technology). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—152). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012682.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

A multi-beam injector is being designed and built at Los Alamos for the US Heavy Ion Fusion Program. As part of this program, development of an aluminum-spark, pulsed plasma source is being carried out. Faraday cup diagnostics are used to study current emission and to map the current profile. An aluminum oxide scintillator with photographic film is used in conjunction with a pepper-pot to obtain time integrated emittance values.

31978 **(LA-UR—85-1605) High-power, solid-state rf source for accelerator cavities.** Vaughan, D.R.; Mols, G.E.; Reid, D.W.; Potter, J.M. (Westinghouse Electric Corp., Baltimore, MD (USA). Defense and Electronics Center; Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—63). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012672.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

During the past few years the Defense and Electronics Center of Westinghouse Electric Corporation has developed a solid-state, 250-kW peak, rf amplifier for use with the SPS-40 radar system. This system has a pulse length of 60 μs and operates across the frequency band from 400 to 450 MHz. Because of the potential use of such a system as an rf source for accelerator applications, a collaborative experiment was initiated between Los Alamos National Laboratory and Westinghouse to simulate the resonant load conditions of an accelerator cavity. This paper describes the positive results of that experiment as well as the solid-state amplifier architecture. It also explores the future of high-power, solid-state amplifiers as rf sources for accelerator structures.

31979 **(LA-UR—85-1611) Los Alamos free-electron laser.** Watson, J.M. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 6p. (CONF-850504—49). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012666.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

During the past year the Los Alamos free-electron laser (FEL) oscillator has demonstrated high peak and average power (10 MW and 6 kW), broad-wavelength tunability (9 to 35 μm), and near-ideal optical quality (0.9 Strehl ratio). An electron energy-extraction efficiency of 1% was measured. The predicted production of synchrotron sidebands also was observed in the broadened optical spectrum. As shorter wavelengths and higher powers are pursued, higher currents with improved beam quality will be required. Advanced injectors and energy-recovery systems are being developed to meet these demands. 17 refs., 6 figs., 3 tabs.

31980 **(LA-UR—85-1614) Los Alamos Proton Storage Ring fast-extraction kicker system.** Power, J.F.; Blind, B.; Jason, A.J. (Los Alamos National Lab., NM (USA)). May 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—52). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012663.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

We describe the kicker system used by the Los Alamos Proton Storage Ring (PSR) for fast extraction of accumulated 800-MeV proton beam. The system has several severe constraints in terms of rise time, field quality, and magnet dimensions. These are, in turn, defined by characteristics of the stored beam, ring lattice, and the allowable activation of ring components. Design methods to meet the constraints are outlined here and we describe the novel modulators that produce the fast pulses required. 3 refs., 7 figs.

31981 **(LA-UR—85-1620) Ferrite kicker magnet for the LAMPF switchyard upgrade.** Hardekopf, R.A.; Higgins, E.F.; Lunsford, J.S. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—60). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012657.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The new LAMPF switchyard requires a kicker magnet as the first element in the transport line leading to the Proton Storage Ring (PSR). The magnet must produce 1-ms-long pulses with 40-μs rise time and <0.3% flat-top regulation to deflect the 800-MeV H^- beam by 1.2°. We have constructed two 1-m-long, single-turn ferrite magnets, each powered by a modulator supplying up to 2400 A at a maximum rate of 24 Hz. The modulators use a transistor amplifier/regulator, a dual pulse-forming-network (PFN), and a compensating circuit driven by a function generator to achieve a total 0.1% current variation in the pulse. The system also produces an alternate kicking mode consisting of 150-μs-long pulses at a maximum rate of 120 Hz; the two modes can be multiplexed within the charging power-supply limitations. 3 refs., 6 figs.

31982 **(LA-UR—85-1624) Optimizing data access in the LAMPF control system.** Schaller, S.C.; Corley, J.K.; Rose, P.A. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—55). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012653.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The LAMPF control system data access software offers considerable power and flexibility to application programs through symbolic device naming and an emphasis on hardware independence. This paper discusses optimizations aimed at improving the performance of the data access software while retaining these capabilities. The only aspects of the optimizations visible to the application programs are "vector devices" and "aggregate devices." A vector device accesses a set of hardware related data items through a single device name. Aggregate devices allow run-time optimization of references to groups of unrelated devices. Optimizations not visible on the application level include careful handling of: network message traffic; the sharing of global resources; and storage allocation.

31983 **(LA-UR—85-1640) Proposed bunching scheme for a polarized H^- injector.** Swain, G.R.; Browman, A.A. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—48). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012648.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

Improvements to the polarized H^- injector at LAMPF will include a two-stage buncher and beam chopper. The buncher scheme will permit the compression of a major part of the current in 20 rf cycles of the drift-tube linac (100 nsec) into a single rf cycle (5 nsec), thus making possible time-of-flight experiments with the polarized H^- beam. A proposed first buncher stage would use a ramp drive waveform; the second stage, a sinusoidal waveform. Design and sensitivity calculations are summarized, including beam energy considerations, buncher and chopper drive requirements, and longitudinal and transverse beam dynamics. The calculations indicate that about 70% of the beam from the source may be bunched in the 1-nsec acceptance region of the linac, with less than 0.1% of the beam in neighboring rf cycles. 5 figs.

31984 **(LA-UR—85-1735) Recent advances in remote handling at LAMPF.** Lambert, J.E.; Grisham, D.L. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—107). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012725.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The Clinton P. Anderson Meson Physics Facility (LAMPF) has operated at beam currents above 200 microamperes since 1976. As a result, the main experimental beam line (Line A) has become increasingly radioactive over the years. Since 1976 the radiation levels have steadily increased from 100 mR/hr to levels that exceed 10,000 R/hr in the components near the pion production targets. During this time the LAMPF remote handling system, Monitor, has continued to operate successfully in the ever-increasing radiation levels, as well as with more complex remote-handling situations. This paper briefly describes the evolution of Monitor and specifically describes the complete rebuild of the A-6 target area, which is designated as the beam stop, but also includes isotope production capabilities and a primitive neutron irradiation facility. The new facility includes not only the beam stop and isotope production, but also facilities for proton irradiation and a ten-fold expansion in neutron irradiation facilities.

31985 (LA-UR—85-1736) **Major facility overhauls at LAMPF.** Grisham, D.L.; Lambert, J.E.; Sommer, W.F. Jr. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—112). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012724.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The Clinton P. Anderson Meson Physics Facility (LAMPF) is a linear proton accelerator designed to operate at 800 MeV and 1.0 mA. It has been operating at power levels above 200 microamperes since February of 1976 and now routinely operates near the design level. This paper outlines the problems encountered with the original target cell components, the repairs required since 1976, and specifically details the steps involved in the complete replacement of the vital target cell components. These components include target boxes, collimators, main beam line magnets, and the front-end magnets of the secondary beam lines. The A-2 target cell was replaced in the spring of 1983 and the A-1 target cell was replaced in the spring of 1984. Both have operated satisfactorily since their completion, with only minor difficulties. The overhaul and total component replacement in the beam stop area (A-6) was completed in early May 1985 and has just been placed in operation. The upgrade, in addition to the replacement of the beam stop and the vacuum-to-air window with state-of-the-art designs, provides a greatly increased capability of both proton and neutron irradiation of materials.

31986 (LA-UR—85-1737) **Beam line windows at LAMPF.** Brown, R.D.; Grisham, D.L.; Lambert, J.E. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—113). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012723.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The A-6 main beam-line window at LAMPF separates the vacuum of the main beam line from the isotope production station, proton irradiation ports, and the beam stop, which operate in air. This window must withstand the design beam current of 1 mA at 800 MeV for periods of at least 3000 hours without failure. The window is water cooled and must be strong enough to withstand the 2.1 MPa (300 psig) cooling water pressure, as well as beam-induced thermal stresses. Two designs have been used to meet these goals, a stepped-plate window and a hemispherical window, both made from a precipitation-hardened nickel base alloy, Alloy 718. Calculations of the temperatures and stresses in each of these windows are presented.

31987 (NAC-AR—84-01) **Annual report June 1984. [Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Centre].** (Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Centre). 1984. 308p. NTIS (US Sales Only), PC A14/MF A01. File Number DE85780939.

31988 (SAND—84-2392C) **Automated magnet testing facility.** Lancaster, K.T.; Sharpe, A.W. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 11p. (CONF-850616—12). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012863.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

The automated Magnet Testing Facility (MTF) is a computer controlled, 60 kJ, parallel capacitor bank that was constructed to pulse test solenoidal magnets. Coil sets from different vendors were evaluated on two criteria: uniformity of field and coil reliability. The first criterion, uniformity of field, is evaluated by installing a pair of coils into stainless steel housings and pulse mapping the fields at a low energy level. Forty field-strength samples were easily collected with the one button operation of the MTF. Two thousand high field pulse tests, at a 20 kG level, is the second criterion for magnet acceptance. In a manually operated system a single operator can achieve this goal in six months. In a continuous operating mode, MTF can achieve the same goal in 42 days.

31989 (SAND—85-0039C) **New directional couplers for multimode circular waveguides applied to intense pulsed microwave systems.** Earley, L.M.; Ballard, W.P.; Wharton, C.B. (Sandia National Labs., Albuquerque, NM (USA); Cornell Univ., Ithaca, NY (USA). Lab. of Plasma Studies). 1985. Contract AC04-76DP00789. 4p. (CONF-850504—27). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011753.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

Three new types of directional couplers are described for use in overmoded circular waveguide operating in the TM_{01} mode. The types are (1) circular/rectangular waveguide multihole couplers, (2) circular waveguide/coaxial multihole couplers, and (3) circular waveguide loop couplers. These directional couplers are designed to diagnose intense pulsed microwave systems in the frequency range 3 to 18 GHz. Coupling coefficients vary between 50 dB and 70 dB with directivities between 13 dB and 20 dB. These devices have been used to measure the output powers of relativistic magnetrons and backward wave oscillators (BWOs) in the power range 100 MW to 300 MW.

31990 (SLAC-PUB—3610) **Solid state high power amplifier for driving the SLC injector klystron.** Judkins, J.G.; Clendenin, J.E.; Schwarz, H.D. (Stanford Linear Accelerator Center, CA (USA)). Mar 1985. Contract AC03-76SF00515. 3p. (CONF-850504—127). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013063.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The SLC injector klystron rf drive is now provided by a recently developed solid-state amplifier. The high gain of the amplifier permits the use of a fast low-power electronic phase shifter. Thus the SLC computer control system can be used to shift the phase of the high-power rf rapidly during the fill time of the injector accelerator section. These rapid phase shifts are used to introduce a phase-energy relationship in the accelerated electron pulse in conjunction with the operation of the injector bunch compressor. The amplifier, the method of controlling the rf phase, and the operational characteristics of the system are described. 5 refs., 4 figs.

31991 (SLAC-PUB—3616) **Electron wind in strong wave guide fields.** Krienen, F. (Stanford Linear Accelerator Center, CA (USA)). Mar 1985. Contract AC03-76SF00515. 4p. (CONF-850504—110). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013062.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The x-ray activity observed near highly powered wave guide structures is usually caused by local electric discharges originating from discontinuities such as couplers, tuners or bends. In traveling waves electrons are shown to move in the direction of the power flow. Seed electrons can multipactor in a traveling wave, the moving charge pattern is different from the multipactor in a resonant structure and is self-extinguishing. Given sufficient primary sources, the charge density in the wave guide will modify impedance and propagation constant of the wave guide. An estimate is made of the radiation level inside the output wave guide of the SLAC, 50 MW, S-band, klystron. Possible contributions of radiation to window failure are discussed.

31992 (SLAC-PUB—3632) **GIANT: a computer code for General Interactive ANalysis of Trajectories.** Jaeger, J.; Lee, M.; Servranckx, R.; Shoaee, H. (Stanford Linear Accelerator Center, CA (USA)). Apr 1985. Contract AC03-76SF00515. 3p. (CONF-850504—106). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013058.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

Many model-driven diagnostic and correction procedures have been developed at SLAC for the on-line computer controlled operation of SPEAR, PEP, the LINAC, and the Electron Damping Ring. In order to facilitate future applications and enhancements, these procedures are being collected into a single program, GIANT. The program allows interactive diagnosis as well as performance optimization of any beam transport line or circular machine. The test systems for GIANT are those of the SLC project. The organization of this program and some of the recent applications of the procedures will be described in this paper.

31993 (SLAC-PUB—3633) **Error message recording and reporting in the SLC control system.** Spencer, N.; Bogart, J.; Phinney, N.; Thompson, K. (Stanford Linear Accelerator Center, CA (USA)). Apr 1985. Contract AC03-76SF00515. 3p. (CONF-850504—84). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013057.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

Error or information messages that are signaled by control software either in the VAX host computer or the local microprocessor clusters are handled by a dedicated VAX process (PARANOIA). Messages are recorded on disk for further analysis and displayed at the appropriate console. Another VAX process (ERRLOG) can be used to sort, list and histogram various categories of messages. The functions performed by these processes and the algorithms used are discussed.

31994 (SLAC-PUB—3671) **High-resolution phosphor screen beam profile monitor.** Yencho, S.; Walz, D.R. (Stanford Linear Accelerator Center, CA (USA)). May 1985. Contract AC03-76SF00515. 4p. (CONF-850504—83). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013074.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

A high-resolution luminescent screen beam profile monitor was developed to allow viewing of both conventional large diameter SLAC e^+/e^- beams, and also collider rf-bunches having small transverse spatial extent, with one instrument. The principal features of the monitor are described. They include the two-power magnification system offering magnifications of 12 and 78X, respectively; the reticle grid which is optically superimposed on the screen image by a cube beam splitter; selection of a suitable camera; and the $Al_2O_3(Cr)$ phosphor screen. A simplified version of the monitor for viewing of only micron-sized beams for applications in the collider arcs and final focus regions and achieving a magnification of $\sim$ 40X, coupled with a resolution of $\sim 20\mu m$ is also presented. 4 refs., 4 figs.

31995 (SLAC-PUB—3689) **Increased intensity performance of the Brookhaven AGS.** Raka, E.; Ahrens, L.; Frey, W.; Gill, E.; Glenn, J.W.; Sanders, R.; Weng, W. (Stanford Linear Accelerator Center, CA (USA); Brookhaven National Lab., Upton, NY (USA)). May 1985. Contract AC03-76SF00515. 4p. (CONF-850504—71). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013371.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

With the advent of H^- injection into the Brookhaven AGS, circulating beams of up to 3×10^{13} protons at 200 MeV have been obtained. Rf capture of 2.2×10^{13} and acceleration of 1.73×10^{13} up to the transition energy ($\approx$ 8 GeV) and 1.64×10^{13} to full energy ($\approx$ 29 GeV) has been achieved. This represents a 50% increase over the best performance obtained with H^+ injection. The increase in circulation beam current is obtained without filling the horizontal aperture. This allows the rf capture process to utilize a larger longitudinal phase space area ($\approx$ 1 eV sec/bunch vs $\leqq$ 0.6 eV sec with H^+ operation). The resulting reduction in relative longitudinal density partially offsets the increase in space charge effects at higher currents. In order to make the capture process independent of injected beam current, a dynamic beam loading compensation loop was installed on the AGS rf system. This is the only addition to the synchrotron itself that was required to reach the new intensity records. A discussion of injection, the rf capture process, and space charge effects is presented. 9 refs., 5 figs.

31996 (SLAC-TN—84-1-Rev.) **Time domain reflectometry for SLC BPM system. Revision.** Thompson, D.R. (Stanford Linear Accelerator Center, CA (USA)). Mar 1985. Contract AC03-76SF00515. 36p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012389.

This document is intended for use as a maintenance manual for troubleshooting installed SLC Beam Position Monitor stripline assemblies and the associated cabling, using Time Domain Reflectometry. Once a technician becomes familiar with this manual's procedures, the Table of Contents can serve as a checklist.

31997 (UM-HE—84-1, pp 73-77) **Injection, extraction and beam abort system for the SSC.** Leemann, B.T. (Univ. of California, Berkeley). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.). Contract AC03-76SF00098.

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

The subject of beam extraction and abortion from a 20 TeV accelerator has been explored by one working group at the 2nd ICFA workshop in 1979. This study concluded that the design of a fast extraction channel is relatively straightforward, and involves conventional extraction channel elements. Similarly, in a contribution to the present proceedings, Willie comes to the same conclusion with regard to a 1 TeV injection channel for the SSC. In this paper we demonstrate the feasibility of implementing injection and extraction channnels into the 6.5 Tesla sample lattice designed by Garren using hardware parameters as suggested. Finally, an attempt is made to estimate the required beam size at the beam dump and its consequences for the transfer line optics are considered. 6 refs., 6 figs., 2 tabs.

31998 (UM-HE—84-1, pp 93-94) **Some remarks on the injection into the SSC.** Wille, K. (Stanford Univ., CA). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.). Contract AC03-76SF00515.

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

For this study a high energy booster (HEB) with a 5T magnet type is chosen as figured out during the Cornell Workshop. This preaccelerator provides the main ring with 18 μs long chains of bunches containing a total number of 1.2×10^{13} particles each. A sequence of 18 such chains fits within the main ring if its circumference is supposed to be 100 km. With these values a total number of 2×10^{14} particles per beam should be possible. There are unavoidable gaps between the stored bunch chains because of the non zero lengths of the rising and falling edges of the kicker pulse. The length of these gaps is mainly determined by kicker tolerances which will be discussed next. Other arguments may come from the detector requirements. The injection energy is set to E/sub inj/ = 1 TeV according to the results of the Cornell Workshop. 1 ref., 2 figs., 1 tab.

31999 (UM-HE—84-1, pp 189-190) **Synchrotron-radiation in a superconducting super collider: optical considerations.** Rehn, V. (Naval Weapons Center, China Lake, CA). 1984. NTIS, PC A09/MF A01. File Number DE85004602. (CONF-831264—Summ.).

From Workshop on accelerator physics issues for a superconducting super collider; Ann Arbor, MI, USA (12 Dec 1983).

With the prospect of a significant synchroton-radiation (SR) power emission by the SSC (10 to 100 kW), it is evident that methods are needed to minimize the SR heat load on the cryogenic system. The estimated cost of 4.5K cooling capacity is about $500K/kW, and the estimated power required in operation is about 1 MW/kW. If the SR load can be absorbed at a much higher temperature, both these costs will be greatly reduced. Several schemes have been suggested for accomplishing this, all of which depend on an appropriate optical design to ensure that the SR is absorbed mainly at the designated higher-temperature absorbers. The purpose of this short paper is to indicate the optical considerations of importance in such an SR optical system. 9 refs., 2 figs.

32000 **Fermilab accumulator magnets vacuum chamber heating system.** Satti, J.A.; Lee, G.N. (Fermi National Accelerator Laboratory, Batavia, Illinois 60510). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* 3: No. 3, 1695-1698(May 1985).

The Fermi National Accelerator Laboratory (Fermilab) is building an accumulator ring to store antiprotons for high energy physics proton—antiproton collisions in the Tevatron accelerator. The accumulator ring, approximately 474 m in circumference, consists of many quadrupole and dipole magnets connected with stainless steel vacuum chambers for beam circulation. The vacuum pressure required is in the low 10^{-10} Torr range. To reach this pressure, the vacuum chambers are baked at 300 °C each time they have been opened to atmospheric pressure. The critical problem is to bake the chambers in the magnets at high temperature without overheating the laminated magnets. Some of the magnets are 5 m long with very restrictive space for the heaters and insulation. An average space of only 7.5 mm around the chambers is available. In this space a heating system has been designed and tested to heat the chamber to 300 °C and allow a maximum temperature of 65 °C next to the magnet components. This was accomplished by using a heating blanket completely covered with a water cooled copper heat sink jacket to protect the magnet from the high temperatures. The design of a final selected heating blanket is discussed. A prototype test results are given with comparison of calculated and measured temperature distribution.

32001 **Monitoring and calibration system for neutrino flux measurement in a high energy dichromatic beam.** Blair, R. (California Inst. of Tech., Pasadena (USA); Columbia Univ., New York (USA)); Jin, B. (California Inst. of Tech., Pasadena (USA); Academia Sinica, Beijing (China). Inst. of High Energy Physics); Macfarlane, D. (California Inst. of Tech., Pasadena (USA); Toronto Univ., Ontario (Canada)); Messner, R.L. (California Inst. of Tech., Pasadena (USA); Stanford Linear Accelerator Center, CA (USA)); Novikoff, D.B. (California Inst. of Tech., Pasadena (USA); Hughes Aircraft Co., El Segundo, CA (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment;* **226**: No. 2/3, 281-300(Oct 1984).

In an experiment to measure the cross section for ν-N interactions, the neutrino flux is inferred from measured properties of the secondary hadron beam. The measurements of intensity, composition, and phase space are inputs to a Monte Carlo program which simulates the neutrino beam impinging on the experimental target detector. The components, technical design, and calibration of the devices which monitor the secondary beam are discussed. The accuracy with which the neutrino flux can be determined, given the limitations of the secondary beam monitoring, is also indicated.

32002 **Low-noise 2-4 GHz preamplifier.** Jackson, H.G.; Shimizu, T.T. (Lawrence Berkeley Lab., CA (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment;* **226**: No. 2/3, 560-563(Oct 1984).

A low-noise preamplifier has been developed for use in stochastic beam cooling experiments. The preamplifier consists of a cascade of four GaAs field-effect transistors, and is made with lumped components.

32003 **Magnet-field design considerations for a high-energy superconducting cyclotron.** Botman, J.I.M.; Craddock, M.K.; Kost, C.J.; Richardson, J.R. (TRIUMPH, Vancouver, British Columbia). *International Conference on High Energy;* 1-3(Aug 1983). (CONF-830822—).

From 12. international conference on high energy accelerators; Batavia, IL, USA (11 Aug 1983).

This paper reports the pole shape designs for a two stage superconducting isochronous cyclotron combination (CANUCK) to accelerate 100 μA proton beams to 15 GeV. The pole shape of the 15 sectors of the first stage 3.5 GeV proton cyclotron provides isochronism over the full energy range and a constant axial tune over all but the lowest energies. Progress on the pole design of the 42-sector 15-GeV second stage is also reported. The magnetic fields are computed from the current distribution of the superconducting coils and the infinitely thin current sheets simulating the fully saturated poles. A least-squares method is used to minimize deviations from isochronism by adjusting the size of various elemental shim coils placed around the main coil. The method to obtain the desired axial tune is described. 13 references, 6 figures.

4304 Storage Rings

32004 **(BNL—36430) Saturation of a longitudinal instability due to nonlinearity of the wake field.** Krinsky, S. (Brookhaven National Lab., Upton, NY (USA)). 1985. Contract AC02-76CH00016. 3p. (CONF-850504—82). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012514.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

Self-sustained synchrotron oscillations are observed in electron storage rings. In general the theoretical description of the saturation of an instability for large oscillation amplitude is a difficult problem, and techniques have not yet been developed which yield analytic approximations to the appropriate nonlinear Vlasov or Fokker-Planck equations. In this paper, a single point bunch interacting with the wake field from a single resonant mode of an rf cavity is considered, and the averaging method of Bogoliubov and Mitropolsky is used to study the saturation of the initial exponential growth of the oscillation amplitude, due to the nonlinearity of the wake field. The determination of the limiting amplitude of oscillation is discussed both in the presence and in the absence of radiation damping.

32005 **(CONF-850504—43) Vacuum system for the Argonne 6 GeV synchrotron light source.** Wehrle, R.; Moenich, J. (Argonne National Lab., IL (USA)). 1985. Contract W-31-109-ENG-38. 3p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012286.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The ANL vacuum system for the 6 GeV light source storage ring features non-evaporable strip getter pumps for uniform pumping around the ring within a gas desorption antechamber, and it also features lumped getter pumping directly under and above crotch radiation absorbers that are positioned after each bending magnet. Based on experiments at ANL in 1980 and by others, the technical and economical advantages have been established for the use of the distributed NeG pumps of non-magnetic strips coated with a non-evaporable Zr Al getter matrix. The NeG strip pump lifetime approaches ten years. The antechamber improves the isolation of the gas desorption process from the main beam chamber and beam. The combination of these vacuum techniques; the NeG strip getter pumps, the gas desorption antechambers, and the lumped ion and lumped getter pumping provide a unique and reliable system for maintaining long beam lifetime.

32006 **(LA-UR—85-1613) Los Alamos high-current proton storage ring: a status report.** Lawrence, G.P.; Hardekopf, R.A.; Jason, A.J.; Clout, P.N.; Sawyer, G.A. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 5p. (CONF-850504—51). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012664.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The Proton Storage Ring (PSR), whose installation was recently completed at Los Alamos, is a fast-cycling high-current accumulator designed to produce intense 800 MeV proton pulses for driving a spallation neutron source. The ring converts long beam pulses from the LAMPF linear accelerator into short bunches well matched to requirements of a high-resolution neutron-scattering materials science program. The initial performance goal for this program is to provide 100-μA average current at the neutron production target within a 12-Hz pulse rate. Project construction began in May 1982, and was completed in mid-April 1985. First beam was circulated in the ring on April 26. Operation at 20 μA is scheduled for September 1985, with full intensity within the next year. The storage ring was originally designed to function in a second mode in which six 1-ns bunches are accumulated and separately extracted every LAMPF macropulse. Implementation of this mode, which would serve a fast-neutron nuclear-physics program, has been deferred in favor of initial concentration on the neutron-scattering program. This paper summarizes the PSR design and status. Unique machine features include high peak current, two-step charge-stripping injection, a low-impedance buncher amplifier to counter beam-loading, and a high-repetition-rate strip-line extraction kicker. 19 refs., 31 figs., 3 tabs.

32007 **Glow discharge cleaning of stainless steel accelerator beam tubes.** Hseuh, H.C.; Chou, T.S.; Christianson, C.A. (Accelerator Department, Brookhaven National Laboratory, Upton, New York 11973). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* 3: No. 3, 518-522(May 1985).

Glow discharge cleaning has been employed successfully in the CERN ISR to eliminate beam induced pressure bumps and had been adopted as a final surface treatment for the beam vacuum system of CBA. A glow discharge cleaning facility for beam tubes up to 5.5 m in length has been constructed and is in operation. To ensure efficient and thorough cleaning of the long tubes, a residual gas analyzer was used to monitor the exhaust during cleaning. Quantitative studies of the glow discharge process were performed on several tubes by using Ar or Ar/O_2 mixture (0.1 to 10 Pa) and by varying the discharge density ($<$ or $=30\ \mu A/cm^2$). The results of the studies, such as the desorption yields of H_2O, CO, and CO_2 with respect to the accumulated dosage, the depletion of O_2 in Ar/O_2 mixture, will be reported here. The effect of venting to air and CO_2, as well as plasma deposition of carbon will also be discussed.

32008 **Electron storage ring beam lifetime dependence on pressure and pumping speed.** Halama, H.J. (Brookhaven National Laboratory, Upton, New York 11973). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* 3: No. 3, 1699-1702(May 1985).

The beam loss in electron storage rings depends to a large extent on the interaction of the beam with heavier residual gas molecules such as CO, CO_2, and A due to bremsstrahlung and Coulomb scattering. The gas density inside the vacuum chamber is determined by the surface condition of the vacuum chamber, which is bombarded by photons (synchrotron radiation) generated by circulating electron beams, and by the installed pumping. During the initial commissioning severe limitations on the achievable beam current were observed due to large pressure rises. The x-ray ring was shut down for several months and its vacuum system was updated and baked out. Residual gas spectra obtained after the shut down were typical of a well baked out system, i.e., hydrogen constituted ~95% of the gas and the average pressure was in the 10^{-10} Torr range. During initial operation the composition of desorbed gases was 43% H_2, 25% CO, and 16% CO_2 and CH_4. After 3 months of beam conditioning the desorption rate dropped by a factor of 5 and the CO, CO_2, and CH_4 peaks represented smaller percentage of total desorbed gas. Beam lifetime did not, however, show a corresponding increase.

32009 **(AD-A—150316/8/XAB) Shuttle flight test of an advanced gamma-ray detection system. Semi-annual technical report, 1 July-31 December 1983.** Rester, A.C. (Florida Univ., Gainesville (USA). Space Astronomy Lab.). 28 Feb 1984. 21p. NTIS, PC A02/MF A01.

In August of 1983 the Gamma-Ray Advanced Detector (GRAD) Project was assigned to the AFP-675 Program for flight on a future space-shuttle mission. In order to adapt the experiment to the requirements of AFP-675, a number of changes were made both in hardware and software. However, the necessity for such changes is more than affected by an expansion in scope of the experiment made possible by the introduction of a Payload Specialist into the operation. The principal changes to be made are in the avionics, as GRAD was originally designed for operation through ground-based telemetry. This complete redesigning of our avionics to accomodate operation by a Payload Specialist from the aft flight deck of the Orbiter allows us to take advantage of very recent findings on radiation-induced microprocessor failure in other space shuttle experiments in order to make the GRAD avionics less vulnerable to such latch-ups. Advances in bismuth germanate (BGO) scintillator technology during the year since construction of the prototype GRAD now make it possible to construct a BGO shield with a closed-ended geometry. This improvement will enhance the signal-to-noise ratio. In addition, a new type of decay-vetoed calibration probe using an alpha-rather than a beta-emitting radioactive source is being investigated.

32010 **(AECL—7684) Progress report: Health Sciences Division, 1982 January 1 to March 31.** (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Jul 1982. 109p. (PR-HS—11). NTIS (US Sales Only), PC A06/MF A01. File Number DE85701526.

Investigations of etching methods of CR-39 plastic used to detect fission fragment damage tracks has led to a preliminary chemical etching before the electrochemical etch. Leakage spectrum calculations of a D_2O-moderated ^{252}Cf source suitable for neutron dosimeter calibration have been completed. The Gaussian plume model for short range atmospheric dispersion of radionuclides is being modified to account for roughness of local terrain. A capillary effect in soils, just above a watertable has been shown to be a possible mechanism whereby large hydraulic head changes and later large groundwater fluxes can be induced by relatively small additions of water. Studies of radiation damage to human DNA continue, and include also DNA damage caused by other chemical and physical factors, such as hyperthermia treatment; and the ability of human white blood cells to damage mouse cell DNA. A paper describing dose conversion factors used in the Canadian waste disposal assessment was prepared. Equipment measuring parameters of metal ion-amino acid reactions is now working, and computer programs to analyze results are being installed. A literature review report on this topic is in the final preparation stages. A computer record-keeping system for individual monitoring results is being developed.

32011 **(AECL—7777) Progress report: Health Sciences Division, 1982 April 1-June 30.** (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Aug 1982. 95p. (PR-HS—12). NTIS (US Sales Only), PC A05/MF A01. File Number DE85701527.

Chemical and electrochemical etching parameters for CR-39 plastic are being studied as a function of neutron energy from 0.2 to 14.7 MeV. An improved oven for UV annealing of sensitized TLDs has been built and optimum operating characteristics are being determined. Circuits and components for the reactor stack effluent monitor are being designed. New sensors and data loggers have been installed to measure water and air temperatures, and air velocity profiles, at Perch and Maskinonge Lakes. Measurements of ^{222}Rn and tritium have been investigated in groundwater discharge from borehole CR22, near Chalk Lake. Measurements of sorption/desorption of ^{60}Co with sediments from East Swamp have been continued. Elution rates of Pu and Am from columns and associations with particulates have been shown to depend strongly on the redox conditions. In rock fracture filling materials studies the ratios of uranium isotopes ($^{234}U/^{238}U$) and of thorium to uranium ($^{230}Th/^{238}U$) together with uranium contents are providing some values, but interpretation remains difficult. Growth rate of bivalve mollusc cultures has been shown to be affected by nutrients to different extents at the control (10 degC) and elevated (20 degC) temperatures. DNA studies of radiation effects continue. A thoron (^{220}Rn)-in-breath monitor has been designed and will be constructed at CRNL. The dose to basal cells of bronchial epithelium from inhalation of long-lived alpha-emitting aerosols has been calculated, and the risk of bronchial cancer from this dose estimated.

32012 **(AECL—8105) Progress report: Health Sciences Division, 1983 January 1-June 30.** (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Sep 1983. 131p. (PR-HS—15). NTIS (US Sales Only), PC A07/MF A01. File Number DE85701530.

Electrochemically-etched CR-39 plastic can register protons up to 7 MeV by adjusting pre-etch times. Improving TLD reader sensitivity by using a UV-transmitting light guide has been investigated for both LiF and MgB_4O_7:Dy dosimeters. A portable tritium-in-air monitor has been modified to provide compensation against response to noble gases in sampled air. Development of the stack effluent monitor continued with an examination of the relative advantages of sliding shuttles for a sample changer. Relationships between dosimeter reading and critical organ doses and effective dose equivalent have been established by tests with a phantom loaded with dosimeters and exposed in two locations. The relationship of the energy budget of Perch Lake to large scale weather patterns of the area is being investigated in a study with the University of Waterloo. The response of drainage systems to melting, infiltration and/or runoff of winter snowpack is being studied. The integrated mass of ^{137}Cs in eight lake sediments near CRNL has been found to be much less than total atmospheric fallout between 1955 and 1982. Studies have continued on freshwater molluscs in removing particulates from suspension and sedimenting the material as faecal waste. Distribution measurements of residual bomb tritium in drainage waters from the Gloucester special disposal site have been done to establish a time scale for groundwater movement. Slightly elevated levels of organically-bound ^{3}H and ^{14}C were measured in grasses near B and C Waste Management burial trenches. A customer manual describing CRNL's capability to do accurate gas or liquid system pipeline flow measurements using short half-life radiotracers is being prepared. Research continues on non-lethal radiation doses to DNA in a variety of organisms. Experimental protocol for experiments involving radioisotope administration to volunteers have been reviewed and approved.

32013 (AERE-M—3399) Construction and calibration of a simple scintillation counter for monitoring radioactive gases in ducts. Johnston, M.S. (UKAEA Atomic Energy Research Establishment, Harwell. Environmental and Medical Sciences Div.). Jul 1984. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701250.

A report is given of the practical construction, laboratory calibration and simple-in-situ calibration check of scintillation detectors used for monitoring radioactive inert gases in gaseous effluents. The $\beta\gamma$-ray and γ-ray detectors are identical except for an absorber which is placed over the window of the γ-ray detector after calibration. The construction and calibration of both detectors is therefore identical.

32014 (AERE-M—3433) Filter paper counting system incorporating a segmented alpha particle detector. Hutchinson, I.G.; Green, B.D. (UKAEA Atomic Energy Research Establishment, Harwell. Instrumentation and Applied Physics Div.). Nov 1984. 14p. HMSO, London, price Pound 4.00.

Measurements of the level of alpha-active airborne particulates are performed routinely throughout the Authority. Using appropriate sampling devices, air is drawn through filter papers in order to extract airborne particulates. The activity on these filter papers may then be counted either in situ using appropriate instruments, e.g. the alpha-in-air monitor type 3280, or alternatively off line using an alpha drawer unit such as the 0744 fitted with a solid state alpha detector. A sample with an abnormally high count may then be examined further by autoradiography to determine whether the activity is distributed homogeneously across the filter or is present as discrete particulates. In an attempt to simplify the examination, a demonstration segmented alpha detector system has been developed which will provide information about the spatial distribution of activity across the surface of filter papers. A software package to simplify data acquisition and presentation has been written for a system based on a Commodore PET and Harwell 6000 series electronics.

32015 (AERE-R—11397) Measurement of neutron spectra with hydrogen proportional counters. Part 1. Spectrometry system and calibration. Birch, R.; Peaple, L.H.J.; Delefield, H.J. (UKAEA Atomic Energy Research Establishment, Harwell. Environmental and Medical Sciences Div.). Oct 1984. 31p. HMSO, London, price Pound 5.00.

A transportable neutron spectrometry system, based on four spherical hydrogen proportional counters, has been developed to measure standard reference radiation fields, for research and development on new dosimeters, and to determine spectra in environments of moderate dose-equivalent rates. The system has been calibrated and tested using monoenergetic neutron beams of known energies, and the response functions for the four counters determined. Measurements of the spectrum of an Am-Li(α,n) source are reported. This neutron source, which produces neutrons with a mean energy of about 0.5 MeV, is of particular interest as it has potential as a standard reference source for the calibration of radiological protection instruments and dosimeters. The system has also been successfully used for measurements around a nuclear reactor although, because of its low sensitivity, the measurement times are rather long and a more sensitive system based on larger cylindrical counters is being developed specifically for this type of application.

32016 (CERN-EP—83-136) Electromagnetic calorimetry using scintillating plastic fibres. Burmeister, H.; Sonderegger, P.; Gago, J.M.; Maio, A.; Pimenta, M.; Perrin, D.; Thevenin, J.C. (European Organization for Nuclear Research, Geneva (Switzerland); Instituto Nacional de Investigacao Cientifica, Lisbon (Portugal); Neuchatel Univ. (Switzerland); CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). 9 Sep 1983. 12p. (CONF-8306110—7). NTIS (US Sales Only), PC A02/MF A01. File Number DE85901031.

From 2. Pisa meeting on advanced detectors; Castiglione della Pescaia, Italy (2 Jun 1983).

When used in lead-scintillator sandwich calorimetry, scintillating optical fibers offer a new way to achieve fine grain sampling and hereby to improve the energy and spatial resolution of a technique still unbeaten for timing and compactness. A small calorimeter element made of planes of 0.9 mm diameter fibers alternating with Pb plates has been built and tested in an electron beam. An energy resolution of σ/sub E/$\sqrt{E} \simeq$ 9.8% and 7.8% was obtained with 1 mm and 0.5 mm Pb plates, respectively. The parameters of the fibers have been measured. Calculations done with a refined version of the EGS code reproduce these results and suggest improved Pb-fiber calorimeters rivalling with Pb glass in energy resolution.

32017 (CONF-850506—6) Digital characterization of particle tracks for microdosimetry. Turner, J.E.; Hamm, R.N.; Hurst, G.S.; Wright, H.A.; Chiles, M.M. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 18p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012898.

From 9. symposium on microdosimetry; Toulouse, France (20 May 1985).

Work is in progress to develop a digital approach to microdosimetry and to construct a prototype instrument to obtain digital information about charged-particle tracks. The objective of such a device is to measure the numbers of electrons produced in various subvolumes of a chamber gas along a particle's path. This paper describes results of Monte Carlo calculations of charged-particle tracks in a cubical time-projection ionization chamber containing methane. Results are presented to show the effects of electron diffusion during charge collection. The calculations indicate that the optimum ratio of field strength and pressure is about 0.6 volts cm^{-1} torr^{-1}. Examples of proton, carbon-ion, and electron tracks are shown. 2 refs., 6 figs.

32018 (DEMO—82/13) Facility for the investigation of (n, charged particle) reactions. Vourvopoulos, G.; Kossionides, E.; Paradellis, T. (Democritos Nuclear Research Center, Athens (Greece)). Dec 1982. 3p. (CONF-820942—40). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701249.

From Nuclear data for science and technology international conference; Antwerp, Belgium (6 Sep 1982).

A system comprised of a gas cell and a magnetic quadrupole triplet was developed for measuring (n, charged particle) reactions. The large (2.68 m) distance between target and detector results in appreciable reduction of the background, while the solid angle (about 15 msr) ensures measurement of small cross sections.

32019 (DEMO—83/5G) Modification of a two-level track follower to a sixteen-gray-level digitizer. Kokkinias, P.; Dris, M.; Dimitriou, N. (Democritos Nuclear Research Center, Athens (Greece)). Apr 1983. 15p. (In Greek). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701510.

In this report we describe the software and hardware development afforded to a track follower system in order to increase its capabilities. Thus the two-level track follower can be used as a sixteen-gray-level digitizer. The information given by the new system consists of two position coordinates on a plane and a number which specifies the gray level at that position. The original system gave only the position coordinates and that only accross tracks.

32020 (DESY—84-120) **Performance of a lead-scintillator sandwich hodoscope with photodiode readout.** Winter, G.G.; Ahme, J.; Marks, J.; Schuetz, D.; Spitzer, H.; Westermann, H.; Greif, H.; Oberlack, H. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Dec 1984. 21p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751635.

Submitted to Nucl. Instrum. Methods.

A matrix of nine lead-scintillator sandwich shower counters with wavelength shifter and photodiode read-out was operated in an electron beam up to 6 GeV. The yield was measured to be 18500-25000 photoelectrons/GeV depending on the shape of the modules. An energy resolution of sigma/√E = 0.105 was observed, the contribution from diode and amplifier noise being 29 MeV. The position resolution was determined as sigma approx.= 3.0 mm for 3 GeV electrons.

32021 (DOE/ER/10624—T2) **[Emulsion spectrometer experiment for B and C particles].** (Oklahoma Univ., Norman (USA)). 1981. Contract AS05-80ER10629. 91p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE85007105.

An experiment is proposed which employs a hybrid emulsion spectrometer to measure lifetimes and decay properties of beauty particles and charmed particles produced by interactions of high energy hadrons. The key to the experiment is a position-sensitive silicon detector. The physics motivation of the experiment and the design of the experimental apparatus and treatment of data are discussed. (LEW)

32022 (DOE/EV/04814—T2) **Development and application of the electrochemical etching technique.** Sanders, M.E. (Georgia Inst. of Tech., Atlanta (USA). School of Mechanical Engineering). Jul 1984. Contract AS05-76EV04814. 119p. NTIS, PC A06/MF A01; GPO Dep. File Number DE85010302.

This report documents the advances achieved in the development and application of several etched damage track plastic dosimeters that can be used to measure dose-equivalent from neutrons with energies from thermal to 20 MeV. The project was initiated with the design of a rem-responding dosimeter that measured fast (> 1 MeV) neutron dose-equivalent as a function of the damage track density directly induced within the volume of polycarbonate foils amplified by electrochemical etching. Stillwagon (1978) adapted electrochemical etching of polycarbonate foils (ECEPF) to alpha dosimetry and used the technique to determine Pu-239 uptake in human bone. Su (1979) extended the usefulness of the ECEPF neutron dosimetry technique to encompass thermal neutron dose measurement. The thermal neutron dosimeter was composed of an external radiator tablet made of ^{7}LiF in contact with a polycarbonate foil and utilized the thermal neutron-induced ^{6}Li(n, α)^{3}H reaction to give a dose-equivalent response as a function of alpha track density registered in the detector foil. An intermediate (1 eV-1 MeV) neutron dosimeter was developed and has been shown to give an approximately dose-equivalent response to neutrons with energies from 1 eV to 17 MeV. The intermediate neutron dosimeter consists of ^{6}LiF-Teflon/CR-39 Polymer foil assembly which is enclosed by a (Cd + In) neutron filter. The neutron dose-equivalent is measured as a variable function of the damage track density registered in the CR-39 detector foil due to alpha particles from the 1/v dependent ^{6}Li(n, α)^{3}H reaction, recoil H, C, O nuclei from neutron-induced elastic scattering within the foil volume, and protons from the ^{6}Li(n, p) reaction for neutron energies above 2 MeV. 46 figs., 6 tabs.

32023 (EGG—10282-2054) **New and revised methods of purifying mercuric iodide.** Skinner, N.; Wedum, E.E. (EG and G, Inc., Goleta, CA (USA). Santa Barbara Operations). 1985. Contract AC08-83NV10282. 21p. (CONF-8505142—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011684.

From American Association of Crystal Growth workshop on purification of materials for crystal growth and glass processing; Watsonville, CA, USA (14 May 1985).

Large single crystals of mercuric iodide are grown by the vapor transport method at EG and G Energy Measurements, Inc., laboratories to provide materials for fabrication of efficient x-ray and gamma ray detectors. Commercially available high-purity mercuric iodide powder must be further purified before it can be used as starting material for the crystal growth process. The "standard" purification procedures we have developed are reviewed, and two methods used in conjunction with this procedure are described. Results are discussed in terms of impurity analyses and detector performance. Sources of mercuric iodide and experiments in progress are outlined.

32024 (IAEA-R—2907-F) **Theoretical and experimental determination of neutron sensitivity for high-pressure ionization chambers filled with CO_2. Final report for the period 1 July 1981-30 June 1984.** Zielczynski, M. (International Atomic Energy Agency, Vienna (Austria)). Sep 1984. 28p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701251.

Neutron sensitivity of high pressure ionization chambers filled with CO_2 was investigated as well as optimum conditions for operations of these chambers. The ion collection efficiency was experimentally determined for gamma, alpha and neutron radiation in CO_2 at pressures ranging from 0.1 to 5.5 MPa and electrical field strengths from 1 to 3000 V/cm. It was confirmed that the Jaffe theory gives a good approximation for high LET particles at pressures above 0.2 MPa. The absorbed dose distributions versus LET in CO_2 for neutrons with energies between 0.1 and 15 MeV were calculated and a formula was developed for calculation of neutron sensitivity, the upper limit of dose rate, the energy characteristics as well as the temperature coefficient. Appropriately designed ionization chambers were then constructed and used for determination of absorbed dose components in fields from typical neutron sources, such as Cf-252 and Pu-Be. By applying appropriate electrical field strength to these ionization chambers, a 10 times reduction of the ratio of neutron-to-gamma radiation sensitivity is achievable due to ion recombination. The optimal pressure of CO_2 was found to be 3.1+-0.5 MPa, when used at temperatures between -5 deg. C and +50 deg. C. At field strengths below 100 V/cm the ratio of neutron-to-gamma sensitivity does not exceed 1% for neutron energies up to 8 MeV. The usefulness of these chambers was confirmed, especially for use in mixed radiation fields with neutrons of restricted energies but unknown energy spectra.

32025 (IPNO—83-04) **Analysis of the statistical operation of a time-numerical code multistop with a resolution of 0.5ns.** Festa, E.; Sellem, R.; Tassan-Got, L. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). 1983. 33p. (In French). NTIS (US Sales Only), PC A03/MF A01. File Number DE85751324.

This article describes a multistop TDC with a resolution of 0.5 ns and a dead time less than 40 ns. The broadening of measured distributions is analyzed and calculated for the real device having a discrepancy in channel width and working randomly with sliding scale effect.

32026 (IPNO-DRE—84-17) **π0-4π. A π^0 high solid angle detector and spectrometer.** Adam, G.S.; Blanpied, C.S.; Bovet, E. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). 1984. 66p. (In French). NTIS (US Sales Only), PC A04/MF A01. File Number DE85751322.

In this report, a new type of π^0 detector is described, the π^0 being produced in intermediate energy, nuclear reactions. The detector has been designed to give a good efficiency, to present a great angular acceptance and to be able to operate in view of an important background. The basic structure is modular and can be improved later on to reach the characteristics of a real π^0 spectrometer.

32027 (KFK—3858) Upgrading the CELLO track detector. Fluegge, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Kernphysik). Jan 1985. 22p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751627.

The CELLO detector and its central tracking detector in particular are described. Improvements and limitations of the detector performance are discussed. A new design optimized for good pattern recognition and momentum and vertex resolution at highest PETRA energies is presented. It consists of a large pressurized all stereo wire chamber (SWC). The hexagonal cells are densely packed in two stereo views at +-2°. A vertex chamber with a thin Be beampipe is an integral part of the drift chamber. Pattern recognition properties and chamber resolutions are discussed. A momentum resolution of 0.5%xp (GeV/c) and a vertex resolution of 120 μm are expected.

32028 (KFKI—1984-81) Thermoluminescent dose measurements on board Salyut type orbital stations. Akatov, Yu.A.; Arkhangelskij, V.V.; Aleksandrov, A.P. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). Jun 1984. 8p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701248.

A small, vibration- and shock-resistant thermoluminescent dosemeter (TLD) system - named PILLE - was developed for orbital stations at the Central Research Institute for Physics, Hungary, to measure the cosmic radiation dose on-board. The first onboard measurements with this system were performed by B. Farkas, the Hungarian astronaut, on the Salyut-6 space station in 1980. The same instrument was used by other crews in the following years. Doses measured at different sites in Salyut-6 are presented. The dose rates varied from 0.7 to 0.11 mGy.day^{-1}. After the first cosmic measurements, the system was further developed. The minimum detectable dose of the new TLD system is 1 μGy, i.e. less by one order of magnitude than that of the former system. The self-irradiation dose rate of the TLD bulbs is also reduced by more than an order of magnitude to 10 nGy.h^{-1}, by use of potassium-free glass for the bulb envelope. This new type of PILLE TLD system is currently on-board Salyut-7. The dose rates (0.12-0.23 mGy.day^{-1}) measured in 1983 are presented in detail.

32029 (LA-UR—85-1476) Observations on ^{3}He neutron spectrometry. Evans, A.E. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 5p. (CONF-850507—3). NTIS, PC A02/MF A01; GPO Dep. File Number DE85010731.

From International conference on nuclear data for basic and applied science; Santa Fe, NM, USA (13 May 1985).

The energy resolution of a ^{3}He ionization chamber, which varies from 13 keV FWHM at 0 keV to approximately 30 keV at 1 MeV, allows abservation of false peaks due to the presence of scattering or absorbing materials and due to accidental near-coincidences of the rather long-risetime detector pulses. Pulse-risetime distributions depend on the neutron beam's angle of incidence to the detector axis; ability to separate ^{3}He-recoil pulses from full-energy ^{3}He(n,p) pulses diminishes for neutrons of energy greater than 1.5 MeV and incident normal to the detector axis. When high-energy neutrons are present, measurement at a grazing angle is recommended.

32030 (MPI-PAE/Exp.El.—142) Silicon strip detectors with capacitative charge division. Koetz, U.; Poesnecker, K.U.; Gatti, E.; Kemmer, J.; Belau, E.; Buchholz, D.; Hofmann, R.; Klanner, R.; Lutz, G.; Neugebauer, E. (Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.). Werner-Heisenberg-Inst. fuer Physik). Nov 1984. 22p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85751136.

Measurements of the behaviour of various high-resolution silicon strip detectors with capacitative charge division have been made in a high-energy particle beam. The results are compared with an electrostatic model which calculates the charges deposited on the strips after the passage of a minimum ionizing particle. Good agreement is found and the model is used to propose a method of improving the charge-division properties of such detectors.

32031 (NAC-AR—84-01, pp 174-175) Report of the Van de Graaff Group: nuclear reactions and nuclear structure. Response of thin film plastic scintillators to fission fragments. Cilliers, W.A.; Brooks, F.D. (Cape Town Univ. (South Africa)); Allie, M.S. 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE85780939.

Short note.

In Annual report June 1984. [Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Center].

32032 (NRCN(TN)—077) New thermal neutron solid-state electronic detector based on HgI_2 crystals. Melamud, M.; Burshtein, Z. (Israel Atomic Energy Commission, Beer-sheba. Nuclear Research Center-Negev). Jul 1983. 29p. (In Hebrew). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701509.

We describe the development of a new solid-state electronic neutron detector, based on HgI_2 single crystals. Incident neutrons are absorbed in high neutron absorbing foils, such as cadmium or gadolinium, which are placed in front of a HgI_2 detector. Gamma rays, emitted as a result of the neutron absorbtion, are then absorbed in the HgI_2, generating free charge carriers, which are collected by the electric field. The advantage of this system lies in it's manufacturing simplicity, low weight and small physical dimensions, compared to gas-filled conventional neutron detectors. The disadvantage is that the system does not discriminate between gamma rays and neutrons. A method to minimize this disadvantage is pointed out. It is as well possible to count neutrons by direct exposure of the HgI_2 to neutrons. The neutron-to-gamma transformation in that case takes place by the material nuclei themselves. This method, however, is impractical due to the interference of delayed radioactivity whose origin are ^{129}I nuclei. They are generated from ^{128}I by absorbing a neutron, and decay with a 25 min half lifetime involving gamma emissions.

32033 (PNL-SA—12901) Beta response of selected instruments. Swinth, K.L.; Rathbun, L.A.; Hooker, C.D.; Roberson, P.L.; Kenoyer, J.L. (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 11p. (CONF-8505103—4). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013278.

From Health Physics Society annual meeting; Chicago, IL, USA (26 May 1985).

The Beta Measurement Evaluation and Upgrade Program managed by Pacific Northwest Laboratory (PNL) for the Department of Energy's (DOE) Office of Nuclear Safety is focusing upon the identification and resolution of problems associated with the measurement of beta dose at DOE facilities. As part of this project, commonly used instruments and instruments under development are being evaluated with regard to their beta response and general performance characteristics. The purpose of this paper is to describe test results for accuracy, beta energy response, angular response and general performance characteristics for selected instruments.

32034 (TRW-SN—39146) Investigation of non-intrusive radiometers for entrained gasifier temperature measurement. Fourth quarterly report, August 1-October 31, 1984. Revision 3. Gat, N. (TRW, Inc., Redondo Beach, CA (USA). Applied Technology Div.). 11 Mar 1985. Contract AC21-83MC20468. 14p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011795.

The objective of this project is to develop and test a nonintrusive radiometer for entrained bed gasifier/combustor temperature measurements. This quarterly report is focused on design, fabrication and testing of radiometers. 3 refs., 5 figs., 1 tab.

32035 **Mark III spectrometer.** Bernstein, D.; Bernstein, J.; Bunnell, K.; Burgueno, G.; Cassell, R.; Collins, B.; Coward, D.; Einsweiler, K.; Eisele, R.; Haber, B. (Stanford Linear Accelerator Center, CA (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment;* **226**: No. 2/3, 301-318(Oct 1984).

This paper describes the design, construction and performance of the Mark III, a new general purpose large solid angle spectrometer at SPEAR, the SLAC 2-8 GeV e^+e^- storage ring. The detector has been designed for the study of exclusive final states in e^+e^- annihilation, which requires large solid angle coverage combined with charged particle momentum resolution, particle identification, and photon detection efficiency at low energies.

32036 **Low-noise amplifier for resolving the right-left ambiguity in drift chambers.** Brown, D. (Los Alamos National Lab., NM (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment;* **226**: No. 2/3, 405-410(Oct 1984).

A low-noise amplifier has been developed for resolving the right-left ambiguity of particle position in delay-line readout drift chambers (DLRDCs). The amplifier provides signals that are proportional to both the sum and difference of two sets of cathode sense wires in a DLRDC. Amplifier risetime is approx.= 18 ns and the input noise is approx.= 6 μVsub(rms). Amplifier design and performance are described.

32037 **Monte Carlo calculation of the average solid angle subtended by a parallelepiped detector from a distributed source.** Wielopolski, L. (Brookhaven National Lab., Upton, NY (USA). Medical Research Center). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment;* **226**: No. 2/3, 436-448(Oct 1984).

A Monte Carlo method utilizing total variance reduction is applied to the calculation of the solid angle subtended by a parallelepiped detector from an arbitrarily positioned point. Although there is an analytical expression for the solid angle subtended by a rectangle from an arbitrary point, the method should prove valuable when a mean solid angle from a distributed source is required. In addition, the algorithm provides an efficient way to sample the directions of gamma rays which intercept a parallelepiped detector, required in the Monte Carlo calculations of the efficiency of square detectors.

32038 **Central drift chamber for the Mark III detector at SPEAR.** Roehrig, J.; Einsweiler, K.; Hutchinson, D.; McNerney, E.; Odian, A.; Skarpaas, K.; Unno, Y.; Villa, F. (Stanford Linear Accelerator Center, CA (USA)); Grancagnolo, F.; Rowe, W. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment;* **226**: No. 2/3, 319-329(Oct 1984).

A large cylindrical drift chamber has been constructed for the MARK III detector at SPEAR. The inner layer has a high density of sense wires for the measurement of kinks, vees, and dE/dx. The outer layers have a cell design with three sense wires, giving uniform drift behavior and left/right ambiguity resolution within a cell. The chamber has both current division and stereo layers for longitudinal position measurement.

32039 **Series-parallel gradiometers for monopole detectors.** Somalwar, S.; Frisch, H.; Incandela, J. (Chicago Univ., IL (USA). Enrico Fermi Inst.; Chicago Univ., IL (USA). Dept. of Physics); Kuchnir, M. (Fermi National Accelerator Lab., Batavia, IL (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment;* **226**: No. 2/3, 341-343(Oct 1984).

We outline a new scheme for designing large planar gradiometers used in monopole searches by induction. With this scheme, the signal falls as $1/\sqrt{L}$ rather than as $1/L$, where L is the inductance of the detector loop. The signal coupling in this scheme is better than is achievable in practice with conventional matching transformers. Also, segmentation facilitates the manufacture of bigger gradiometers. Results from prototype tests are reported and agree with calculation.

32040 **Silicon detectors: New challenges.** Walton, J.T. (Lawrence Berkeley Lab., CA (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment;* **226**: No. 1, 1-11(15 Sep 1984). (CONF-8311154—). Contract AC03-76SF00098.

From 3. European symposium on semiconductor detectors; Munich, F.R. Germany (14 Nov 1983).

An introduction is given to the areas of current interest in silicon radiation detector design and fabrication. Problems associated with detector grade silicon are reviewed. Passivation of detector surfaces with silicon dioxide or amorphous silicon is described. Two examples of silicon detector application in X-ray detection and X-ray angiography are presented.

32041 **Silicon drift chambers - first results and optimum processing of signals.** Gatti, E. (Politecnico di Milano (Italy). Ist. di Elettronica); Rehak, P. (Brookhaven National Lab., Upton, NY (USA)); Walton, J.T. (Lawrence Berkeley Lab., CA (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment;* **226**: No. 1, 129-141(15 Sep 1984). (CONF-8311154—). Contract AC02-76CH00016.

From 3. European symposium on semiconductor detectors; Munich, F.R. Germany (14 Nov 1983).

A Semiconductor Drift Chamber was produced and tested. The paper describes: 1) principle of the chamber operation; 2) the performance of the test chamber; 3) the signal processing to obtain the best position resolution.

32042 **Semiconductor position-sensitive detectors.** Radeka, V. (Brookhaven National Lab., Upton, NY (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment;* **226**: No. 1, 209-218(15 Sep 1984). (CONF-8311154—). Contract AC02-76CH00016.

From 3. European symposium on semiconductor detectors; Munich, F.R. Germany (14 Nov 1983).

Basic concepts for position sensing in particle and photon semiconductor detectors are summarized. Signal and noise criteria are discussed, particularly in view of the trends toward monolithic integration of charge sensing and position readout circuits with the detector.

32043 **Development of high density readout for silicon strip detectors.** Walker, J.T. (Stanford Univ., CA (USA)); Parker, S. (Hawaii Univ., Honolulu (USA)); Hyams, B. (European Organization for Nuclear Research, Geneva (Switzerland)); Shapiro, S.L. (Stanford Linear Accelerator Center, CA (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment;* **226**: No. 1, 200-203(15 Sep 1984). (CONF-8311154—).

From 3. European symposium on semiconductor detectors; Munich, F.R. Germany (14 Nov 1983).

A compact readout for silicon strip detectors is being developed. It employs an nMOS circuit with 128 channels of charge sensitive amplifiers and multiplexed output.

32044 **Update on the TPC at TRIUMF.** Mes, H.; Dixit, M.S.; Hargrove, C.K. (National Research Council of Canada, Ottawa, Ontario. Div. of Physics); Anderson, H.L.; McKee, R.J. (Los Alamos National Lab., NM (USA)); Azuelos, G.; Depommier, P.; Martin, J.P.; Poutissou, R. (Montreal Univ., Quebec (Canada)); Blecher, M. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment;* **225**: No. 3, 547-549(1 Sep 1984). (CONF-8306110—).

From 2. Pisa meeting on advanced detectors; Castiglione della Pescaia, Italy (2 Jun 1983).

Several improvements have recently been made to the TRIUMF TPC. These include the addition of a grid system, corrections to the electrostatic field cage and a sequential gate generator. Our experience with this new TPC will be discussed.

32045 **Search for the best timing strategy in high precision drift chambers.** Va'vra, J. (Stanford Linear Accelerator Center, CA (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment;* **225**: No. 3, 445-453(1 Sep 1984). (CONF-8306110—). Contract AC03-76SF00515.

From 2. Pisa meeting on advanced detectors; Castiglione della Pescaia, Italy (2 Jun 1983).

Computer simulated drift chamber pulses are used to investigate various possible timing strategies in drift chambers. In particular, leading edge, multiple threshold and flash ADC timing methods are compared. Although the presented method is general for any drift geometry, we concentrate our discussion on jet chambers where the drift velocity is about 3-5 cm/μs and the individual ionization clusters are not resolved, due to a finite speed of our electronics. We will not discuss the geometries where the drift time is expanded further and the individual clusters can be recorded (this is covered by a talk by Walenta).

32046 **Semiconductor drift chamber - an application of a novel charge transport scheme.** Gatti, E.; Rehak, P. (Brookhaven National Lab., Upton, NY (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment;* **225**: No. 3, 608-614(1 Sep 1984). (CONF-8306110—).

From 2. Pisa meeting on advanced detectors; Castiglione della Pescaia, Italy (2 Jun 1983).

The purpose of this paper is to describe a novel charge transport scheme in semiconductors, in which the field responsible for the charge transport is independent of the depletion field. The application of the novel charge transport scheme leads to the following new semiconductor detectors: 1) Semiconductor drift chamber; 2) Ultralow capacitance - large area semiconductor X-ray spectrometers and photodiodes; 3) Fully depleted thick CCD. Special attention is paid to the concept of the semiconductor drift chamber as a position sensing detector for high energy charged particles. Position resolution limiting factors are considered and the values of the resolutions are given.

32047 **Lorentz factors for large-mosaic crystals.** Axe, J.D.; Hastings, J.B. (Brookhaven National Lab., Upton, NY). *Acta Crystallographica, Section A: Foundations of Crystallography;* **A39**: 593-594(1983).

General expressions are derived for the Lorentz factor for two- and three-axis spectrometers to be used when the vertical resolution is comparable to or less than the mosaic of the measured Bragg reflections. 3 references, 1 figure.

4402 Radiation Effects On Instrument Components, Instruments, Or Electronic Systems

REFER ALSO TO CITATION(S) 30687

32048 **(AERE-R—10715) Selection of radiation tolerant electrical/electronic components for gamma radiation environments in the nuclear power industry.** Garlick, D.R. (UKAEA Atomic Energy Research Establishment, Harwell. Engineering Projects Div.). Sep 1984. 91p. NTIS (US Sales Only), PC A05/MF A01. File Number DE85701512.

This report briefly describes the mechanisms, units and effects of 1 MeV range gamma radiation on electrical/electronic components and materials. Information is tabulated on the gamma radiation tolerance of a wide range of components and materials. A radiation testing service, based at Harwell, is described. Lists of interested manufacturers and organisations are given.

32049 **(HMI-B—353-Vol.3-Ed.2) GfW-handbook for data compilation of irradiation tested electronic components. Vol. 3.** Wulf, F.; Braeunig, D.; Boden, A. (Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.). Bereich Datenverarbeitung und Elektronik; Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt e.V., Koeln (Germany, F.R.). Bereich fuer Projekttraegerschaften). May 1984. 664p. NTIS (US Sales Only), PC A99/MF A01. File Number DE85780967.

Loose-leaf collection.

The 2nd edition is a continuation of the 1st edition and is published as a loose-leaf handbook. The 1st edition contained 190 test reports. In the volume 1 and volume 2 of the 2nd edition 120 test reports have been published so far. The present volume 3 of the 2nd edition provides further 53 test reports. These test reports of currently in space projects used electronic components have a standardized format. The results are given in a comprehensive but easily to handle graphical and tabular presentation. Statistical values are given in order to facilitate the components life time evaluation in a radiative environment.

32050 **Radiation damage in silicon detectors.** Kraner, H.W. (Brookhaven National Lab., Upton, NY (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment;* **225**: No. 3, 615-618(1 Sep 1984). (CONF-8306110—). Contract AC02-76CH00016.

From 2. Pisa meeting on advanced detectors; Castiglione della Pescaia, Italy (2 Jun 1983).

A review is presented of the effects of radiation damage on silicon detectors, which are being considered for high energy physics applications. The main degradation in performance is an increase in leakage current, which can be well characterized by an empirical damage constant for many radiations. A summary of data on damage constants is given. A brief discussion of annealing effects in terms of band gap level changes is included.

4403 Miscellaneous Instruments

32051 **(EPRI-EL—3984) Underground obstacle detection and mapping system. Final report.** Caldecott, R.; Young, J.D.; Hall, J.P.; Terzuoli, A.J. (Ohio State Univ., Columbus (USA). Electroscience Lab.). May 1985. 258p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920662.

Unless the locations of existing pipe or other underground objects are known, installing or repairing utility systems under city streets can disrupt service and entail risk for work crews. Groundscan, a computerized, radar-based mapping system, scans construction corridors to map the depth and horizontal layout of underground objects.

32052 **(IS-T—1174) Continuum flow sampling mass spectrometer for elemental analysis with an inductively coupled plasma ion source.** Olivares, J.A. (Ames Lab., IA (USA)). Jun 1985. Contract W-7405-ENG-82. 113p. NTIS, PC A06/MF A01; GPO Dep. File Number DE85012255.

Thesis.

The sampling of ions from an atmospheric pressure inductively coupled plasma for mass spectrometry (ICP-MS) with a supersonic nozzle and skimmer is shown to follow similar behavior found for neutral beam studies and for ion extraction from other plasmas and flames. In particular, highest ion beam intensity is found if the skimmer tip is close to the Mach disk and at a calculated skimming Knudsen number close to the recommended value of 1. Our ICP-MS instrument with an off-axis detector and conventional cylindrical electrostatic ion focusing in the transition flow regime gives intense count rates of 1 to 5 MHz per mg L^{-1} of analyte superimposed on a background of 1 to 10 kHz. The dependence of count rates for metal oxide and doubly charged ions on ICP operating parameters, and sampling interface configuration are discussed for this instrument. A simple method is described for the approximate measurement of the ion energy distribution in ICP-

MS. The average ion kinetic energy, kinetic energy spread, and maximum kinetic energy are evaluated from a plot of ion signal as a function of retarding voltage applied to the quadrupole mass analyzer. The effects of plasma operating parameters on ion signals and energies are described. In particular, kinetic energy is a sensitive function of aerosol gas flow rate. This behavior is attributed to a non-thermal, possibly electrical, interaction between the plasma and the sampling interface, which is induced by the presence of the axial channel in the ICP. The interference on the ionization of cobalt by five salts, NaCl, $MgCl_2$, NH_4I, NH_4Br and NH_4Cl, in an ICP is first considered theoretically and subsequently the theoretical trends are established experimentally by ICP-MS. The interference trends are found to be in the order of the most easily ionized element in the matrix salt, i.e., Na > Mg > I > Br > Cl.

32053 (JINR—11-83-531) **Universal control drive unit using micro-computer and its application in the SPN-1 spectrometer.** Bilkenrot, R.; Rodik, Kh.; Shvenkner, V.; Mikhaehlis, B. (Joint Inst. for Nuclear Research, Dubna (USSR)). 1983. 4p. (In Russian). (CONF-8309239—3). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701247.

From 11. international symposium on nuclear electronics; Bratislava, Czechoslovakia (13 Sep 1983).

A control drive unit based on the K 1520 micro-computer is described. It is capable of controlling 16 servomotors, max., and process data from the corresponding transducers. Three servomotors can be controlled at the same time either from the control desk or the controlling computer of an experiment. The software developed for the unit is meant for operating both from the control desk and computer, for processing data from transducers, controlling the position, checking the maximum permissible quantities and correctness of setting operations, some other functions are realized as well.

32054 (KFK—3843) **Test of an optical fibre-laser-photometer with samples of the facility PUTE.** Groll, P.; Persohn, M.; Roemer, J.; Schuler, B. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Heisse Chemie; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Wiederaufarbeitung und Abfallbehandlung). Nov 1984. 32p. (In German). (PWA—81/84). NTIS (US Sales Only), PC A03/MF A01. File Number DE85751140.

The test of a photometer with a dye-laser as light-source is described. The light circuit between laser, optical cell and photodiods uses optical fibre. The concentration of nitric acid has been analyzed by conductivity measurements. Pu-samples of the testing facility PUTE have been analyzed for their concentration of U^{4+}, U^{6+}, Pu^{3+}, Pu^{4+} and free nitric acid. In parallel the same samples have been analyzed by a grating-photometer. The concentration of total uranium and plutonium has been determined by x-ray-fluorescence. The concentration of free acid was analyzed acidimetric. The results of the three methods show excellent agreement for the concentration of plutonium and acid. The deviation is less than 5 g/l. The results of the analysis of uranium deviates more. The results are discussed in detail. 53 figures.

32055 (KFK—3844) **Optical-fiber-laser-photometer for In line measurements in the purex process.** Roemer, J.; Groll, P.; Persohn, M.; Schuler, B. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Heisse Chemie; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Wiederaufarbeitung und Abfallbehandlung). Nov 1984. 42p. (In German). (PWA—82/84). NTIS (US Sales Only), PC A04/MF A01. File Number DE85751141.

An optical-fiber-laser-photometer has been developed. It was thoroughly tested with all components. The used N_2-laser and dyes of the dye laser are very well suited for continuous working. The transmission of the optical fiber is very high in the used wavelength region and decreases to 5 db/m by a radioactive dose of 5 Mrad. The distance between the laser and the measuring cell can be up to 100 m. The reproducibility of the measured transmission without any sample is better then 0.2% without any trend. The analytical results of U-IV- and U-VI-solutions have only a small systematic deviation of 2.0% compared with a non-optical method. The measurements of Pu-III-, Pu-IV- and Pu-III/Pu-IV-solutions are performed in a glove box. They are in good accordance with a titrimetric method. 20 figures.

32056 (LA-UR—84-3578) **Proposed method for remote thermometry in turbine engines.** Noel, B.W.; Cates, M.R.; Allison, S.W.; Borella, H.M.; Franks, L.A.; Marshall, B.R. (Los Alamos National Lab., NM (USA); Oak Ridge Gaseous Diffusion Plant, TN (USA); EG and G, Inc., Goleta, CA (USA)). 1985. Contract W-7405-ENG-36. 7p. (CONF-850712—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85003755.

From 21. AIAA/ASME/SAE joint propulsion conference; Monterey, CA, USA (8 Jul 1985).

The method uses laser-induced fluorescence from a pulsed uv laser to excite a rare-earth-oxide phosphor bonded in a thin layer to the surface to be measured. The luminescent decay times of certain lines are temperature-dependent. Initial results indicate that at least one phosphor, europium-doped yttrium oxide, is usable to 950°C. (DLC)

32057 (LBL—19319) **Applications of holography to x-ray imaging.** Howells, M.; Iarocci, M.; Kenney, J.; Rarback, H.; Rosser, R.; Yun, W. (State Univ. of New York, Stony Brook (USA). Dept. of Physics; Brookhaven National Lab., Upton, NY (USA); Lawrence Berkeley Lab., CA (USA)). Mar 1985. Contract AC02-76CH00016;AC03-76SF00098. 10p. (CONF-850137—3). NTIS, PC A02/MF A01; GPO Dep. File Number DE85010984.

From International Society for Optical Engineering meeting; Los Angeles, CA, USA (21 Jan 1985).

In this paper we consider various applications of holographic techniques to the problem of soft x-ray imaging. We give special attention to imaging biological material using x-rays in the wavelength range 24 to 45A. We describe some experiments on formation and reconstruction of x-ray holograms and propose some ways in which holographic techniques might contribute to the difficult problem of fabricating optical elements for use in the soft x-ray region.

32058 (LMF—113, pp 39-44) **Performance of a single-stage virtual impactor.** Chen, B.T.; Yeh, H.C.; Cheng, Y.S. Dec 1984. NTIS, PC A23/MF A01. File Number DE85009283.

In Inhalation Toxicology Research Institute annual report, October 1, 1983-September 30, 1984.

Aerosol separation characteristics of a single-stage virtual impactor are described. Data indicate that the efficiency curve and the 50% cutoff Stokes number (cutoff size) are insensitive to variations in the nozzle Reynolds number (Re), and can be predicted as long as the corresponding Re is between 1000 and 8000, the ratio of nozzle-to-probe distance to the nozzle diameter (W) is about 1, and the ratio of the hole diameter to W is between 1.2 and 1.5. The results show that the cutoff sizes are affected by the ratio of minor flow rate to the total flow rate. In addition, it was found that there were substantial deposition losses (20 - 40%) on the surface of the collection probe for particles with aerodynamic diameters near the cutoff size. 3 references, 4 figures, 2 tables.

32059 (NAC-AR—84-01, pp 191) **Report of the Van de Graaff Group: nuclear analysis. Standardisation of PIXE equipment.** Peisach, M.; Pineda, C.A. (Cape Provincial Administration). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE85780939.

Short note.

In Annual report June 1984. [Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Centre].

32060 (NAC-AR—84-01, pp 191) **Report of the Van de Graaff Group: nuclear analysis. Construction of XSQR irradiation chamber.** Peisach, M.; Pineda, C.A. (Cape Provincial Administration); Swart, T. 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE85780939.

Short note.

In Annual report June 1984. [Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Centre].

32061 (OEFZS—4306) ELBEST x-ray fluorescence measuring system for on-stream analysis in flotation plants. Donhoffer, D. (Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H. Inst. fuer Isotopenanwendung). Jan 1985. 5p. (In German). (IA—134/85). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701481.

The ELBEST measuring system was developed for continuous onstream measurement of mineral slurries in ore processing plants. The system, which is based on isotope-excited energy dispersive X-ray-fluorescence is described. An application for measurement of Pb/Zn ores in a flotation plant for these ores is given.

32062 (PNL-SA—12863) ELCAP instrumentation. Schuster, G.J.; Tomich, S.D. (Pacific Northwest Labs., Richland, WA (USA)). Apr 1985. Contract AC06-76RL01830;AC79-83BP13795. 7p. (CONF-850175—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013042.

From EPRI end-use metering workshop; Seattle, WA, USA (15 Jan 1985).

Over the past few years Pacific Northwest Laboratory has developed a series of data loggers. The most recently completed logger, designed to meet these requirements, is currently being deployed in the End-Use Load and Conservation Assessment Program (ELCAP), an end-use metering study of 1000 residential and commercial structures in BPA's service territory. This document provides a functional description of the data logger, describing both the main hardware components and the system's software. Application of the logger to power measurements and meteorological and interior condition measurements is discussed along with experience on field performance. A table is provided showing approximate data logger, sensor, and installation costs as experienced in this study.

32063 (SAND—84-2544C) Calibrated Faraday current and magnetic field sensor. Neyer, B.T.; Chang, J.; Lockwood, G.J.; Ruggles, L.E. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 10p. (CONF-850616—38). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013438.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

We have developed a calibrated optical fiber Faraday rotation current sensor. This sensor has a gigahertz response, is immune to electromagnetic interference, and is constructed entirely of dielectric material. All of these advantages make the sensor ideal for pulsed power measurements.

32064 (SAND—85-0548) Calibrator for displacement gages used in the rock mechanics laboratory. McNamee, M.J. (Sandia National Labs., Albuquerque, NM (USA)). May 1985. Contract AC04-76DP00789. 24p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013257.

A system for calibration of LVDT's (linear variable displacement transformer) has been developed for use in the rock mechanics laboratory. The new calibrator system works on an electrical-mechanical principle where a mechanical translator moves a holding fixture, which has provisions for both the calibrator measurement standard, a precision gage head LVDT and the LVDT(s) of interest during the calibration procedure. Output voltages from both the calibrator standard and the gage(s) being calibrated are easily recorded by laboratory computers, making printouts and plots of data a simple task. The new system avoids measurement errors introduced by micrometer thread backlash and spindle sticking associated with previous mechanical systems.

32065 (SAND—85-0841C) Understanding and improving acoustic to seismic coupling as it pertains to Sandia's helicopter detector. Elliott, G.; Fogler, R.J. (Sandia National Labs., Albuquerque, NM (USA)). 18 Mar 1985. Contract AC04-76DP00789. 22p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85009440.

This report covers results to date of an ongoing study undertaken in mid 1984 for the purpose of understanding the basic physics of the acoustic-to-seismic coupling phenomenon involved in the operation of a helicopter detector under development at Sandia National Laboratories. This study has been recently expanded to include assistance from the US Army Waterways Experiment Station and the University of Mississippi. A series of tests were conducted near Albuquerque, New Mexico USA, for the purpose of investigating the coupling phenomenon using an impulsive noise source and two different helicopters. Results of these tests including the evaluation of a new microphone windscreen design are reported.

32066 (UCID—20047) Sorption detector system for chemical agents detection and recognition. Olness, D.; Hirschfeld, T. (Lawrence Livermore National Lab., CA (USA)). 22 Mar 1984. Contract W-7405-ENG-48. 54p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85012775.

The use of the piezoelectric sorption sensor, in which an analyte's absorption in a thin surface layer on a piezoelectric vibrator changes its resonant frequency, has been extensively described. In every instance, the chemical selectivity of the device hinges on that of the absorbing layer. In a complex environment, a few analytes are so distinctive as to permit this. An alternative approach uses an array of crystals (or of vibrational nodes in a microlithographically cut multivibrator) covered with a number of different absorbing layers. These are so thin that they operate in the saturation mode, with different partition coefficients against air resulting in different frequency shifts for each layer. The behavior in Fourier space of these frequency shifts is then used for pattern recognition of individual chemicals. Mixture overlap can then be handled via time derivative measurements, factor analysis, or correlation spectroscopy. Experimental results from this combination of chemometrics and their "Fourier transform mechanical spectroscopy" are given. Experimental results of the demonstrated feasibility of a procedure for providing complete selectivity to quartz piezobalance sensors, by using an array of different sensor layers and pattern recognition, are presented. A laboratory test system, based on this technology, is described.

32067 Fiber-optic spectral-streak equalizer. Reedy, R.P.; Roeske F. Jr.; Smith, D.E. (Lawrence Livermore National Laboratory, University of California, P. O. Box 808, Livermore, California 94550). *Review of Scientific Instruments;* **56**: No. 7, 1356-1362(Jul 1985). Contract W-7405-ENG-48.

A spectral-streak equalizer was developed for use with an electronic streak camera to correct for material dispersion in optical fibers. Material dispersion occurs because different wavelengths of light travel at different speeds through glass fibers; the resulting difference in transit times broadens light pulses, which can lead to errors in certain scientific applications. This new instrument combines optical equalization and streak equalization techniques; it uses an array of optical fibers, as in the optical equalization technique, to partially compensate for the dispersion and uses the streak camera dynamics, as in the streak equalization technique, to complete the compensation. This paper examines the principles of equalization and compares several techniques, enumerates general and specific design considerations, outlines the calibration procedure, details efficiency estimates, describes testing techniques, gives calibration data and test results for spectral-streak equalizers currently in use, and draws conclusions from recent experience with these devices.

32068 Small mass spectrometer probe for analyzing hydrogen ion species. Leung, K.N.; Guethlein, G. (Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Review of Scientific Instruments;* **56**: No. 7, 1480-1481(Jul 1985). Contract AC03-76SF00098.

The characteristics of a small, water-cooled, 90° magnetic deflection mass spectrometer suitable for analyzing positive and negative hydrogen ion species is described.

32069 Composition measurement of aerosols of submicrometer particles by phase fluctuation absorption spectroscopy. Fluckiger, D.U.; Lin, H.; Marlow, W.H. (MIT Lincoln Laboratory, Lexington, Massachusetts 02173). *Applied Optics;* **24**: No. 11, 1668-1681(1 Jun 1985). Contract AC02-76CH00016.

Phase fluctuation optical heterodyne spectroscopy is employed to obtain the first nonextractive data on size-mass distribution of submicrometer ammonium sulfate aerosols. The required theory of aerosol absorption of electromagnetic energy and subsequent thermalization is presented. Based on this theory, the predicted behavior was confirmed by experiments using IR absorption of ammonium sulfate aerosols. The results show good agreement with measurements using conventional methods including condensation nuclei counter, electron micrography, and filtration. In addition, a conversion constant for the photothermal signal of ammonium sulfate aerosols is calculated to be $2.3\ \mu V/(\mu g/m^3)$. Furthermore, the signal is shown to be linear in excitation energy and modulation frequency and scalable.

32070 **Rapid scanning fluorometer based on constant energy synchronous scanning.** Jonell Kerkhoff, M.; Hart, L.P.; Winefordner, J.D. (Department of Chemistry, University of Florida, Gainesville, Florida 32611). *Review of Scientific Instruments;* **56**: No. 6, 1199-1205(Jun 1985).

A rapid scanning fluorometer based on constant energy synchronous fluorescence scanning at 200 nm/s has been developed. Constant energy synchronous fluorescence spectrometry involves measurement of fluorescence as both excitation and emission monochromators are scanned with a constant energy difference being maintained. Spectral information is collected in the forward to reverse directions and is processed in real time. A discussion of the instrumentation and software is given. A theoretical comparison between the photomultiplier tube (PMT) detection system used with this system and a silicon intensified target vidicon (SIT) detection system has been given. Calculations indicate that the signal-to-noise ratio S/N for the PMT system should be about 5—40 x greater than for the SIT system. A comparison of the experimental figures of merit (detection limits, scan speed, analysis time) of the rapid scan constant energy synchronous fluorescence spectrometer with video fluorometers has also been made, again showing the superiority of the rapid scan synchronous system.

32071 **Improved instrument for medium energy electron diffraction and microscopy of surfaces.** Elibol, C.; Ou, H.; Hembree, G.G.; Cowley, J.M. (Department of Physics, Arizona State University, Tempe, Arizona 85287). *Review of Scientific Instruments;* **56**: No. 6, 1215-1219(Jun 1985). Contract AC02-76ER02995.

The REMEDIE system for reflection electron microscopy and electron diffraction at intermediate energies (0.5—20 keV) has been rebuilt with an improved imaging resolution of better than 10 nm, a convenient and versatile system for observation diffraction patterns and provision for specimen preparation and treatment suitable for surface structural studies. The current capabilities of the instrument are illustrated by results obtained from cleaved and annealed silicon (111) surfaces with or without thin deposited silver and gold layers.

32072 **Single-pulse Raman scattering studies of heterogeneous explosive materials.** Trott, W.M.; Renlund, A.M. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Applied Optics;* **24**: No. 10, 1520-1525(15 May 1985). Contract AC04-76DP00789.

Raman scattering from ambient and shock-loaded heterogeneous (compressed pure polycrystalline) explosive materials has been examined using single-pulse laser excitation. In the case of triamino-trinitrobenzene (TATB), intense nonlinear scattering at 1170 cm^{-1} has been observed.

32073 **Measurement and calibration techniques used in computer partial pressure analysis.** Mitchell, D.J. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 527-532(May 1985).

The uses of residual gas analyzers (RGA's) in computer controlled analytical studies and process monitoring applications are discussed in this paper. The relative merits are compared for the two most commonly used RGA's, which are the magnetic sector and the quadrupole mass analyzer. Methods of installing RGA's in vacuum systems and computer interfacing techniques are described. Measurement and calibration methods are outlined for applications where it is desirable to characterize either partial pressures or gas evolution rates. Interpretation of RGA spectra and limitations imposed by analytical errors are also discussed.

32074 **X-ray gauge measures areal density variations as small as 0.1%.** Stupin, D.M. (Materials Science and Technology Division, Los Alamos National Laboratory, Los Alamos, New Mexico, 87545). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1266-1268(May 1985). Contract W-7405-ENG-36.

A gauge measures areal density variations as small as 0.1% in low density plastic foams and other materials. It has a spatial resolution of 0.5 mm. This system is safe, portable, easy to use, and is readily automated. The 6-keV x-ray flux from a ^{55}Fe source is collimated to a 0.5-mm-diameter beam and attenuated by the sample. Transmitted x rays are detected with a proportional gas detector and counted with a scaler-timer. After measuring the x-ray attenuation in two areas of the sample, the areal density variation is calculated using an expression derived from $I/I_0 = \exp(-upx)$, where I is the transmitted flux, I_0 is the incident flux, u is the mass attenuation coefficient of the sample, p is the foam density, x is the thickness of the sample, and the product $px = D$ is the areal density. Measurements sensitive to 1% and 0.1% areal density variations take 3 min and 4 h per point, respectively, in 0.05-g/cm^3 plastics, 1 cm thick. Absolute areal density is also measured to +- 3% using existing x-ray attenuation tables. However, better accuracy may be obtained by calibrating the system with known samples.

32075 **Bistatic LIDAR experiment proposed for the shuttle/tethered satellite system missions.** McComas, D.J.; Spence, H.E.; Karl, R.R.; Horak, H.G.; Wilkerson, T.D. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Review of Scientific Instruments;* **56**: No. 5, 670-673(May 1985).

A new experiment concept has been proposed for the shuttle/tethered satellite system missions, which can provide high-resolution, global density mappings of certain ionospheric species. The technique utilizes bistatic LIDAR to take advantage of the unique dual platform configuration offered by these missions. A tuned, shuttle-based laser is used to excite a column of the atmosphere adjacent to the tethered satellite, while triangulating photometric detectors on the satellite are employed to measure the fluorescence from sections of the column. The fluorescent intensity at the detectors is increased about six decades over both ground-based and monostatic shuttle-based LIDAR sounding of the same region. In addition, the orbital motion of the shuttle provides for quasiglobal mapping unattainable with ground-based observations. Since this technique provides such vastly improved resolution on a synoptic scale, many important middle atmospheric studies, heretofore untenable, may soon be addressed.

32076 **Slit-scan flow cytometer for recording simultaneous waveforms.** Johnston, R.G.; Bartholdi, M.F.; Hiebert, R.D.; Parson, J.D.; Cram, L.S. (Experimental Pathology Group, Mail Stop M888, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Review of Scientific Instruments;* **56**: No. 5, 691-695(May 1985).

We have developed a slit-scan flow cytometer for recording the transient, simultaneous light scattering and fluorescence waveforms from individual metaphase chromosomes flowing through a focused laser beam. The two waveforms are recorded on a single-memory waveform recorder by delaying one of the waveforms and switching between them. The light scattering and fluorescence waveforms contain complementary information on chromosome structure. The delay and switching electronics developed here may be useful in other contexts.

32077 **Computer-controlled device for detection of nuclear resonance in transient radicals in liquids.** Nuttall, R.H.D.; Trifunac, A.D. (Argonne National Lab., IL). *Journal of Magnetic Resonance;* **51**: 118-123(1983). Contract W-31-109-ENG-38.

Modifications are discussed that were made to a Bruker WP80 FT NMR spectrometer to allow transitions among the nuclear sub-levels of transient radicals at any magnetic field to be detected in radicals created in liquid solution during pulse radiolysis. Effects observed in products for reacting radicals can be quite large. The NMR spectrometer had a 20-m cable between the console and magnet to allow placement of the console in the instrument room outside of the vault where samples were irradiated. The only effect on NMR performance was that a 90 pulse for protons was lengthened to approximately 9 sec. The most critical operation to automate was the adjustment of the tuning/matching capacitor setting for each new frequency. It was decided to prepare a calibration table by manually tuning the rf coil and having a computer routine interpolate capacitor settings from those in the table. Two tuning computer routines were written. The modifications have successfully automated the measurement of nuclear spectra of transient radicals using an NMR spectrometer.

32078 (BHR—22) **Analytical model for a pulsed neutron gauge.** Oelgaard, P.L. (Danmarks Tekniske Hoejskole, Lyngby. Afdelingen for Elektrofysik). Sep 1983. 45p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701253.

An analytical model for pulsed-neutron borehole gauges is developed. It takes into account the decrease of the γ-flux due both to thermal neutron absorption and to the movement of the neutrons away from the source. The model is one-dimensional, i.e. the effect of the borehole is not included. The fast neutrons are treated by use of Fermi-age theory, the thermal neutrons by use of diffusion theory. In the present version of the model the γ-detector is assumed to be very close to the pulsed source. The contribution of the scattered capture-γ-quanta to the γ-flux at the γ-detector is calculated by use of build-up factors. Numerical examples of the use of the model are presented. The model is compared with the usual, simplified model which assumes an exponential decay of the γ-detector count-rate. Formulas for the neutron slowing-down time and the thermal neutron lifetime are also presented together with numerical values of these lifetimes for various media of geological relevance.

32079 (PER—81, pp 39-40) **Computerisation of the NUCOR borehole logging unit.** Anderson, N.J.B.; Smit, C.J.B.; Heard, R. Jan 1984. NTIS (US Sales Only), PC A04/MF A01. File Number DE85780942. (CONF-8311245—Absts.).

32080 (AD-A—151737/4/XAB) **Material-response models and ground-motion calculations for high-explosive tests in G-Tunnel tuff. Technical report.** Patch, D.; Fogel, M. (Pacifica Technology, Del Mar, CA (USA)). 25 Jan 1984. 79p. (PT-U—83-0636). NTIS, PC A05/MF A01.

Numerical material-response models developed from static laboratory material-response measurements and from dynamic-explosive test data are described. Material models were first specified using only laboratory test data obtained by Terra Tek. Predictions using this model were then compared to dynamic stress and velocity data taken by SRI International in very small (3/8 gm PETN) explosive shots, and by Sandia Laboratories in a much larger scale (2000 lb. TNT) ONE-TON test. All laboratory measurements and SRI shots used tuff samples taken from the Sandia ONE-TON test site located in G-Tunnel at the Nevada Test Site. A new material model was constructed to agree as closely as possible with the SRI data and a second prediction for the ONE-TON event was made. Overall, the ONE-TON predictions were quite good if the expected bias in air-void content was considered, with the model using the SRI results doing slightly better. The comparisons highlighted concerns about the measured air-void content and uncertainties in the strain-rate dependence of material properties. Models including dilatation and viscoelastic effects were developed, and predictions from these models are compared with the test data. The viscoelastic model was quite successful at both the SRI and ONE-TON scale. The dilatation model had some encouraging features but requires additional data and development.

32081 (AD-A—152012/1/XAB) **Detonations of solid explosives. Final report, 1 November 1982-31 October 1984.** Brener, N.E. (Texas Univ., Arlington (USA)). 28 Dec 1984. 44p. NTIS, PC A03/MF A01.

The main goal of this project is to calculate the activation energy of explosive molecules. Progress has come in the form of four different approaches to the problem: (1) Configuration interaction method; (2) Guassian 82 Computer program; (3) MNDOOC procedure; and (4) Green's function techniques. Access is available to the first Cray version of Dr. Henry F. Schaefer's CI programs and to several large Cray computers on which to run the programs. As a result, very large and highly accurate CI calculations are expected on explosive molecules of interest. The Guassian 82 Computer Program is generally considered to be state-of-the-art program in the area of Moller-Plesset perturbation theory. A new Cray version of Guassian 82, not yet available to the general scientific community, is expected to yield activation-energy calculations that are better and more accurate values than those previously possible using Guassian 82. The MNDOC method, a new correlated version of the MNDO method, has been used to compute accurate values for the activation energy of methyl nitrate. Green's function theory has been used to derive a new one-electron equation that goes beyond previous one-electron equations to include higher-order correlation terms. As correlation plays a very important part in molecular reactions, this new equation is expected to lead to significant improvements in the calculation of molecular activation energies.

32082 (LA-UR—84-2753) **Theory of dense molecular fluid equations of state with application to detonation products.** Shaw, M.S.; Johnson, J.D.; Holian, B.L. (Los Alamos National Lab., NM (USA)). 1984. Contract W-7405-ENG-36. 4p. (CONF-850706—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE84016822.

From 8. international symposium on detonation; Albuquerque, NM, USA (15 Jul 1985).

Because of the uncertainty in using spherical potentials, a series of benchmark calculations was made using molecular dynamics with realistic anisotropic potentials. The configurational part of the Helmholtz free energy for an anisotropic molecular system can be obtained by using an equivalent spherical potential. Such potentials were obtained for N_2, O_2, NO, CO, and CO_2. (DLC)

32083 (LA-UR—85-742) **Three-dimensional hydrodynamic hot-spot model.** Mader, C.L.; Kershner, J.D. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 10p. (CONF-850706—6). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85009587.

From 8. international symposium on detonation; Albuquerque, NM, USA (15 Jul 1985).

The interaction of a shock wave with a single air hole and a matrix of air holes in PETN, HMX, and TATB has been numerically modeled. The hot-spot formation, interaction, and the resulting buildup toward detonation were computed using three-dimensional numerical Eulerian hydrodynamics with Arrhenius chemical reaction and accurate equations of state according to the hydrodynamic hot-spot model. The basic differences between shock sensitive explosives (PETN, HMX) and shock insensitive explosives (TATB, NQ) may be described using the hydrodynamic hot-spot model. The reactive hydrodynamics of desensitization of heterogeneous explosives by a weak preshock has been numerically modeled. The preshock desensitizes the heterogeneous explosive by closing the air holes and making it more homogeneous. A higher pressure second shock has a lower temperature in the multiple shocked explosive than in single shocked explosives. The multiple shock temperature may be low enough to cause a detonation wave to fail to propagate through the preshocked explosive. 10 refs., 12 figs.

32084 (LA-UR—85-769) Modeling heterogeneous high explosive burn with an explicit hot-spot process. Tang, P.K.; Johnson, J.N.; Forest, C.A. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 11p. (CONF-850706—5). NTIS, PC A02/MF A01; GPO Dep. File Number DE85009593.

From 8. international symposium on detonation; Albuquerque, NM, USA (15 Jul 1985).

We present a method of treating high explosive burn with a multi-step process which includes the hot-spot excitation, decomposition, and the propagation of reaction into the region outside the hot spots. The basic features of this model are the separation of the thermal-mechanical and chemical processes, and the partition of the explosive into hot spots and the region exclusive of the hot spots. The thermal-mechanical aspects are formulated in a way similar to the chemical process. The combined processes lead to a set of rate equations for the mass fractions of reactants, intermediate states, and final products. The rates are expressed initially in terms of general characteristic times, but with specific phenomenological correlations introduced in the final model. Computational examples are given of simulated flyer plate impacts, short-shock initiation, corner turning, and shock desensitization. 19 refs., 9 figs.

32085 (LA-UR—85-860) Real time analysis of PETN detonation products. Blais, N.C.; Valentini, J.J. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 8p. (CONF-850706—8). NTIS, PC A02/MF A01; GPO Dep. File Number DE85009581.

From 8. international symposium on detonation; Albuquerque, NM, USA (15 Jul 1985).

The freely expanding gases from the detonation of pentaerythritol tetranitrate (PETN) pellet were analyzed as rapidly as the molecules arrived at the mass spectrometer detector. It was found that all of the products arriving at the detector earliest, irrespective of mass, had the same velocity, 11 km s^{-1} and peaked at 5 km s^{-1}. The width of the time distributions varied from one species to another. Mass and velocity spectra of the important products were obtained and the most intense signals were found to be H_2O, CO, and CO_2, but H_2O was by far the largest. Smaller signals arising from O, HCN, HCO, and NO_2 were also found. Comparisons of the spectrum with other experiments are discussed. 8 refs. 5 figs.

32086 (LA-UR—85-1023) Effect of precipitation variables on the specific surface and explosion characteristics of pentaerythritol tetranitrate. Dinegar, R.H. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 11p. (CONF-850742—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85009620.

From International Pyrotechnics Society symposium; Karlsruhe, F.R. Germany (3 Jul 1985).

The particle size, shape, and texture of the crystals of pentaerythritol tetranitrate (PETN) precipitated from acetone solutions by the addition of water depend upon many crystallization factors. Among the most important of these are 1) the concentration of PETN in the acetone, 2) both the volume of water and the rate at which the nonsolvent is added, and 3) the amount of agitation of the solution during the precipitation process. Fortunately, all of these conditions can be controlled easily because the explosion characteristics of PETN are strong functions of the crystal description. This paper quantitatively describes the effect of precipitation conditions on the type of PETN crystals obtained and the variation of both explosive sensitivity and explosion time with one important quantitative measure of crystal description: the area per unit mass or specific surface. 2 refs., 2 figs., 8 tabs.

32087 (LA-UR—85-1088) Electron density distribution analysis for nitroguanidine. Ritchie, J.P.; Cromer, D.T.; Stewart, R.F.; Wasserman, H.J.; Ryan, R.R. (Los Alamos National Lab., NM (USA); Carnegie-Mellon Univ., Pittsburgh, PA (USA). Dept. of Chemistry). 1985. Contract W-7405-ENG-36. 10p. (CONF-850706—4). NTIS, PC A02/MF A01; GPO Dep. File Number DE85009598.

From 8. international symposium on detonation; Albuquerque, NM, USA (15 Jul 1985).

The electron density distribution of nitroguanidine was analyzed with both experimental and theoretical techniques to determine how well these methods would work for an explosive molecule. Explosives present special problems with these methods because many atoms are usually involved, which can cause the calculations to become intractable, and because the molecules have many polar bonds. We found that, although the polar character of the space group made the experimental analysis difficult, the two techniques yielded results very much in harmony. Specifically, electrostatic potentials, which play a large role in determining crystal geometry, were in very good agreement. A discrepancy, however, was observed between the theoretically optimized geometry and the observed geometry. This discrepancy appears to be the result of crystal packing forces which are not present in the theoretical calculations. We also observed some similarities between the hydrogen-bond network in NQ and that in TATB. 14 refs., 9 figs., 2 tabs.

32088 (LA-UR—85-1122) Detonation in tungsten-loaded HMX. Goldstein, S.; Mader, C.L. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 7p. (CONF-850706—7). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85009606.

From 8. international symposium on detonation; Albuquerque, NM, USA (15 Jul 1985).

The detonation behavior of X-0233, a heavily tungsten-loaded HMX explosive, has been studied using failure diameter measurements, plate dents, and aquarium tests. A model with features resembling those of a weak detonation describe the experimental results. 7 refs., 10 figs.

32089 (LA-UR—85-1130) Intermolecular explosives. Akst, I.B. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 11p. (CONF-850706—10). NTIS, PC A02/MF A01; GPO Dep. File Number DE85009609.

From 8. international symposium on detonation; Albuquerque, NM, USA (15 Jul 1985).

The steady-state detonation characteristics of a few intermolecular explosives are examined along with results of wedge experiments on initiation and reaction growth in one system (EAK), toward a better understanding of this class of explosives. The importance of factors such as products and their states, and temperature, to performance of these systems and explosives in general is discussed. Hydrogen compounds may be superior enough to carbon and its compounds as fuels and products for quick metal-accelerating explosives that the effect of the generally lower density is offset. High temperatures and condensation of solid products are probably the main causes of late appearance of energy in metal motion. The unusual shock sensitiveness and explosiveness of EAK are indicated by wedge results including pseudo-Pop-plots of overtaking waves, and by plots of shock velocity versus transit distance in the wedges. 20 refs., 10 figs., 2 tabs.

32090 (LA-UR—85-1390) Sensitivity and performance characterization of DINGU. Stinecipher, M.M.; Stretz, L.A. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 7p. (CONF-850706—18). NTIS, PC A02/MF A01; GPO Dep. File Number DE85010750.

From 8. international symposium on detonation; Albuquerque, NM, USA (15 Jul 1985).

DINGU, as a relatively insensitive high explosive (HE), may have interesting applications. We have been working on better methods for preparation and characterization. We have achieved a particle size suitable for formulating this compound into a PBX and have tested DINGU/binder by plate dent. We have compared the sensitivity of DINGU with that of TATB in small-scale tests. 14 refs., 2 figs., 3 tabs.

32091 (MLM—3252) Friction, impact, and electrostatic discharge sensitivities of energetic materials. Wang, P.S.; Hall, G.F. (Monsanto Research Corp., Miamisburg, OH (USA). Mound). 31 May 1985. Contract AC04-76DP00053. 21p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013321.

Impact, friction, and electrostatic discharge sensitivities of energetic materials (explosives and pyrotechnics) used or manufactured at Mound were tested by the "one-shot" method. The Bruceton statistical method was used to derive 50% initiation levels, and the results were compared. The materials tested include: PETN, HMX, Plastic Bonded Explosives (PBX), CP, TATB, RX26BB, RX26BH, barium styphnate, LX-15, LX-16, Ti/$KClO_4$, TiH/sub 0.65//$KClO_4$, TiH/sub 1.65//$KClO_4$, Fe/$KClO_4$, TiH/sub 1.75// B/$CaCrO_4$, Ti/B/$CaCrO_4$, B/$CaCrO_4$, TiH/sub 0.65//2B, TiH/sub 0.65//3B, 2Ti/B, TiH/sub 1.67//2B, Ti/2B, TiH/sub 1/67//3B, Ti/B, and Ti/3B. Some samples were investigated for aging effects, physical variables, and the effect of manufacturing paramters on sensitivities. The results show that in both friction and impact tests, CP and barium styphnate are the most sensitive; TiH/sub 1.65/ $KClO_4$, LX-15, TATB and its related materials are the least sensitive; and other materials such as PETN and HMX are in the midrange. In the electrostatic tests of Ti-based pyrotechnics, a decrease of sensitivity with increasing hydrogen concentration was observed. 20 refs., 12 figs., 7 tabs.

32092 (SAND—84-1825C) Pressure-shear loading of PBX-9404. Chhabildas, L.C.; Kipp, M.E. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 19p. (CONF-850706—15). NTIS, PC A02/MF A01; GPO Dep. File Number DE85009982.

From 8. international symposium on detonation; Albuquerque, NM, USA (15 Jul 1985).

Pressure-shear loading techniques have been used to obtain estimates of dynamic shear strength of PBX-9404 over the stress range of 0.3 to 1.0 GPa. One dimensional pressure-shear waves were generated with a single-stage compressed gas gun. The gun was used to obtain normal impact of a projectile on a Y-cut quartz crystal with an explosive sample bonded to its rear surface. The anisotropic nature of the Y-cut quartz results in a two-wave structure having particle velocities in both the longitudinal and transverse directions. Results of these experiments indicate that a maximum shear stress of 0.04 GPa is obtained over the stress range studied. The pulse amplitude and the sample thickness in the present experiments are not optimal to investigate the reaction sensitivity to shear loading. Numerical simulations of these experiments based on an existing thermomechanical model and an elastic, perfectly plastic model, are also reported. 23 refs., 7 figs.

32093 (SAND—84-1844C) Explosive initiation by very small conical shaped charge jets. Vigil, M.G. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 11p. (CONF-850706—9). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85009443.

From 8. international symposium on detonation; Albuquerque, NM, USA (15 Jul 1985).

Very small conical shaped charge (CSC) jets were used to initiate four different secondary explosives. The liner thicknesses varied between 0.076 and 0.127 mm. LX-13 (80% PETN and 20% SYLGARD) explosive was used to drive the conical liners to form the CSC jets. The CSC jet velocities varied between 3.6 and 6.5 mm/μs. The jet tip diameters ranged between 0.041 and 1.10 mm. The explosive acceptor or target diameters were varied between 1.90 and 19.1 mm. The lateral confinement of the acceptor explosives was minimal. Relationships for critical jet initiation energy and dimensionless explosive/jet parameter as a function of initiation parameters are developed. The jet initiation data from this investigation as well as previously published data are shown to be consistent with the developed relationships. The threshold initiation parameter (jet velocity squared times jet diameter) for LX-13, PETN, PBX-9407, and TETRYL were experimentally determined to be 0.011, 0.0130, 0.041, and 0.044 $cm^3/\mu s^2$, respectively, for copper jets impacting bare explosive acceptors. The lower values for the LX-13 and PETN indicate these two explosives are more sensitive to shock initiation than PBX-9407 and TETRYL explosives. 14 refs., 9 figs., 6 tabs.

32094 (SAND—84-1860C) Modeling granular explosive detonations with shear band concepts. Kipp, M.E. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 8p. (CONF-850706—20). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011823.

From 8. international symposium on detonation; Albuquerque, NM, USA (15 Jul 1985).

In theories that are formulated to describe shock-induced reactions in granular explosives, it is necessary to identify and model mechanisms that contribute to the growth or decay of the reaction. The concept of hot spot formation and subsequent reaction is examined on the basis of recent work on shear-band nucleation. In this context, the energy dissipated by the shock preferentially heats a volume fraction of the material to a relatively high local temperature. Heat conduction takes place driving the temperatures toward equilibrium, in competition with the reaction of the heated material. As the amplitude of loading increases, the volume of nucleated hot material also increases, thus decreasing the volume of cold material remaining that must decompose by grain burning. 17 refs., 6 figs.

32095 (SAND—85-0761C) Experimental studies of chemical reactivity during shock initiation of hexanitrostilbene. Setchell, R.E. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 40p. (CONF-850706—19). NTIS, PC A03/MF A01; GPO Dep. File Number DE85011726.

From 8. international symposium on detonation; Albuquerque, NM, USA (15 Jul 1985).

A new experimental approach has been used to examine the release of chemical energy during shock initiation of hexanitrostilbene (HNS). In this approach, the intensity of visible emission from an explosive/window interface, integrated over the spectral range of 550 to 800 nm, was recorded in time as a measure of local chemical reactivity at this interface. Simultaneously, VISAR measurements were made of the particle velocity of the same interface in order to examine the relative effect of the energy release on the wave motion. Sustained and short-duration shocks, having pressures from 2.3 GPa to 4.0 GPa, were generated in two types of HNS materials that previously have shown significant differences in shock sensitivity. The emission intensity was found to be a very sensitive indicator of chemical reactivity. The combined measurements indicate that the temporal and spatial behavior of energy release during shock initiation is quite different in the two types of HNS. 21 refs., 15 figs.

32096 (UCRL—92102) Comparison of experimental data on detonation velocity and Chapman-Jouget pressure vs initial HE density with predictions from Ree's model equation of state. Steinberg, D.J. (Lawrence Livermore National Lab., CA (USA)). Feb 1985. Contract W-7405-ENG-48. 11p. (CONF-850706—2). NTIS, PC A02/MF A01; GPO Dep. File Number DE85007266.

From 8. international symposium on detonation; Albuquerque, NM, USA (15 Jul 1985).

Data on the change of detonation velocity and Chapman-Jouget pressure vs initial HE density for RDX and HMX have been compared with the theoretical predictions of Ree for PBX 9404. Ree's model predicts breaks or changes in the slope of these curves due to the solidification of carbon and the formation of a separate, nitrogen-rich phase. There is good evidence for the solidification of carbon at rho$_0$ about 1.15 g/cc, but the evidence for the nitrogen phase separation at rho$_0$ about 1.56 g/cc is conflicting. 14 refs., 6 figs., 1 tab.

32097 Vapor explosions: a critical review. Bankoff, S.G. Evanston, IL; Northwestern University ([1985]). 6p.

Four stages of the vapor explosion phenomenon are distinguished: premixing, triggering, escalation and propagation. Fauske proposed that spontaneous nucleation upon contract of the hot and cold liquids was a necessary condition for the first three stages, while Board, Hall and Hall have proposed a thermal detonation theory based upon purely hydrodynamic fragmentation behind the shock front for the fourth stage. The evidence concerning both concepts is discussed, and some tentative conclusions drawn. Some data relevant to the triggering and escalation steps, together with some brief comments concerning cyclic propagation models, are presented.

32098 **(AD—354288/3/XAB) High-altitude nuclear-detonation optical infrared effects.** Gauvin, H.P.; Cahill, J.P.; Grenier, J.W.; Carpenter, J.W. (Air Force Geophysics Lab., Hanscom AFB, MA (USA)). 14 Oct 1964. 384p. NTIS, PC A17/MF A01.

Report on Operation Dominic. Fish Bowl Series. Project 8A.1 (U).

Optical-IR radiation data were obtained on Shots Star Fish Prime, Check Mate, Blue Gill Triple Prime, King Fish, and Tight Rope from both aircraft stations and Johnston and Maui Island stations. The spectral radiance observed by each channel for each shot is presented in graphical form as a function of time. In general, data are presented from approximately H + 25 msec to as long as a signal above background was observed. No data on the initial pulse (H + 0.5 msec to approximately H + 25 msec) are shown.

32099 **(AD—360457/6/XAB) Piggyback satellite packages.** Bena, R.A.; Baker, K.; Giacconi, R.; Gursky, H.; Hinteregger, H. (Air Force Geophysics Lab., Hanscom AFB, MA (USA)). 3 May 1965. 270p. NTIS, PC A12/MF A01.

Report on Operation Dominic, Fish Bowl Series, Project 6.12 (U).

The purpose of the measurements proposed by Project 6.12 was to investigate the spread of fission debris around the globe and its effects on ionization and radio noise. It was assumed that for the high-altitude shot the fission debris would expand from the detonation point until it was stopped either by the magnetic containment or, in the case of downward-moving debris, by the denser air, causing ionization. A high content of atomic ions is formed in this way around 200 km in height and, due to the low recombination rate, is only slowly removed. The fission products eventually spread around the earth and, if charged, will form a belt. Another belt produced by the trapped fission betas is formed even faster. This belt was expected to emit synchrotron noise. To make these measurements of the world-wide and long-time effects, Discoverer satellites were instrumented with specially designed research packages. Because of the difficulties and schedule slippages encountered in attempting the nuclear detonations, this project was not able to obtain data during the time of primary interest.

32100 **(AD—473909/0/XAB) Operation Crossroads. Atomic bomb tests Able and Baker conducted at Bikini Atoll, Marshall Islands on 1 July 1946 and 25 July 1946. Volume 1. History of Director of Ship Material report.** (Joint Task Force One, Washington, DC (USA)). 1946. 156p. (XRD—189). NTIS, PC A08/MF A01.

See also Volume 3, AD-473 910.

The purpose of this history is to provide a general, nontechnical introduction to the voluminous technical reports evolving from Operation Crossroads. There are many reasons for such a history but it is enough to say here that any assessment of results in a large test operation must take into account in some manner how the results were obtained. The history, therefore, provides a chronological account of the effort, extending over a period of eight months, which the groups under the Director of Ship Material, as well as some other closely related groups, put forth to obtain the results that lie behind the technical reports.

32102 **(AD-A—151712/7/XAB) Laboratory investigation of containment of underground explosions. Technical report.** Cizek, J.C.; Florence, A.L. (SRI International, Menlo Park, CA (USA)). Dec 1983. 254p. NTIS, PC A12/MF A01.

In support of the DNA program for stemming and containment of underground nuclear tests, laboratory techniques were applied to investigate the mechanics of containing gases in cavities formed by underground nuclear explosions. One experimental technique uses constant-flow-rate hydrofracture from a central exploded cavity in a cylinder of geologic material or simulant externally pressurized to represent overburden. A second experimental technique uses the measurement of particle velocity in the material surrounding an exploded cavity to provide outward and rebound motion at several radii for geologic materials and simulants. Additional experimental techniques use direct measurements of the transient and long-term stress and strain surrounding an exploded cavity. Hydrofracture, particle velocity, stress, and strain results for a rock-matching grout representing saturated Nevada Test Site tuff show the following: a beneficial residual stress forms around and exploded cavity, and containment of gases is achieved at normal overburden. Permanent-volume compression exists in the region surrounding an exploded cavity. Containment may be possible with depth-of-burial and overburden less than those of normal practice. Strain-rate changes do not have significant effect on particle velocity when the scale factor is doubled.

32103 **(AD-A—152188/9/XAB) Analysis of radiation exposure for naval personnel at Operation Sandstone. Technical report.** Thomas, C.; Goetz, J.; Stuart, J.; Klemm, J. (Science Applications International Corp., McLean, VA (USA)). 15 Aug 1983. 52p. (SAI—83/1055). NTIS, PC A04/MF A01.

Radiation environments are reconstructed for Task Group 7.3 ships and the residence islands of Enewetak and Kwajalein Atolls resulting from the three nuclear detonations comprising Operation SANDSTONE (April-May 1948). Secondary (late-time) fallout was the source of virtually all of the radioactive contamination on the ships and islands, most of which resulted from Shots X-RAY and YOKE. Fallout from Shot ZEBRA was minimal. From the reconstructed free-field radiological environments, an equivalent personnel film badge dose is calculated and compared to actual dosimetry data obtained during the operation. Calculated doses and dosimetry are consistent, although most of the calculated and film badge doses are below film badge threshold.

32104 **(INIS-mf—9296) Densification and reactivity enhancement during the ignition of nuclear weapons. Pt. 1. An analytical approximation of the Guderley implosive densification.** Hafner, P. (Fraunhofer-Gesellschaft zur Foerderung der Angewandten Forschung e.V., Euskirchen (Germany, F.R.). Inst. fuer Naturwissenschaftlich-Technische Trendanalysen). Jul 1982. 41p. (In German). NTIS (US Sales Only), PC A03/MF A01. File Number DE85780927.

An analytical approximation is presented to describe the strongly convergent densification shock front in an ideal gas. With the model of an ideal medium, which is compressed with constant velocity at the boundary, and the similarity characteristics of the shock wave front it is assumed, that all particles move independently with their velocities obtained in the shock wave front. With this assumption, which primarily is valid for an implosion shock, the hydrodynamic equations can be solved analytically to give a simple description of the total flow field. For the case of the spherically symmetric compression shock the results are presented for different adiabate coefficients. (orig.).

32105 **(ORNL/Sub—83/43374/1/V3) Study to assess the effects of magnetohydrodynamic electromagnetic pulse on electric power systems. Phase I, final report. Volume 3.** Legro, J.R.; Abi-Samra, N.C.; Tesche, F.M. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Advanced Systems Technology Div.). May 1985. Contract AC05-84OR21400. 135p. NTIS, PC A07/MF A01. File Number DE85011301.

In addition to the initial transients designated as fast transient high-altitude EMP (HEMP) and intermediate time EMP, electromagnetic signals are also perceived at times from seconds to hundreds of seconds after a high-altitude nuclear burst. This signal has been defined by the term magnetohydrodynamic-electromagnetic pulse (MHD-EMP). The MHD-EMP phenomena has been both detected in actual weapon tests and predicted from theoretical models. This volume documents a preliminary research effort to investigate the nature and coupling of the MHD-EMP environments to electric power systems, define the construction of approximate system response network models, and document the development of a unified methodology to assess equipment and systematic vulnerability. The MHD-EMP environment is compared to a qualitatively similar natural event, the electromagnetic environment produced by geomagnetic storms.

32106 **(UCID—20423) Evaluation framework for Comprehensive Test Ban Treaty seismic verification systems.** Younker, L.; Hannon, J.; Springer, D.; Al-Ayat, R.; Judd, B.; Morris, P.; Sandling, J. (Lawrence Livermore National Lab., CA (USA)). Apr 1985. Contract W-7405-ENG-48. 45p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85013364.

This report describes an analytic framework for evaluating the capabilities of seismic systems for verifying future treaties limiting nuclear weapons tests. The framework, which is based on decision analysis, is intended to assist policy makers in formulating and evaluating political decisions and research alternatives related to seismic verification. An illustrative evaluation is provided for two types of seismic systems, which are part of an in-country Regional Seismic Verification System. The evaluation incorporates a variety of issues, including detection capabilities, evasion possibilities, evidence produced by the systems, US response to the evidence, and relative values of possible outcomes to the US and foreign countries. Methods are provided to quantify the effectiveness of the systems in assuring treaty compliance and deterring violations. The primary advantages of the framework are that it provides a systematic method for examining technical issues, incorporating value and cost tradeoffs, and analyzing alternate judgments. The framework is being refined to incorporate, for example, the role of on-site inspections and information provided by other sources that supplements seismic evidence. Applications of the framework to decisions related to treaty negotiations are being explored.

32107 **(UCRL—92523) Smoke inputs to climate models: optical properties and height distribution for nuclear winter studies.** Penner, J.E.; Haselman, L.C. Jr. (Lawrence Livermore National Lab., CA (USA)). Apr 1985. Contract W-7405-ENG-48. 27p. (CONF-8408122—3). NTIS, PC A03/MF A01; GPO Dep. File Number DE85011363.

From 4. international conference on nuclear war; Erice, Sicily, Italy (19 Aug 1984).

Smoke from fires produced in the aftermath of a major nuclear exchange has been predicted to cause large decreases in land surface temperatures. The extent of the decrease and even the sign of the temperature change depend on the optical characteristics of the smoke and how it is distributed with altitude. The height distribution of smoke over a fire is determined by the amount of buoyant energy produced by the fire and the amount of energy released by the latent heat of condensation of water vapor. The optical properties of the smoke depend on the size distribution of smoke particles which changes due to coagulation within the lofted plume. We present calculations demonstrating these processes and estimate their importance for the smoke source term input for climate models. For high initial smoke densities and for absorbing smoke (m = 1.75 - 0.3i), coagulation of smoke particles within the smoke plume is predicted to first increase, then decrease, the size-integrated extinction cross section. However, at the smoke densities predicted in our model (assuming a 3% emission rate for smoke) and for our assumed initial size distribution, the attachment rates for brownian and turbulent collision processes are not fast enough to alter the smoke size distribution enough to significantly change the integrated extinction cross section. Early-time coagulation is, however, fast enough to allow further coagulation, on longer time scales, to act to decrease the extinction cross section. On these longer time scales appropriate to climate models, coagulation can decrease the extinction cross section by almost a factor of two before the smoke becomes well mixed around the globe. This process has been neglected in past climate effect evaluations, but could have a significant effect, since the extinction cross section enters as an exponential factor in calculating the light attenuation due to smoke. 10 refs., 20 figs.

4503 Explosion Detection

32108 **(AD-A—151162/5/XAB) Testing the hypothesis of TTBT (Threshold Test Ban Treaty) compliance, and magnitude-yield regression for explosions in granite. Final technical report, 15 November 1982-30 December 1984.** Shumway, R.H.; Rivers, D.W. (Teledyne Geotech, Alexandria, VA (USA)). 30 Dec 1984. 53p. (AL—84-7). NTIS, PC A04/MF A01.

Verification of the Threshold Test Ban Treaty (TTBT) cannot be performed merely by estimating explosive yields on the basis of observed seismic magnitudes and concluding that a violation has occurred if one or more yield estimates exceed the TTBT limit of 150 kt. It is necessary to take into account the uncertainties in the seismic magnitudes, in the magnitude - yield relation, and especially in the magnitude bias between the test site at which the magnitude - yield calibration explosions were detonated and the test site of the explosions being monitored. For monitoring one explosion at a time, these uncertainties can be taken into account by placing confidence limits around the yield estimates. For verifying TTBT compliance of an ensemble of explosions considered as a whole, however, this technique cannot be used, since the confidence limits placed around the yield estimates of different explosions are correlated due to the use in every case of the same values of the parameters relating magnitude to yield. In order to examine TTBT compliance for groups of explosions, a test can be performed of the hypothesis that the yields have some fixed distribution in which all the values are less than 150 kt.

32109 **(AD-A—151367/0/XAB) Frequency dependence of q in the mantle underlying the shield areas of Eurasia. Final technical report, 15 November 1982-30 December 1984.** Der, Z.A.; Lees, A.C.; Cormier, V.F.; Anderson, L.; Burnetti, J. (Teledyne Geotech, Alexandria, VA (USA)). 11 Jan 1985. 148p. (AL—85-1). NTIS, PC A07/MF A01.

In Part I the results of short- and intermediate-period data analyses for the determination of a frequency-dependent Q model of the mantle under the shield areas of Eurasia are presented. The spectra of short-period P waves from nuclear explosions in the 1-8 Hz frequency range give t* sub p = approx. 0.15-0.2 seconds. Part II presents analyses of long-period data. Long-period multiple S and ScS phases observed in northern Europe were analyzed to determine mantle attenuation in the 0.02- to 0.2-Hz range under the Eurasian shield. Two groups of events are used: deep Far-Eastern earthquakes and large earthquakes near the edges of the shield areas of Eurasia. Part III provides the Q model. A large set of broadband data was analyzed to determine the frequency and depth dependence of Q for P and S waves under the northern shield areas of Eurasia. A wide range of techniques utilizing spectra, amplitude ratios and waveform modeling were used to derive apparent and absolute t* estimated for P and S waves covering the seismic band between 0.01 to 10 Hz. A supplement discusses methodologies for estimating t*(f) from Short-Period Body Waves and Regional Variations of t*(f) in the United States.

32110 **(UCID—20381) Marine Sample Exploitation Project: estimates regarding the sensitivity and technology for the detection of nuclear explosion debris in the marine environment.** Marsh, K.V.; Buddemeier, R.W. (Lawrence Livermore National Lab., CA (USA)). 4 Jun 1985. Contract W-7405-ENG-48. 11p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013176.

The report discusses the possibility of detecting a small nuclear explosion in which most of the fission products are released to the ocean. The use of marine plankton as bioaccumulators is proposed to deal with the problem of dilution. 7 refs. (ACR)

32111 **(EPRI-EL—3972) Estimation of design wind speeds from short-term records. Final report.** Grigoriu, M. (Cornell Univ., Ithaca, NY (USA). Dept. of Structural Engineering). May 1985. 63p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920651.

Conventional methods of estimating wind speed for the design of transmission lines require data collected over 20 to 30 years. Using the method developed in this study, engineers can estimate design wind speeds from as few as 3 years of data. The proposed method had an average error of less than 1% for the 42 weather stations analyzed.

32112 **(N—85-17474) Guidelines for atmospheric measurements in support of electro-optical systems testing.** (Range Commanders Council, White Sands Missile Range, NM (USA)). Oct 1984. 35p. (AD-A—148090). NTIS, PC A03/MF A01.

The recommendations made by eight workshop panels organized to determine specifications for atmospheric measurements are outlined and working sessions are summarized. Measurement guidelines for meteorological parameters, gaseous and aerosol constituents, and transmission parameters are given.

32113 **(DP-MS—76-64) Estimating diffusion coefficients from meteorological data.** Pendergast, M.M. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1976. Contract AC09-76SR00001. 45p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012563.

Meteorological data for four different time series were collected to compare direct and indirect methods for selecting stability categories used to determine coefficients in the calculation of downwind air concentrations from releases of atmospheric contaminants. The data set includes wind velocity and temperature observations between 2 and 335 m from the WJBF-TV Tower near Beech Island, South Carolina, and surface weather observations at Bush Field Airport, Augusta, Georgia. The direct method based on the standard deviations of horizontal and vertical wind direction, σ/sub θ/ and σ/sub phi/, provides the best estimates of the true stability category. Three indirect methods based on the vertical temperature gradient, surface weather observations, and the Richardson number were evaluated with these estimates. 18 refs., 4 figs., 7 tabs.

32114 **(NUREG/CR—4159) Comparison of the 1981 INEL dispersion data with results from a number of different models.** Lewellen, W.S.; Sykes, R.I.; Parker, S.F. (Aeronautical Research Associates of Princeton, Inc., NJ (USA)). May 1985. 200p. (ARAP—505). NTIS, PC A09/MF A01 - GPO. File Number TI85901493.

The results from simulations by 12 different dispersion models are compared with observations from an extensive field experiment conducted by the Nuclear Regulatory Commission at the Idaho National Engineering Laboratory in July, 1981. Comparisons were made on the bases of hourly SF_6 samples taken at the surface, out to approximately 10 km from the 46 m release tower, both during and following 7 different 8-hour releases. Comparisons are also made for total integrated doses collected out to approximately 40 km. Three classes of models are used. Within the limited range appropriate for Class A models this data comparison shows that neither the puff models or the transport and diffusion models agree with the data any better than the simple Gaussian plume models. The puff and transport and diffusion models do show a slight edge in performance in comparison with the total dose over the extended range approximate for class B models. The best model results for the hourly samples show approximately 40% calculated within a factor of two when a 15° uncertainty in plume position is permitted and it is assumed that higher data samples may occur at stations between the actual sample sites. This is increased to 60% for the 12 hour integrated dose and 70% for the total integrated dose when the same performance measure is used. None of the models reproduce the observed patchy dose patterns. This patchiness is consistent with the discussion of the inherent uncertainty associated with time averaged plume observations contained in our companion reports on the scientific critique of available models.

32115 **(UCID—20415) User's guide to the MATHEW/ADPIC models.** Rodriguez, D.J.; Greenly, G.D.; Gresho, P.M.; Lange, R.; Lawver, B.S.; Lawson, L.A.; Walker, H. (Lawrence Livermore National Lab., CA (USA); NUS Corp., Gaithersburg, MD (USA)). Mar 1985. Contract W-7405-ENG-48. 165p. NTIS, PC A08/MF A01; 1; GPO Dep. File Number DE85012952.

This user's guide provides both an operational and theoretical summary of the MATHEW/ADPIC transport and diffusion models and supplemental codes needed to execute these models. These models calculate air concentration and ground deposition on a regional scale (up to 200 km) from continuous or instantaneous point sources. MATHEW is a three-dimensional meteorological data-adjustment model which supplies ADPIC with mean wind fields that are mass-consistent, three-dimensional, and representative of the available meteorological measurements (surface, tower, and upper-air soundings). The bottom boundary in this model is determined by grid cell estimates of the actual topographic features of a given site and its environs, which can play a very important role in defining or modeling regional-scale patterns. ADPIC is a three-dimensional, particle-in-cell transport and diffusion code capable of calculating the time-dependent dispersion of inert or radioactive air pollutants. In addition to MATHEW/ADPIC, three supplemental codes are required to provide input/output support. These codes, which are also discussed in this user's guide, are TOPOG, MEDIC, and PLOTOCONTR.

32116 **(UCRL—15475) Atmospheric boundary layer testing. Final project report.** Brandt, H.; White, B.R.; Burke, J.P. (California Univ., Davis (USA). Dept. of Mechanical Engineering). Jun 1982. Contract W-7405-ENG-48. 145p. NTIS, PC A07/MF A01; 1; GPO Dep. File Number DE85012931.

Low-speed wind-tunnel studies have been conducted that examined mean velocity profiles and longitudinal turbulence quantities including the energy spectra for a zero-pressure-gradient turbulent boundary layer flow over a rough-to-smooth change in surface roughness. The flow examined modeled the lower 30 to 50 m of the urban atmospheric boundary layer. The wind-tunnel flow was developed over a 12 m long flow conditioning section where roughness elements occupied the lower 10 to 13% of a 70 cm thick boundary layer with the freestream velocity of approximately 3.0 m/s. The present results provided unique information concerning the wind tunnel simulation of the urban atmospheric boundary layer in the following areas: (1) the presence and growth of an "inner boundary layer" downstream of a step transition in surface roughness; (2) the enhancement of boundary layer thickness ad turbulence characteristics using vortex generators or spires; and (3) determination of the appropriate modeling length scales. 56 figs., 4 tabs.

32117 **(UCRL—15475-Suppl.2) Atmospheric boundary layer testing: hot-wire anemometry measurements of turbulent boundary layer flow past a two-dimensional obstacle. 1982-1983 equipment loan report. Supplement 2.** White, B.R.; Strataridakis, C.J. (California Univ., Davis (USA). Dept. of Mechanical Engineering). Nov 1984. Contract W-7405-ENG-48. 176p. NTIS, PC A09/MF A01; 1; GPO Dep. File Number DE85012875.

Measurements of a zero-pressure-gradient turbulent boundary layer flow past a two-dimensional obstacle were made in the present study. Measurements were made for both smooth and rough surfaces using single and X hot-wire probes. The Reynolds number based on obstacle height and freestream velocity was about 15,302. Profiles of mean velocity, turbulent intensity and probability density functions in two dimensions were determined. Also, Reynolds stress profiles, energy spectra and second moments of energy spectra were obtained. From the results evidence emerged that upstream, over, and downstream of the obstacle there zones of recirculating flow. The flow-field was dominated by the obstacle presence, such that no distinction between smooth-and rough-surface measurements could be made.

32118 **(UCRL—15662) Evaluation of the 2DFLOW and hybrid complex-terrain dispersion models with the 1980 ASCOT data base from The Geysers. Final report.** Tesche, T.W.; Haney, J.L.; Morris, R.E. (Systems Applications, Inc., San Rafael, CA (USA)). Nov 1984. Contract W-7405-ENG-48. 59p. (ASCOT—84-8). NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85012960.

This study utilized data collected during 5 tracer experiments to test the predictive performance of two numerical, grid-based complex-terrain dispersion models - the 2DFLOW and Hybrid models. The 2DFLOW model was developed by researchers at Savannah River National Laboratory (Garrett and Smith, 1982, 1984); the Hybrid model was developed by Systems Applications, Inc., and has been applied to air quality problems and in model evaluation studies for several years (Tesche, 1983). This study closely parallels a more extensive model evaluation effort at The Geysers in which four models - Mathew, ADPIC, SMOG, Hybrid, and 2DFLOW - were evaluated with additional tracer experiments from the 1981 ASCOT program and from earlier tracer studies conducted between 1878 to 1980 (Tesche, Haney, and Morris, 1984a,b; Tesche, 1984). In Section 2, we provide a brief overview of the theoretical formulation of the 2DFLOW and Hybrid models. Section 3 presents simulation results for each model for the five 1980 ASCOT drainage experiments. We interpret these results in Section 4 and present our findings and conclusions in Section 5.

32119 **(UCRL—92502) Distributed emergency response system to model dispersion and deposition of atmospheric releases.** Taylor, S.S. (Lawrence Livermore National Lab., CA (USA)). Apr 1985. Contract W-7405-ENG-48. 8p. (CONF-8505137—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011847.

From 6. IFAC workshop on distributed computer control systems; Monterey, CA, USA (20 May 1985).

Aging hardware and software and increasing commitments by the Departments of Energy and Defense have led us to develop a new, expanded system to replace the existing Atmospheric Release Advisory Capability (ARAC) system. This distributed, computer-based, emergency response system is used by state and federal agencies to assess the environmental health hazards resulting from an accidental release of radioactive material into the atmosphere. Like its predecessor, the expanded system uses local meteorology (e.g., wind speed and wind direction), as well as terrain information, to simulate the transport and dispersion of the airborne material. The system also calculates deposition and dose and displays them graphically over base maps of the local geography for use by on-site authorities. This paper discusses the limitations of the existing ARAC system. It also discusses the components and functionality of the new system, the technical difficulties encountered and resolved in its design and implementation, and the software methodologies and tools employed in its development.

32120 **Measured atmospheric stability near Oak Ridge; Tennessee.** Sandusky, W.F. (Battelle, Pacific Northwest Labs., Richland, WA). *Journal of the Air Pollution Control Association;* **35**: No. 2, 121-126(Feb 1985).

Atmospheric stability data, as determined by two accepted regulatory methods, were obtained for three distinct levels at a site on the Department of Energy's reservation near Oak Ridge, Tennessee, to support a construction permit for a nuclear facility. Annual, seasonal, and diurnal data sets were compared and found to differ markedly. Comparison of concurrent data sets indicated little correlation of the predicted atmospheric stability class existed. Data were obtained by two methods. A vertical temperature gradient method ($\Delta T/\Delta Z$) indicated neutral atmospheric conditions existed for an elevated layer, while layers near the surface experienced large occurrences of both extremely unstable and stable conditions. This pattern was consistent for each season, except the variation was most pronounced during the summer. On a diurnal basis, data for the layers near the surface experienced the classic variation of stable conditions during the night and unstable conditions during the day. The elevated layer, however, showed a less pronounced variation of atmospheric stability conditions. Data obtained by the other method, the standard deviation of the horizontal wind direction method (σ/sub theta/), indicated primarily unstable atmospheric stability conditions for each measurement level above the surface, although the tendency was toward neutral conditions at elevated levels. Stability conditions varied only slightly for the highest level over the course of the day, whereas the lower level showed the largest variation, especially during the winter season. These differences in estimating the atmospheric stability class for the two methods can be attributed to the fact that one method, σ/ sub theta/, can account for unstable conditions resulting from nocturnal drainage winds that occur at the site. Thus, care must be used in determining atmospheric stability conditions if dispersion calculations are to be made.

32121 **Average diurnal behavior of surface winds during summer at sites in complex terrain.** Garrett, A.J.; Smith, F.G. III. (Savannah River Laboratory, E.I. du Pont de Nemours & Co., Aiken, SC 29808). *Journal of Applied Meteorology;* **24**: No. 2, 174-191(Feb 1985). Contract AC09-76SR00001.

Mean diurnal wind distributions from five surface stations in the rugged Geysers area of northern California were examined to determine how they were affected by the terrain. The one-dimensional slop-flow model of Garrett was abel to simulate the average diurnal wind distribution at the station with the simplest slope geometry and using only routine weather observations as input. Wind direction frequency distributions at the other four stations clearly could not be explained by a simple daytime upslope and nighttime downslope wind distribution. Winds blew perpendicular to canyon axes (simple katabatic and daytime upslope flow) or parallel to canyon axes (organized drainage and upvalley winds), depending on station location. Winds always blew upslope during the day, but at two stations the wind blen some night and downslope on the others. The upslope flow at night may have been caused by prevailing winds in one case, and by drainage winds flowing off an opposing slope and across the intervening riverbed in the other.

32122 **(BNL—35651) Methods for estimating materials in high-rise central business districts.** Lipfert, F.W.; Torpey, M.R. (Brookhaven National Lab., Upton, NY (USA)). Sep 1984. Contract AC02-76CH00016. 33p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012529.

Methods and data bases are reviewed for inventorying quantities of exterior materials in place in high rise central business districts. It is concluded that no computerized data bases exist which provide all the necessary information in one place. Thus it is recommended that computerized office building directories be used to estimate total surface area, and statistical sampling coupled with correlation analysis be attempted to derive relationships for the percentage distribution of susceptible materials to acid rain or other air pollution.

32123 **(BNL—36327) Detailed description and performance of a passive perfluorocarbon tracer system for building ventilation and air exchange measurements.** Dietz, R.N.; Goodrich, R.W.; Cote, E.A.; Wieser, R.F. (Brookhaven National Lab., Upton, NY (USA)). Feb 1985. Contract AC02-76CH00016. 103p. (CONF-8404147—3). NTIS, PC A06/ MF A01; GPO Dep. File Number DE85011826.

From ASTM symposium on measured air leakage performance of buildings; Philadelphia, PA, USA (2 Apr 1984).

The manufacturing procedures and performance of a building air infiltration kit consisting of miniature passive perfluorocarbon tracer (PFT) permeation sources and passive adsorption tube samplers are described. Having four PFT-types available, homes and buildings with up to four separate zones can be fully evaluated under steady state conditions for the air infiltration and exfiltration rates from each zone as well as the air exchange rates between zones using this inexpensive and non-obtrusive field kit. Complete details on deployment in homes and on gas chromatographic analysis of the passive samplers are presented. Examples of total air changes per hour (ACH) results in several studies showed average values between 0.25 to 0.64 h^{-1}. A generalized correlation was used to characterize the leakiness of eleven homes in the US and Canada, showing ACH dependency only on inside-outside temperature difference, wind speed to the 1.5 power, and a subjective terrain factor; the approach has application in evaluating weatherization performance. Details of multizone measurements in four homes provided insight into the role of attics, crawl-spaces, and basements on the indoor air quality and weatherization needs for the living zone. 26 refs., 15 figs., 23 tabs.

32124 (BNL—36333) **Multizone infiltration measurements in homes and buildings determined with a passive perfluorocarbon tracer method.** Dietz, R.N.; D'Ottavio, T.W.; Goodrich, R.W. (Brookhaven National Lab., Upton, NY (USA)). Mar 1985. Contract AC02-76CH00016. 38p. (CONF-850606—5). NTIS, PC A03/MF A01; GPO Dep. File Number DE85011818.

From American Society of Heating, Refrigerating and Air-Conditioning Engineers' semiannual meeting; Honolulu, HI, USA (23 Jun 1985).

A miniature passive perfluorocarbon tracer system was successfully applied to the determination of air infiltration and exfiltration rates from each zone of a multizoned structure as well as the air exchange rates between zones in homes, multiple unit condominiums, naturally ventilated apartment buildings, and large commercial buildings with multiple air handling systems. Use of the multizone technique in indoor air quality assessments and air handling system stratification studies appears to be quite feasible with the availability of this measurement system. 16 refs., 8 figs., 6 tabs.

32125 (BNL—36428) **Systems study for the removal, recovery, and disposal of carbon dioxide from fossil fuel power plants in the US.** Steinberg, M.; Cheng, H.C. (Brookhaven National Lab., Upton, NY (USA)). Feb 1985. Contract AC02-76CH00016. 25p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012274.

The present study is part of the research on prevention options and deals with controlling the CO_2 emission from fossil fuel burning power plants. Data from US fossil fuel fired power plants, which constitute the major point sources of CO_2, are used in this initial systems study of the removal, recovery, and disposal of CO_2 from stack gases. Ths US contributes about 30% of the world's total man-made CO_2 emission. Utilities are responsible for about 30% of the total US emissions. Estimates indicate that a reduction in the annual incremental atmospheric CO_2 content of up to 10% would be achieved by a CO_2 control system applied to US utility plants. 24 refs., 8 tabs., 6 figs.

32126 (CEA-CONF—7384) **DIAL lidar measurements of atmospheric pollutants (SO_2, O_3) during the Fos-Berre 83 experiment.** Capitini, R.; Ancellet, G.; Megie, G.; Pelon, J.; Renaut, D. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). Aug 1984. 6p. (CONF-8408147—1). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751349.

From 12. international laser radar conference; Aix-en-Provence, France (13 Aug 1984).

Two UV DIAL lidars have been designed by French organisms (CEA, CNRS, EERM) to measure the concentration and the spatial distribution of atmospheric pollutants. As a large area can be probed with these instruments, they have been used for the remote range-resolved monitoring of SO_2 and O_3 during the 6th European Pollution Campaign. SO_2 and O_3 profiles and vertical sections were performed in the atmosphere polluted by the waste products released by the refineries, more especially in stable meteorological conditions with a weak wind aloft. For SO_2 in a range of 3 km a spatial resolution of 300 to 500 m and a time resolution of 3 to 5 mn are obtained. For O_3 in a range of 2.5 km a spatial resolution of 150 to 500 m and a time resolution of 3 to 15 mn are obtained. In both cases statistical error is below 20 ppb. Measurements are validated and compared to other DIAL lidars.

32127 (DOE/CE—0091/1) **Indoor air pollution.** (Conservation and Renewable Energy Inquiry and Referral Service, Silver Spring, MD (USA)). May 1985. Contract AC01-83CE30780. 3p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013097.

FS 185, 2nd edition.

This factsheet reviews what is currently known about pollutant sources, abatement and control equipment and techniques for poorly ventilated houses. Radon, formaldehyde, tobacco smokes, carbon dioxide, carbon monoxide, particulates, bacteria, fungi and viruses are addressed. (PSB)

32128 (DOE/ER/10231—T1, pp 109-117) **International problems: ramifications of the carbon dioxide fossil fuel issue.** Cooper, C.L. (Institute for Energy Analysis, Oak Ridge, TN). 1984. NTIS, PC A07/MF A01. File Number DE85004706.

In Focus: energy issues for the eighties.

The carbon dioxide (CO_2) may be second only to nuclear war as the most challenging issue of the times. The use of fossil fuels and changing land use patterns have caused the problem, but the connection of CO_2 to the greenhouse effect has only recently caused concern over possible climatic effects from the doubling of concentration that will occur in the 21st century. A major uncertainty is the dynamics of international cooperation. The solution of the problem will involve global decisions, although actions by the major energy-consuming countries will be the deciding factor. Scientists are still uncertain about how 2-3°C changes in temperature will affect precipitation and agriculture. 3 figures, 1 table.

32129 (DOE/ER/10231—T1, pp 119-141) **Global carbon geosystem.** Dahlman, R. (Dept. of Energy, Washington, DC). 1984. NTIS, PC A07/MF A01. File Number DE85004706.

In Focus: energy issues for the eighties.

An overview of the global carbon dioxide (CO_2) problem discusses the carbon systems and carbon cycle and the possible impacts of massive geophysical changes from the release of a large quantity of CO_2 through the burning of fossil fuels. The author reviews current knowledge, DOE research programs, and a model for mitigating atmospheric CO_2 effects on climate and vegetation. Possible options for mitigation involve learning more about the role of the oceans and vegetation in maintaining a balance in the carbon cycle. 15 figures.

32130 (DOE/ER/60081—T2) **Climate modeling: a retrospective-prospective view with consideration for the atmospheric carbon dioxide-climate issue.** Sandahl, C.A.; Shieh, S.J. (InterAmerica Research Associates, Inc., Rosslyn, VA). 29 Jun 1984. Contract AC01-82ER60081. 121p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE85011532.

This paper provides a retrospective-prospective view of scientific and technological developments that led to our present capability to predict climate, with particular emphasis on the potential impact of increased atmospheric carbon dioxide, through the use of computer models of the earth-atmosphere system. This view is illustrated by means of a "technology tree" that traces out the history of key developments. The trunk of the tree represents present competence; the limbs and branches represent antecedent work and interrelationships therein. The technology tree provides a perspective of overall progress, shows where events have come together to provide substantial advancements, exposes areas where progress may be slower than desired, and indicates profitable directions for future work. 14 figs., 7 tabs.

32131 (DOE/ER/60106—2) **Lake ice occurrence as a possible detector of atmospheric CO_2 effects on climate. Second annual progress report, 1 December 1983-31 May 1985.** Barry, R.G. (Colorado Univ., Boulder (USA). Cooperative Inst. for Research in Environmental Sciences). May 1985. Contract AC02-83ER60106. 54p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85012987.

A study has been made of the temporal and spatial patterns of the freeze-up and break-up of lakes in the sub-arctic and middle latitudes of the northern hemisphere, in an attempt to identify the potential effects of warming due to CO_2 and other greenhouse effects. Historical records of lake freeze-up/break-up dates and daily temperature at "neighbouring" meteorological/climatological stations have been analyzed in order to determine the degree of variance in the lake ice event dates that can be accounted for by simple temperature indices. Lake ice is a prime candidate for "first effects detection" of CO_2-induced warming because: (1) it shows a high degree of sensitivity to a single meteorological variable (temperature); (2) it has a short response time to temperature anomalies; (3) a single (in most cases), readily identifiable event (i.e., freeze-up/break-up) is the response to some integral of seasonal temperature conditions; (4) historical records are available to establish lake ice-temperature relationships; (5) freeze-up/break-up of lakes is recorded at a wide network of sites and, in addition, it can be readily monitored by operational satellite data.

32132 **(DOE/EV/02986—T1) Throughfall rate and chemistry studies: Whiteface Mountain.** Kadlecek, J.A.; Mossl, B. (State Univ. of New York, Albany (USA). Atmospheric Sciences Research Center). [1985]. Contract AC02-76EV02986. 30p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012407.

Ranges of site dependent variability in precipitation quantity and chemical composition were studied with the following recommendations. At the 2000 ft level, the distribution of collected volumes is event dependent and normalization by open collection does not help. Averages based on approximately 5 to 10,000 cm^2 collection area should give results commensurate with uncertainties normally found in precipitation sampling. Troughs and buckets of equivalent areas give similar results. Wet precipitation is the primary mechanism for dominant inorganic ion deposition. However, near summit level, additional collection area will be required to reduce the sampling uncertainties. Throughfall deposition was enriched in this study, relative to rain, by a factor of about 6 for SO_4^{2-} and 4 for H^+. The uncertainty in these values is large, but enrichment does occur. The authors postulate that cloud capture is the primary source. (PSB)

32133 **(DOE/EV/10610—4) Model projections of time-dependent response to increasing carbon dioxide. Final report.** Hoffert, M.I.; Flannery, B.P. (New York Univ., NY (USA). Dept. of Applied Science). May 1985. Contract AC02-81EV10610. 63p. (NYU/DAS—85-137). NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85013326.

The state-of-the-art of mathematical models of transient climate change from historical and projected increases in atmospheric carbon dioxide and related factors is reviewed, including studies done at NYU and elsewhere. Major conclusions are: (1) the transient climate changes over 10 to 100 year timescales are probably driven by several "external" factors acting simultaneously, as well as "internal" factors such as variations in ocean dynamics; (2) the response of global temperature to this forcing is not instantaneous, but is delayed by times of the order 10 to 100 years by thermal damping by the upper ocean; (3) the development of reliable models is hampered by lack of a clear validation strategy for testing models against observations; (4) when run with standard scenarios, current models predict a global warming of the order of 1°C by the year 2000 relative to 1850, with an additional 2 to 5°C over the next century; However, the sensitivity of these predictions to uncertainties has not been sufficiently explored. Specific research programs are recommended to improve our ability to predict transient climatic changes from continued fossil fuel burning.

32134 **(DOE/NBB—0070) Two dimensional CO_2-ocean model including the biological processes.** Baes, C.F. Jr.; Killough, G.G. (Oak Ridge National Lab., TN (USA)). May 1985. Contract AC05-84OR21400. 38p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012341.

A two-dimensional (latitude X depth) multi-box model of the ocean has been developed and used to predict the distribution of carbon dioxide between the ocean and the atmosphere. The model simulates the chemical and biological processes in the ocean that affect this distribution (i.e., ocean-atmosphere exchange of CO_2, photosynthesis and decay, calcium carbonate production and dissolution) by means of linear functions. The boxes are arranged to simulate isothermal regions in an idealized world ocean and the numerous flows are adjusted by means of three diffusivity parameters. In steady-state calculations, the concentrations of the various forms of carbon, dissolved oxygen, nutrient, alkalinity, and ^{14}C in each box are determined by matrix methods with three boundary conditions specified, namely, the partial pressure of CO_2 in the atmosphere and the nutrient concentration and alkalinity in one box. If the concentration of nutrients is doubled, P/sub a/ is nearly halved. Halving the rate of circulation lowers P/sub a/ by about 10%. Warming of the ocean increases P/sub a/ by about the amount expected (4%/°C) from the temperature coefficient of P/sub a/ when total dissolved carbon and alkalinity are held constant. Time integrations of the model beginning from a steady-state condition at various times in the last century show that for carbon uptakes (X_0) of less than about 100 Gt(Pg), the rate of uptake (in Gt/y) is approximated by $dX_0/dt = 0.0287$ (X/sub a/ - X_0), where X/sub a/ is the excess carbon in the atmosphere, and is otherwise almost independent of the scenario assumed for the variation of P/sub a/ with time. As X_0 increases further, the rate of uptake shows increasing negative deviations from this correlation. 36 refs., 10 figs., 11 tabs.

32135 **(DOE/OR/21400—T123) Effects of acid rain on forest nutrient status. Final report.** Johnson, D.W.; Cole, D.W. (Oak Ridge National Lab., TN (USA)). Apr 1985. Contract AC05-84OR21400. 45p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012486.

In five forest sites (three in eastern Tennessee and two in western Washington) the effect of natural carbonic acid production on soil leaching was equaled or exceeded by that of atmospheric acid inputs. In a nitrogen-fixing red alder site in Washington, however, internal leaching by nitrification and nitric acid formation far exceeded atmospheric H^+ inputs at any site. All other sites retained NO_3^-, and soil SO_4^{2-} adsorption reduced the effectiveness of atmospheric H_2SO_4 inputs on soil leaching in two of the Tennessee sites and in the Washington red alder site. Atmospheric sulfur inputs exceeded the forest sulfur requirement in all five sites. Decomposer invertebrates appeared to be affected negatively by unrealistically large applications of SO_4^{2-}, either as $KHSO_4$ or K_2SO_4. Forest floor buffering prevented large changes in pH with acid SO_4^{2-} treatments. Results indicate that effects of acid deposition on decomposer invertebrates are unlikely except at input levels much higher than ambient.

32136 **(DOE/PC/71253—2) Elemental tracers of source regions of contaminants in precipitation. Second quarterly report.** Rahn, K.A.; Heaton, R. (Rhode Island Univ., Narragansett (USA). Graduate School of Oceanography). 1 Jun 1985. Contract FG22-84PC71253. 11p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012858.

To date, we have sampled eight precipitation events, each with daily aerosol samples before, during, and after. Analytical data are complete for the first five events, and are presented. Improvements in sampling and analytical blanks are reported as well as analytical procedure.

32137 **(GSF-BPT—6/84) Improved knowledge on the climatology of the vertical ozone layer by means of balloon-borne ozone soundings.** Attmannspacher, W.; Hartmannsgruber, R.; Lang, P. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.). Bereich Projekttraegerschaften). Jun 1984. 46p. (In German). NTIS (US Sales Only), PC A03/MF A01. File Number DE85752001.

The behaviour of ozone through the year and the deviations from these data were measured by means of ozone soundings. Stratospheric ozone concentrations were found to be lower than the long-period means. In contrast, increasing ozone values were measured in the troposphere, although these did not compensate the stratospheric decrease.

32138 **(GSF-BPT—9/84) Influence of the biosphere on the release of N_2O from mineral nitrogenous fertilizers.** Conrad, R.; Seiler, W. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.). Bereich Projekttraegerschaften). Jun 1984. 59p. (In German). NTIS (US Sales Only), PC A04/MF A01. File Number DE85752004.

Within a test station near Mainz and in sites in Andalusia, measuring devices were installed in defined areas and put into operation only half a year later. Thus similar rates of NO_2 emission between the individual areas of measurement were obtained. The kind of fertilizer was seen to have a marked influence on the quantity of the NO_2 emission. The influence of the quantity of fertilizer used and its form of application is due to local concentrations of nitrogen and thus to the microbial decomposition of nitrogen. Precipitations and daily variance are also of consequence.

32139 **(Juel-Spez—279) Methods of the ecotoxicological evaluation of chemicals. Photochemical degradation in the gas phase. Vol. 6.** Becker, K.H.; Biehl, H.M.; Bruckmann, P.; Fink, E.H.; Fuehr, F.; Kloepffer, W.; Zellner, R.; Zetzsch, C. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Projekttraeger fuer Umweltchemikalien). Nov 1984. 124p. NTIS (US Sales Only), PC A06/MF A01. File Number DE85752002.

Chemical degradation in the atmosphere is a result of direct and indirect photochemical reactions. It is now a well established fact that, among the homogenous gas phase processes, reactions initiated by the hydroxyl (OH) radical provide the most important degradation routes. This is based on the OH reactivity, as expressed by the rate coefficient ksub(OH), and the atmospheric OH concentration level. The present work contains the results of a comprehensive determination of the OH reactivity performed in different laboratories in Germany. The present report begins with a detailed description of the different experimental techniques applied within this project; in the following the results obtained from both, absolute and relative techniques are summarized in tabular form. Moreover, the use of laboratory kinetic data in order to estimate lifetimes of chemicals in the atmospheric environment and problems associated with this procedure will be discussed in the last section.

32140 **(N—85-16319) NOx emissions near a heat pump with gas motor.** Hendriks, T.P.M.; Visser, J.C. (British Gas Corp., London). Jul 1984. 27p. (BLL-WH—782-(9091.9F); T—6357/BG/WH782/84). British Library Lending Div., Boston Spa, England.

The area near the installation building of a heat pump driven by a gas motor was studied to determine whether concentrations of combustion gases occur which may have long term harmful effects on public health. In addition, the extent to which the dilution of combustion gases a very short distance from the building can be described by means of currently known air pollution transport models was investigated. At no single measurement point around the heat pump building did nitrogen oxide emission concentrations exceed 25 ppb, the 50-percentile value in the health standards for outside air.

32141 **(N—85-16324) CSIRO (Australia) atmospheric carbon dioxide monitoring program: surface data.** Beardsmore, D.J.; Pearman, G.I.; Obrien, C. (Commonwealth Scientific and Industrial Research Organization, Mordialoc (Australia). Div. of Atmospheric Physics). 1984. 120p. NTIS, PC A06/MF A01.

The Commonwealth Scientific and Industrial Research Organization (CSIRO) surface carbon dioxide monitoring programs at the Australian BAPMoN station at Cape Grim in Tasmania, the subAntarctic station at Macquarie Island, Mawson on the Antarctic mainland, Wilbinga in Western Australia, and from ships in the Southern Ocean are described. Background composition of the atmosphere was studied. The techniques and data handling procedures for the surface observation program, summary data, and the complete archived data sets are described. It is concluded that the present concept is a satisfactory basis on which to provide data for use in the global carbon cycle context.

32142 **(PB—85-153906/XAB) Review of national emission standards for mercury.** (Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards). Dec 1984. 72p. (EPA—450/3-84/014). NTIS, PC A04/MF A01.

This report presents the findings of the 5-year review of the national emission standards for mercury. Industries subject to the existing standard are mercury-cell chlor-alkali plants, sludge drying and incineration plants, and mercury-ore-processing facilities. Information and estimates are presented concerning processes, mercury emissions, control technology, compliance status, and industry growth. Information is presented about other industry source categories which have mercury air emissions, but are not regulated by the standards.

32143 **(PB—85-155943/XAB) Development of a model to estimate dispersion of elevated releases in the shear-dominated boundary layer. Final report.** Venkatram, A.; Paine, R. (Environmental Research and Technology, Inc., Concord, MA (USA)). May 1984. 105p. NTIS, PC A06/MF A01.

Pollutant emissions from tall stacks can give rise to high ground-level concentrations during what are commonly characterized as neutral conditions. This report describes a new model to estimate dispersion under high wind conditions. The model incorporates our latest understanding of the structure of the shear-dominated stable boundary layer. Vertical inhomogeneity is treated with two different sigma-z values corresponding to the upper and lower parts of the plume. The model has been evaluated against observations of ground-level concentrations measured at monitors in the vicinity of two power plants in the Midwest. Model testing inddicates that the model represents a significant improvement over currently available models.

32144 **(PB—85-157378/XAB) Computer-controlled acquisition of corrosion-rate data from multiple sensors.** Kendig, M.; Jeanjaquet, S.; Mansfeld, F. (Rockwell International Corp., Thousand Oaks, CA (USA). Science Center). Jan 1985. 19p. NTIS, PC A02/MF A01.

Determination of the polarization resistance from multiple sensors under computer control provides rapid, reproducible, and accurate means for determining corrosion rates ranging over many orders of magnitude for large test matrices. Computerized techniques can simultaneously evaluate the response of many sensors to variations in the composition of a corrosive environment. Examples are presented of computerized corrosion monitoring of atmospheric corrosion rate monitors subjected to pollutant transients, and of materials in simulated flue-gas desulfurization media containing trace elements.

32145 **(PB—85-157386/XAB) Emission inventory applications to Regional Acid-Deposition Modeling.** Novak, J.H. (Environmental Protection Agency, Research Triangle Park, NC (USA). Environmental Sciences Research Lab.). Jan 1985. 7p. (EPA—600/D-85/017). NTIS, PC A02/MF A01.

A comprehensive Regional Acid Deposition Model (RADM) is being developed and a simpler fast-turn-around engineering model(s) (EM) is being designed by the National Center for Atmospheric Research as part of the National Acid Precipitation Assessment Program (NAPAP). This paper describes how potential assessment applications and research questions affect those model designs and the subsequent emission inventory requirements. Finally, a recommendation is made for EPA to consolidate inventory development efforts to produce an agency emission inventory applicable to the wide spectrum of models and applications throughout EPA.

32146 **(PB—85-169605/XAB) Overview of EPA's (Environmental Protection Agency's) LIMB technology development program.** Lachapelle, D.G. (Environmental Protection Agency, Research Triangle Park, NC (USA). Air and Energy Engineering Research Lab.). Feb 1985. 31p. (EPA—600/D-85/042). NTIS, PC A03/MF A01.

The paper gives an overview of EPA's Limestone Injection with Multistage Burners (LIMB) program, a program for research, development, and demonstration of cost-effective emissions control technology for coal-fired boilers that can reduce both sulfur oxides (SOx) and nitrogen oxides (NOx). The LIMB concept uses low-NOx burners plus sorbent injection to control these pollutants simultaneously. LIMB technology represents a lower-cost alternative to currently available SOx control approaches such as flue-gas desulfurization, coal cleaning, and coal switching. LIMB technology is especially attractive where coal-fired boilers must be retrofitted to minimize emissions of NOx and SOx, which are major acid-rain precursors. This is due to LIMB's relative ease of retrofit to both small and large coal-fired boilers and its lower cost. LIMB performance goals are: (for retrofit) to achieve a 50-60% reduction of both SOx and NOx from uncontrolled levels; and (for new units) to achieve a 70-80% reduction of NOx and a 70-90% reduction of SOx from uncontrolled levels.

32147 (PB—85-172336/XAB) National Dioxin Study Tier 4 - combustion sources: project plan. Final report. Lillis, E.; Miles, A. (Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards; Radian Corp., Research Triangle Park, NC (USA)). Feb 1985. 75p. (EPA/450/4—84/014A). NTIS, PC A04/MF A01.

Prepared in cooperation with Radian Corp., Research Triangle Park, NC; See also PB85-172344.

This report presents the Agency's plans for identifying likely sources and assessing dioxin emissions from combustion sources under Tier 4 of the National Dioxin Study. The primary objectives of Tier 4 are outlined in the report. These are to determine what source categories emit dioxin, at what concentrations and at what estimated exposure risk. The report describes the rationale used in developing the project plan, as well as alternative approaches that were considered. The report describes the information the Agency plans to collect to improve the current understanding of combustion sources which emit dioxin to the ambient air. The tasks to collect the information are outlined, including stack testing, ash sampling, and data analysis. References to other documents which describe methods and procedures are identified.

32148 (UCRL—15475-Suppl.1) Atmospheric boundary layer testing: experimental measurements of heavier-than-air gas dispersion in an atmospheric boundary layer. 1982-1983 Equipment loan report. Supplement 1. White, B.R.; Joske, M. (California Univ., Davis (USA). Dept. of Mechanical Engineering). Nov 1983. Contract W-7405-ENG-48. 69p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85012876.

A uniform two-dimensional carbon dioxide gas dispersion in air over a two-dimensional square obstacle was studied experimentally in an atmospheric wind tunnel. The obstacle Reynolds number was about 6000 based upon the undisturbed velocity at the height of the obstacle, and the Froude number was about 1.75. The carbon dioxide was injected vertically upward from the surface at a rate of 10 percent of the freestream velocity. The injection surface area began one obstacle length upstream and extended upstream about 1 1/2 obstacle lengths. A gas concentration measurement system for carbon dioxide mixtures and air was developed for use in an atmospheric wind tunnel. Centerline steady-state concentration profiles were measured for various locations upstream and downstream of the obstacle. The experimental results were compared with the numerical solutions of Sutton (1982). The experiment measurements of concentration were lower than the predicted results of Sutton's numerical solutions, which may be attributed to the higher value of the Froude number in the experimental measurements.

32149 (UCRL—91402) Evaluation of source strength and dispersion model predictions with data from large nitrogen tetroxide field experiments. McRae, T.G. (Lawrence Livermore National Lab., CA (USA)). Apr 1985. Contract W-7405-ENG-48. 23p. (CONF-8504135—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011855.

From 15. international technical meeting on air pollution modeling and it's application; St. Louis, MO, USA (15 Apr 1985).

A series of large scale nitrogen tetroxide spill tests were conducted to determine the source strength characteristics and heavy-gas dispersion aspects of large N_2O_4 spills. The source strength and downwind dispersion results of two of the spills were used to evaluate several source strength and Gaussian dispersion models. It was concluded that: the internal energy heat source is a major contributor to the source strength; that source strength models need improvement; that formation of a dense HNO_3 mist may account for much of the downwind mass transport of large N_2O_4 spills and that all models evaluated underpredict downwind gas concentrations. 34 refs., 4 figs., 7 tabs.

32150 Photosynthetic response of Bragg soybean leaves adapted to different CO_2 environments. Valle, R.; Mishoe, J.W.; Campbell, W.J.; Jones, J.W.; Allen, L.H. Jr. (Univ. of Florida, Gainesville). *Crop Science;* **25**: No. 2, 333-339(Mar-Apr 1985). Contract AI01-81ER60001.

Carbon dioxide exchange rate (CER) were measured during seed fill on leaflets of soybean [Glycine max (L.) Merr. Bragg] plants grown at 330 and 660 μmol mol^{-1} CO_2 environments in outdoor growth chambers to investigate their photosynthetic response to light. During midday periods at the R5 growth stage, the plants were submitted to short-term CO_2 levels ranging from 90 to 990 μmol mol^{-1} to determine differences in leaf photosynthetic response caused by CO_2 acclimation. The data were fitted to a rectangular hyperbola of the Michaelis-Menten form in which the independent variable was radiation or CO_2. Light and CO_2 compensation points were calculated from the parameters of the model. Light response curves showed that leaflets grown and measured at 660 μmol mol^{-1} CO_2 had higher CER asymptotes, higher apparent Michaelis-Menten constants for light, higher apparent quantum yield, and lower light compensation points than leaflets adapted to and measured at 330 μmol mol^{-1} CO_2. The CER-CO_2 curve parameters also indicated higher asymptotic ceilings of CER at high CO_2 for the higher CO_2 adapted leaflets. The CO_2 compensation point was significantly lower in leaflets adapted to high CO_2 levels than those adapted to ambient CO_2, indicating a decrease in photorespiration. It was concluded that during seed fill, leaflets adapted to high CO_2 environments exhibited a capability to utilize CO_2 and radiation more efficiently at elevated CO_2 and throughout all light levels than leaflets grown at low CO_2.

32151 Design and operation of a batch-feed fluidizing bed aerosol generator for inhalation toxicity studies. Shiotsuka, R.N.; Peck, R.W. Jr.; Drew, R.T. (Brookhaven National Lab., Upton, NY). *American Industrial Hygiene Association Journal;* **46**: No. 2, 80-84(Feb 1985). (CONF-8505143—). Contract AC02-76CH00016.

From American Industrial Hygiene conference; Las Vegas, NV, USA (19 May 1985).

A fluidizing bed aerosol generator (FBG), designed for inhalation toxicity studies, was constructed and tested. A key design feature contributing to its operational stability was the partial masking of the screen supporting the bronze beads. This caused 20-80% of the bed to fluidize under normal operating conditions. The non-fluidizing areas functioned as reservoirs to feed the fluidizing areas. Using a bed volume of 1000 cc of bronze beads and 20 g of MnO_2 dust, the mass output rate ranged from 0.1 to 1.0 mg/min when operated at plenum pressures of 1.04×10^2 to 2.42×10^2 kPa (minimum fluidization pressure was approximately 82.8 kPa). During daily operation at three different output rates, the FBG produced aerosols with little change in particle size distributions or concentration when operated six hours/day for five days. Furthermore, when the FBG was operated at a fixed output rate for 15 days with two recharges of MnO_2 dust, the particle size distribution did not show any cumulative increase. Thus, long-term operation of this FBG should result in a reproducible range of concentration and particle size distribution.

32152 Comment on local source impacts at Hubbard Brook, New Hampshire. Lipfert, F.W.; Dupuis, L.R. (Brookhaven National Lab., Upton, NY). *Journal of the Air Pollution Control Association;* **35**: No. 2, 127-129(Feb 1985).

Information was presented that implied the Hubbard Brook Ecosystem Study precipitation chemistry data base may have been compromised by the presence of a small paper-making facility some 10 km to the north at Lincoln, New Hampshire. The plant operated on coal until 1969, intermittently until 1972, and then converted to oil in 1975. The article by Coffey stated the impact (of the plant) upon the site would tend to mask the effects of regional sulfur dioxide reductions. This note examines this charge. This author computed SO_2 concentration from ground level and elevated, stack level. It was concluded that this data indicated that any influences of local pollution sources on the Hubbard Brook precipitation chemistry are quite minimal, as indicated by both theoretical analysis of the source characteristics and statistical analysis of the precipitation chemistry record per se. Although there are substantial year to year variations, a large portion of the sulfate variance is explained by variations in seasonality and precipitation. The balance is due to meteorological variability and emission variations, but there is no firm statistical evidence as to which source or group of sources is influencing Hubbard Brook precipitation chemistry. This inquiry, in response to Coffey's allegation, has shown the necessity for understanding local source effects on precipitation chemistry as a prerequisite to full understanding and interpretation of monitoring data. 13 references, 1 table.

32153 **Statistical design controversy.** Evans, L.S.; Hendrey, G.R.; Thompson, K.H. (Brookhaven National Lab., Upton, NY). *Journal of the Air Pollution Control Association;* **35**: No. 2, 99-101(Feb 1985).

This article was in response to criticisms received by Evans, Hendrey, and Thompson that their article was biased because of omissions and misrepresentations. The authors contend that experimental designs having only one plot per treatment "were, from the outset, not capable of differentiating between treatment effects and field-position effects," remains valid and is supported by decades of agronomic research. Several men, Irving, Troiano, and McCune thought of the article as a review of all studies of acidic rain effects on soybeans. It was not. The article was written over the concern of the comparisons which were being made among studies which purport to evaluate effects of acid deposition on field-grown crops, and implicitly assumes that all of the studies are of equal scientific value. They are not. Only experimental approaches that are well-focused and designed with appropriate agronomic and statistical procedures should be used for credible regional and national assessments of crop inventories. 12 references.

32154 **Comparison of statistical designs and experimental protocols used to evaluate rain acidity effects on field-grown soybeans.** Evans, L.S.; Hendrey, G.R.; Thompson, K.H. (Brookhaven National Lab., Upton, NY). *Journal of the Air Pollution Control Association;* **34**: No. 11, 1107-1114(Nov 1984). Contract AC02-76CH00016.

Published results of four field experiments testing effects of acidic precipitation in field-grown soybeans have led to contradictory conclusions. This paper examines the experimental procedures and protocols of the four experiments which could have contributed to differences in both the reported crop yields and the interpretations or conclusions drawn from the experiments. The most important difference among the experiments is in their statistical designs. Two of the field layouts used only one plot per treatment, providing replication only for plants, rows or sectors within plots, but not among plots. By using real data from a highly replicated experiment it is shown that with such deficient statistical designs treatment effects cannot be separated from other microenvironmental variables peculiar to a specific plot location. The other two experiments were highly replicated. They were designed to detect differences of approximately 10% among treatment means. Type 1 error, α, was predetermined, and replication was sufficient to keep type 2 error low. This design was made possible because a preliminary experiment was available to estimate the expected components of variance. Despite differences in the procedures and protocols among the four experiments, it is primarily the quality of the experimental design which has determined their validity and relative utility for crop loss assessment. 26 references.

32155 **Commentary.** Irving, P.M. (Argonne National Lab., IL). *Journal of the Air Pollution Control Association;* **34**: No. 11, 1114-1115(Nov 1984).

Patricia Irving is defending the data that they collected concerning the effects acid rain has on soybeans. The paper by Evans et al. focused mainly on the shortcomings in other researchers' experiments, and concluded that their work was only credible. Experiment 2 which Irving conducted (in a dose-response function) was not designed for the results to be extrapolated for use beyond the limits of their experimental design. The results of Evans et al. concerning high concentrations of heavy metals which they used in Experiment 3 and 4 do not reflect those found in the rain of the rural area where soybeans were grown. Evans, while criticizing the statistical work of Irving, asserted that their errors may lead to an erroneous assertion that differences exist. However, Irving concluded that simulated acidic rain resulted in no significant yield differences in Wells soybeans compared to yields in plots exposed to nonacidic rain. Plot-to-plot variance in the Irving experiments was determined through the use of ambient rain comparison plots which were associated with each of the treated plots and was approximately 1% in 1978. Yield differences among Irving's treated plots were less than 4% for each of the two years in which the experiment was performed. The 4% difference among the treated plots is well below the 10% difference that the experiments by Evans et al. were designed to detect. Irving concluded that their work was a valuable contribution to the body of knowledge that existed six years ago regarding acid rain impacts to soybeans. Irving's current well-designed dose-response investigations will be preferable for crop assessments compared to earlier pioneering studies. 6 references, 1 table.

32156 **Climate and climate impact scenarios for Europe in a warmer world.** Lough, J.M.; Wigley, T.M.L.; Palutikof, J.P. (Univ. of East Anglia, Norwich, England). *Journal of Climate and Applied Meteorology;* **22**: 1673-1684(Oct 1983). Contract AC02-79EV10098.

Scenarios for Europe in a warmer world, such as may result from increased atmospheric carbon dioxide levels, have been constructed using the early 20th century warming as an analogue. The climate scenarios are used to construct scenarios of the impact of a global warming on energy consumption and agriculture. Cool winters alone would imply greater energy demand for space heating, but this is largely offset by warmer temperatures in spring and autumn which reduce the length of the heating season. Increased temperature variability combined with a general cooling during winter over north and northwestern Europe suggests a greater frequency of severe winters, and thus larger fluctuations in the demand for heating energy. The impact on agriculture is difficult to assess because of the complexity of crop-climate relationships and because of the importance of nonclimatic factors associated with technological change and perhaps, with enhanced photosynthesis due to increased carbon dioxide concentrations. In northern latitudes, the increase in the length of the growing season would appear to be favorable for agriculture, but warmer summers, drier springs and wetter autumns would be less favorable. A specific study was made of the effect of two different climate scenarios on crop yields in England and Wales with regression models constructed using a principal components regression technique. Most crops showed a decrease in yield for both warm-world scenarios, with largest decreases for hay yield and least effect on wheat yield. A similar regression analysis of French wine-quality showed an improvement in the quality of Bordeaux and Champagne in a warmer world. 52 references, 5 figures, 2 tables.

5003 Radioactive Materials Monitoring And Transport

32157 **(EML—440) Annual report of the Surface Air Sampling Program.** Feely, H.W.; Larsen, R.; Sanderson, C. (USDOE Environmental Measurements Lab., New York). Mar 1985. 85p. NTIS, PC A05. File Number DE85012570.

Measurements of the concentrations of atmospheric radionuclides in filter samples collected for the Environmental Measurements Laboratory's Surface Air Sampling Program indicate that the tropospheric concentrations of radioactive debris from nuclear weapons tests continued to decrease during 1981 to 1983. A springtime peak in the concentrations of fission products was still discernible in the Northern Hemisphere during 1983, but in both hemispheres the concentrations were approaching the lower limits of detection of the analytical techniques that we use to measure them. During 1970 to 1981 we had included sites at the Rocky Flats Plant, Colorado within our sampling program. We were especially interested in monitoring atmospheric concentrations of plutonium that had contaminated some soil there during the 1960's. We ceased sampling at Rocky Flats in 1981 because we believed that our measurements were biased toward high levels by the location of our samplers, and no longer reflected the true levels of atmospheric contamination at the plant. During recent years, the decreasing atmospheric concentrations of debris from nuclear weapons tests have limited the accuracy and precision of the data that we report for such debris. 3 refs., 17 tabs.

32158 (JAERI-M—83-233) **Numerical simulation(I) of field tracer experiment by a system for prediction of environmental emergency dose information (SPEEDI). Field experiment with a line source.** Chino, Masamichi; Ishikawa, Hirohiko; Kakuta, Michio. (Japan Atomic Energy Research Inst., Tokyo). Jan 1984. 64p. (In Japanese). NTIS (US Sales Only), PC A04/MF A01. File Number DE85701057.

In the study about the health protection against accidental release, the development of a code-system SPEEDI and a series of field tracer experiments for the validation of calculation model in SPEEDI have been performed since 1980. This report describes about numerical simulations of field tracer experiments with a line source in 1980 and 1981 whose aim is to study the vertical diffusion in a thermally induced boundary layer (TIBL). To the simulation, WIND04/PRWDA, which are detail calculation codes in SPEEDI, were used, considering the speciality of TIBL structure and release mode of gas tracer. WIND04 calculates three-dimensional mass-consistent wind field by a variational method, and PRWDA calculates three-dimensional concentration distribution by a particle diffusion method, combined with WIND04. Calculated results show that WIND04/PRWDA can simulate complex diffusion, like that the wind distribution changes with time and that the thermally induced boundary layer exists.

32159 (JAERI-M—84-006) **Computer code for calculating a γ-external dose from a randomly distributed radioactive cloud.** Kai, Michiaki. (Japan Atomic Energy Research Inst., Tokyo). Feb 1984. 32p. (In Japanese). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701058.

A computer code (CIDE) has been developed to calculate a γ-external dose from a randomly distributed radioactive cloud. Atmospheric dispersion of radioactive materials accidentally released from a nuclear reactor needs to be estimated considering time-dependent meteorological data and terrain heights. Particle-in-Cell model is useful for that purpose, but it is not easy to calculate the dose from the randomly distributed concentration by numerical integration. In this study the mean concentration in a cell evaluated by PIC model was assumed to be uniformly distributed over that cell, which was integrated as a constant concentration by a point kernel method. The dose was obtained by summing the attributable cell doses. When the concentration of plume had a Gaussian distribution, the results of CIDE code well agreed with those of GAMPLE, which was the code for calculating the dose from the Gaussian distribution. The choice of cell sizes affecting the accuracy of the calculated results was discussed.

32160 (KFK—3866) **Radon measurements in mines and dwellings.** Urban, M.; Binns, D.A.C.; Estrada, J.J. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Sicherheit). Jan 1985. 73p. (CNEN—1101). NTIS (US Sales Only), PC A03/MF A01. File Number DE85751622.

Radon measurements using a time integrating passive radon dosemeter (MAKROFOL track etch detector) have been performed in Brazilian and German mines and dwellings. The present state of the measurement technique is summarized. The results are presented together with exposure calculations and dose estimations for occupational exposure in open pit and underground mines and for the general public in houses.

32161 (MLM—3254) **Outdoor radon monitoring at Canonsburg, Pennsylvania, 1980-1983.** Rudy, C.R.; Jenkins, P.H.; Hagee, G.R.; Miles, J.C.; Yates, W.G. (Monsanto Research Corp., Miamisburg, OH (USA). Mound). 31 May 1985. Contract AC04-76DP00053. 41p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85013320.

This report summarizes the results of radon measurements from January 1980 to July 1983 near the former Vitro Manufacturing Plant located in Canonsburg, Pennsylvania. During this period, radon monitoring was performed on a continuous basis at 40 to 50 monitoring locations surrounding the site. Weekly measurements were made using Passive Environmental Radon Monitors (PERMs) at these locations. In addition, meteorological measurements were made at the same time using a weather station located at the site. The results indicate that increased radon concentrations occur downwind of the site. The maximum off-site concentration measured was 0.93 pCi/L (39-month average). The maximum on-site concentration measured was 3.0 pCi/L (11-month average). Background outdoor radon concentrations ranged from 0.20 to 0.26 pCi/L. Positive correlations were noted between radon concentrations and inverse wind speed and calm periods. A negative correlation was observed between precipitation frequency and radon concentration during weekly monitoring periods.

32162 (NIRS-RSD—60, pp 13-14) **Strontium-90 and cesium-137 in airborne dust from October, 1981 to March, 1982. Environmental and dietary materials.** Mar 1982. NTIS (US Sales Only), PC A02/MF A01. File Number DE85781034.

In Radioactivity survey data in Japan.

Airborne dust was collected by an electrostatic precipitator or a filter air sampler for every three months at a rate of more than 3000 m^3 per month. The sampling was done 1 to 1.5 meters above the ground. After radiochemical separation, the precipitates were counted for the activity using a low-background beta counter, normally for 60 min. The measuring techniques are first described; i.e. the collection and pretreatment of samples, the preparation of samples for analysis, the separation of strontium-90 and cesium-137, and the counting. The measured results are given in a table for the following locations: Fukushima, Ibaraki, Niigata, Fukui, Shizuoka, Aichi, Kyoto, Osaka, Tottori, Hiroshima, Nagasaki.

32163 (NIRS-RSD—60, pp 10-12) **Strontium-90 and cesium-137 in rain and dry fallout for WHO program from January to July, 1982. Environmental and dietary materials.** Mar 1982. NTIS (US Sales Only), PC A02/MF A01. File Number DE85781034.

In Radioactivity survey data in Japan.

Rain and dry fallout was collected monthly on a sampling tray, approximately 5000 cm^2 in area, which was filled water to a depth of 1 cm at the beginning of every month. The sample was filtered after strontium and cesium carriers were added. The sample was then passed through a cation exchange column. After radiochemical separation, the precipitates were counted for the activity using a low-background beta counter normally for 60 min. The measuring techniques are first described; i.e. the collection and pretreatment of samples, the preparation of samples for analysis, the separation of strontium-90 and cesium-137, and the counting. The measured results are given in a table for the following locations: Akita, Niigata, Ishikawa, Nagano, Osaka, Okayama, Yamaguchi, Kochi, Kagoshima, Chiba.

32164 (NIRS-RSD—60, pp 5-9) **Strontium-90 and cesium-137 in rain and dry fallout for domestic program from January to July, 1982. Environmental and dietary materials.** Mar 1982. NTIS (US Sales Only), PC A02/MF A01. File Number DE85781034.

32165 **(SSI-A—84-01) Measuring stations for gamma radiation. Results 1983.** Kjelle, P.E. (Statens Straalskyddsinstitut, Stockholm (Sweden)). Jan 1984. 22p. (In Swedish). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701237.

The average values of gamma radiation as measured at five monitoring stations distributed in Sweden are presented for 1983. The results show some variation with snowcover in winter.

32166 **Radon entry into houses having a crawl space.** Nazaroff, W.W.; Doyle, S.M. (Lawrence Berkeley Lab., CA). *Health Physics;* **48**: No. 3, 265-281(Mar 1985).

The transport of ^{222}Rn from soil, through a vented crawl space, and into the living space of single-family residences was studied. Two houses were monitored in detail for periods of 5 and 7 weeks. The data suggest that, of the Rn released into the crawl space from the soil beneath the house, a significant fraction, perhaps 50% or more, enters the living space. The effect of 3 meteorological parameters - wind speed, indoor-outdoor temperature difference, and rate of barometric pressure change - on Rn concentration and entry rate were examined. In 1 of the houses a higher temperature difference corresponded to a higher indoor concentration, suggesting that the increased infiltration rate is more than compensated by an increase in the Rn entry rate. On the other hand, a high wind speed tended to reduce the indoor concentration, presumably by increasing both cross-ventilation of the crawl space and the infiltration rate of the living space. Results suggest that Rn transport into the crawl space of at least 1 of the houses occurred by pressure-driven flow, rather than solely by molecular diffusion. A third house was studied using a tracer gas injected into the crawl space at a controlled rate. The fraction of air leaving the crawl space that entered the living space ranged from 0.3 to 0.65. By sealing leaks in the floor of this house, the average infiltration rate was reduced by 25%, but the indoor concentration of the tracer gas remained constant.

32167 **Thermophoretic separation of aerosol particles from a sampled gas stream.** Postma, A.K. (to Dept. of Energy). US Patent Application 6-648,197. 7 Sep 1984. 10p. Contract AC06-76FF02170.

This disclosure relates to separation of aerosol particles from gas samples withdrawn from within a contained atmosphere, such as containment vessels for nuclear reactors or other process equipment where remote gaseous sampling is required. It is specifically directed to separation of dense aerosols including particles of any size and at high mass loadings and high corrosivity. The United States Government has rights in this invention pursuant to Contract DE-AC06-76FF02170 between the US Department of Energy and Westinghouse Electric Corporation.

32168 (DOE/ER/10231—T1, pp 87-108) **Energy supply and demand implications of CO_2.** Perry, A.M.; Fulkerson, W. (Oak Ridge National Lab., TN). 1984. NTIS, PC A07/MF A01. File Number DE85004706. Contract W-7405-ENG-26.

In Focus: energy issues for the eighties.

The concentration of atmospheric carbon dioxide (CO_2) has increased from 315 to 341 parts per million (ppm), about 8%, during the past 24 years because of the burning of fossil fuels and a progressive reduction in the mass of organic material as forests were cleared. About 59% of the emitted CO_2 has remained in the atmosphere, with the balance presumably absorbed in the oceans or by plants. The temperature changes because of this increased concentration will benefit some areas and damage others, although there is no general agreement on what constitutes an acceptable temperature increase. The authors review calculations on the effects of limiting CO_2 and conclude that 500 to 800 ppm should be the limit, which allows time for policy decisions. 20 references, 11 figures.

32169 **(STATSKONTORET—1984-21) Cadmium regulation - effects and costs.** (Statskontoret, Stockholm (Sweden)). Mar 1984. 46p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. File Number DE85750859.

The Swedish government prohibited 1979 certain use of cadmium. The regulation affects cadmium contents in some products and cadmium emission from municipal waste burning. Cadmium in fertilizers is not affected by the regulation, nor is industrial emissions. The effects of the Swedish cadmium regulation are considered so insignificant that they are not in proportion to the costs. The regulation affects maximally 1/10 of the yearly cadmium emissions of 10 tons in Sweden. The total yearly cadmium downfill is 20-40 tons. Cadmium content in arable land is reduced less than 1 percent. Control of cadmium contents in products is limited. Many companies are still importing products containing cadmium.

32171 **(NRCN—515) Estimation of the figures of merit of Mercuric-Cadmium-Telluride detectors.** Burshtein, Z. (Israel Atomic Energy Commission, Beersheba. Nuclear Research Center-Negev). May 1983. 25p. (In Hebrew). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701506.

A recipe is described for the calculation of the figures of merit of a photoconductive mercuric-cadmium-telluride detector in the far infrared (8-14 μm), on the basis of the basic physical properties of the crystalline material: the molar composition, the conductivity type, the carrier mobility and the carrier density. It is also specified how to plan the detector to obtain maximal detectivity and responsivity values for a given material.

32172 **(PNL—5501) Organic solvent alteration of hydraulic properties of sedimentary rocks of low permeability: a review.** Sklarew, D.S. (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 27p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012537.

A review of the current literature on hydrophysical interactions of organic solutes with sedimentary rocks of low permeability is presented. The motivation was the premise that low permeability rocks may act as secondary (aquifer) barriers for the containment of hazardous organic wastes, thus preventing these wastes from contaminating the groundwater. However, this premise may be incorrect if organic wastes can affect the hydraulic conductivity of these rocks. The results indicate that very little work has been done concerning interactions of organics with consolidated subsurface materials. Available information on three related topics was summarized: the effect of organic compounds on the hydrophysical properties of clays, case studies concerning the interactions of organic compounds with clays and sedimentary rocks, and the effect of shales on inorganic transport. These studies give an indication of some research areas that need to be explored with regard to the effect of organic compounds on the hydrophysical properties of sedimentary rocks; these research needs are briefly summarized. 42 refs.

32173 **(FNAL—85/32) Site environmental report for calendar year 1984.** Baker, S.I. (Fermi National Accelerator Lab., Batavia, IL (USA)). 1 May 1985. Contract AC02-76CH03000. 83p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE85012743.

During CY-1984 there were no abnormal occurrences which had an impact on the facility and its operation. In CY-1984 8.3 km^2 (2045 acres) were sprayed with 2,4-D for controlling noxious weeds. In the past as much as 10 km^2 (2500 acres) were sprayed with 2,4-D. This year no 2,4-D was used in residential areas as was necessary last year. The maximum potential radiation exposure at the site boundary during CY-1984 (fence line assuming 24 hr/day occupancy) was only 0.8 mrem compared to 0.04 mrem last year and to an average exposure of 3 mrem during conventional magnet operations from 1978 to 1982. The dose of 0.8 mrem would correspond to 0.16% of the standard of 500 mrem for an individual who is not a radiation worker (Section 5). The maximum individual potential exposure to the general population would be essentially the same because the decrease in dose rate is small between the site boundary and the location of that individual. The total potential radiation exposure to the general off-site population from Fermilab operations during CY-1984 was 4.5 person-rem compared to less than 0.1 person-rem last year when the superconducting ring was being commissioned. The primary source of potential exposure was penetrating radiation from muons this year. All exposure was from external radiation, as was the case in the past. Thus, the 50 year dose commitment from operations in 1984 is expected to be the same as the exposure received in 1984. No airborne radioactivity was released across the site boundary in CY-1984 during accelerator operations because the Neutrino Area primary beam line was not receiving protons. No tritiated water was evaporated as a means of disposal in CY-1984. The off-site release of tritium in surface water totaled approximately 150 mCi, about 23% of last year's release.

32174 **(INIS-mf—9310) Basic topical problems on health hazards from ionizing radiation. Final report.** Jacobi, W.; Paretzke, H.G.; Merkle, W.; Lechle, M.; Matthies, M.; Messerer, P.; Schindel, F.; Wirth, E.; Eisfeld, K. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.). Inst. fuer Strahlenschutz). [1985]. 225p. (In German). NTIS (US Sales Only), PC A10/MF A01. File Number DE85780933.

In the framework of this research contract, a number of important questions have been considered which have been of basic interest in radiological protection against low doses of ionizing radiation. In particular, research concentrated on the various statistical concepts for the evaluation of epidemiological data for the purpose of radiation risk analysis, derivation of dose-time-effect-relationships for certain somatic effects, time dependence of selected dose-conversion factors, radiation hazards of carbon-14, tritium, and of radon daughter products. The essential results have been reported in separate publications, and therefore will only be shortly summarized here. (orig./HP).

32175 **(INIS-mf—9574) Radionuclides in terrestrial ecosystems. Radioecological computer-based bibliography.** Howard, B.J.; Kennedy, V.H.; Nelson, A. (Department of the Environment, London (UK)). Jun 1983. 170p. NTIS (US Sales Only), PC A08/MF A01. File Number DE85701231.

A bibliographical database has been developed to provide quick access to research and background literature in the field of radioecology. This is a development of an earlier database described by Nelson (Bocock 1981). ITE's particular fields of interest have led to a subject bias in the bibliography towards studies in Cumbria, especially those concerned with radionuclides originating from the reprocessing plant at Sellafield, and towards ecological research studies that are complementary to radionuclide studies. Other subjects covered, include the chemistry of radionuclides, budgets and transfers within ecosystems and techniques for the analysis of environmental samples. ITE's research objectives have led to the establishment of a specialized database which is intended to complement rather than compete with the large international databases made available by suppliers such as IRS-DIALTECH or DIALOG. Currently the database holds about 1900 references which are stored on a 2 1/2 megabyte hard disk on a Digital PDP11/34 computer operating under a time shared system. The references follow a standard format.

32176 **(NRL—1983/6) Annual terrestrial gamma radiation dose to the population of the urban Christchurch area.** Chapman, R.H. (National Radiation Lab., Christchurch (New Zealand)). 1983. 19p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701477.

Natural terrestrial gamma radiation dose rates were measured with a high pressure ionization chamber at 70 indoor (195 site measurements) and 58 outdoor locations in the metropolitan Christchurch area. Based on these site measurements, the average gonad dose rate to the population from natural terrestrial gamma radiation was estimated to be 273+-56 microgray per annum.

32177 **(SAND—85-0551) 1984 Environmental summary: Sandia National Laboratories Tonopah Test Range, Tonopah, Nevada.** Millard, G.C.; Lathrop, L.W. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1985. Contract AC04-76DP00789. 8p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011145.

The Tonopah Test Range is located about 160 air miles northwest of Las Vegas, Nevada, and covers 525 square miles within the Nellis Air Force Base Bombing and Gunnery Range. The range is used for various DOE tests involving high and low altitude projectiles. Operations that affect the environment are mainly road construction, preparation of instrumentation sites, and disturbance of the terrain from projectile impacts. Monitoring of the test range is done annually by the US Environmental Protection Agency to supplement Sandia's monitoring effort. Monitoring results indicate that test range operations do not adversely affect the offsite environment or the public. 7 refs.

32178 **(SKBF-KBS-TR—83-34) Radionuclide diffusion and mobilities in compacted bentonite.** Torstenfelt, B.; Allard, B.; Andersson, K.; Kipatsi, H.; Eliasson, L.; Olofsson, U.; Persson, H. (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). Dec 1983. 30p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701274.

Transport rates of the fission products strontium, technetium, iodide and cesium as well as the actinides thorium, protactinium, uranium, neptunium, plutonium and americium in compacted bentonite have been studied. A sodium bentonite, Wyoming Bentonite MX-80, was used in all experiments, in a few cases mixed with 1 per cent $Fe_3(PO_4)_2$, 1 per cent Pb0 or 0.5 per cent Fe(S), or 1 per cent of one of the minerals apatite, pyrite, chalcopyrite/pyrite, cinnabar or olivine. The aqueous phase was a synthetic groundwater representative of Swedish deep granitic groundwaters, preequilibrated with the clay. Uranium and americium migration was also studied with high carbonate content and 10 mg/1 humic acid, respectively, added to the water. The diffusivity was measured in compacted clay (density 2 times 10^3 kg/m^3) and calculated from concentration profiles. The diffusivities for the fission products were of the order of 10^{-12} m^2/s under oxidizing conditions and about one order of magnitude lower for technetium under reducing conditions (Fe(s) in the clay). Penta- and hexavalent actinides had diffusivities around 10^{-13} m^2/s and tri- and tetravalent actinides around 10^{-15} m^2/s. The influence of the additives to the clay or the water was minor in the uranium systems except when Fe(s) was added to the clay, which decreased the transport rate by a factor of 10.

32179 **Determining the number and size of soil aliquots for assessing particulate contaminant concentrations.** Gilbert, R.O.; Doctor, P.G. (Pacific Northwest Lab., Richland, WA). *Journal of Environmental Quality;* **14**: No. 2, 286-292(Apr-Jun 1985). Contract AC06-76RL01830.

In this paper the planning of radionuclide and other environmental contaminant studies is discussed. This discussion is based on a study of the relationship between soil aliquot size and the variability between aliquot ^{241}Am concentrations. The study consisted of drawing multiple soil aliquots of size 1, 10, 25, 50, and 100 g from a large composite soil sample collected at a nuclear weapons testing area on the Nevada Test site. These aliquots were then analyzed for ^{241}Am. The between aliquot standard deviation (s) of the data increased ninefold as aliquot size declined from 100 to 1 g. This implies that about 70 times as many 1-g aliquots than 100-g aliquots would be needed to achieve the same precision in the estimated mean of a single field sample. The data suggest a linear relationship between logarithms of s and aliquot weight (w). This relationship is used to determine the optimum w and number, n, of aliquots per field sample that should be used. These results are also extended to a second contaminant (/sup 239, 240/Pu in this case) that is in a ratio relationship to ^{241}Am. Also, an approach is given for obtaining optimum numbers of field samples and number of aliquots per field sample to minimize either total sampling and analysis costs or the variance of the estimated mean. The aliquot data from the ^{241}Am study indicate increasing median and geometric mean concentrations with increasing aliquot size. This happens because as aliquot weight increases there is a decrease in skewness of the frequency distribution of aliquot concentrations. Since the arithmetic mean is not affected (on the average) by a change in skewness, it may be preferred to the geometric mean or median when comparing results from studies that have used different aliquot sizes.

32180 **(EGG—1183-2356-Pts.1-2) Status of endangered and threatened plant species on Nevada Test Site: a survey, Parts 1 and 2. Appendix C: collection records for the taxa considered.** Cochrane, S. (EG and G, Inc., Goleta, CA (USA). Santa Barbara Operations). Mar 1979. Contract AC08-76NV01183. 100p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85011766.

This inventory of herbarium collections is a compilation of information on plant specimens seen by the author in major herbaria of California, Nevada, and Utah, and in the Missouri Botanical Garden and the US National Herbarium. Other information garnered from individuals and from records listed in Beatley, 1977a, b, and c is also included. The report is meant to provide more precise species locations and distribution data to assist those making decisions about species status, so that protective measures can be taken when deemed necessary.

32181 **(AECL—8178) LEEM - a lake energy and evaporation model user's manual.** Barry, P.J.; Robertson, E. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Nov 1983. 94p. NTIS (US Sales Only), PC A05/MF A01. File Number DE85701224.

LEEM is a simplified one-dimensional computer model of the energy budgets of lakes. It is intended to be used operationally to estimate evaporation rates averaged over several days using synoptic meteorological data with only the initial water temperatures being specified. These may usually be taken to be 4 deg. C a few days after spring break-up. This report describes the theoretical basis of the model and the algorithms by which these are converted to computer code. The code itself is included together with an exemplary set of data cards and the corresponding output.

32182 **(GAT-S—32) Investigation of fluidized-bed biological denitrification.** Acox, T.A. (Goodyear Atomic Corp., Piketon, OH (USA)). 16 Dec 1982. Contract AC05-76OR00001. 41p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012803.

The performance of the fluidized-bed bioreactor was modelled for denitrification using a multiple linear regression. Reasonable accuracy was obtained; however, this type of analysis did not take into account the hydraulic characteristics of the fluidized-bed. The Mulcahy and LaMotta computer program previously used to model a fluidized-bed bioreactor cannot be used in this case due to the Michaelis-Menton constant k determined in this study, which was one to two orders of magnitude lower. With some additional bioreactor study and computer program modification, this may prove to be of some benefit.

32183 **(IFIN-RB—5-1981) Method of radioactive tracer samples with ion exchange resins for spectrometric analysis with Ge(Li) detector.** Stanescu, S.P.; Farcasiu, O.M. (Institutul Central de Fizica, Bucharest (Romania)). Jul 1981. 18p. (In Romanian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701238.

The radioactive tracers methods presently in use in hydrology are based on "in situ" low resolution gamma-ray spectrometry measurements. However sometimes the information obtained in this way is not conclusive and the need for better spectrometry systems is evident. Therefore the authors present a method for measuring in laboratory conditions samples of radioactive tracers collected "in situ" and concentrated on ion exchange resins, using low level gamma-ray spectrometry with Ge(Li) detector. The advantages of this method in comparison with the methods based on Na(Tl) detectors are also presented in the paper.

32184 (WSD-Misc—49, pp 146-149) **Use of radioactive isotopes as tracers in rivers.** Barry, B.J.; McCabe, W.J. (Department of Scientific and Industrial Research, Lower Hutt (New Zealand). Inst. of Nuclear Sciences). 1982. NTIS (US Sales Only), PC A08/MF A01. File Number DE85780944. (CONF-8111226—).

From River and estuary mixing workshop; Hamilton, New Zealand (17 Nov 1981).

The use of radioisotopes for studying mixing in rivers is discussed from a practical point of view. The unique features of the technique, its advantages and disadvantages, its sensitivity and its cost are all considered so that those interested in tracing work should be able to make at least a preliminary assessment of its potential value to them.

32185 **(WSD-Misc—49) Proceedings of the River and Estuary Mixing Workshop, Hamilton, 17-18 November 1981.** Rutherford, J.C. (ed.). (Ministry of Works and Development, Hamilton (New Zealand). 32186 (DOE/CH/00016—T6) Anaerobic microbial transformations in subsurface environments: project description. Francis, A.J. (Brookhaven National Lab., Upton, NY (USA)). Apr 1985. Contract AC02-76CH00016. 39p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012789.

Both laboratory and field investigations were conducted to understand the basic biochemical processes involved in the anaerobic transformation of trace metals and selected organic compounds. Controlled laboratory experiments consist of dissolution of trace metals such as As, Cd, Cr, Hg, Mn, Ni, and Pb from model substrate. The effects of the environmental variables such as temperature, pH, O_2 tension, moisture, carbon, nitrogen and alternate electron acceptors that may accelerate or reduce biochemical processes in subsurface environments are being investigated. In concert with laboratory research, field studies in the Appalachian region consist of water leachate and soil/waste core sample collection, and physical, chemical and biological characterizations to develop an improved understanding of anaerobic microbial processes. Laboratory observations and processes will be verified and experimental designs will be modified, using information obtained under actual field conditions. The results generated from this basic scientific study will increase our understanding of the biochemical transformations of toxic substances in subsurface environments.

32187 (DOE/ER—0222) Multi-solute subsurface transport modeling for energy solid wastes: highlights FY 1984. Theis, T.L.; Kirkner, D.J.; Jennings, A.A. (Clarkson Univ., Potsdam, NY (USA); Notre Dame Univ., IN (USA)). Jan 1985. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012788.

At the present time a general multi-solute model, FIESTA, has been developed which combines the chemical processes of ion exchange, adsorption and complex formation, and the physical factors of convection and dispersion. Present research, highlighted in this report, is aimed at incorporating solubility reactions and a general kinetic, rather than equilibrium, approach to the chemical interactions.

32188 (Juel-Spez—276) Methods of ecotoxicological evaluation of chemicals. Vol. 5. Scheele, B.; Fuehr, F.; Stuettgen, E. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Projekttraeger fuer Umweltchemikalien). Oct 1984. 269p. (In German). NTIS (US Sales Only), PC A12/MF A01. File Number DE85752000.

The following report presents the results of nine research projects being the second part of an extensive program under the title 'Methods of ecotoxicological evaluation of chemicals'. This program has been sponsored in connection with legislative activites related to the regulation of trading with chemicals since 1978 by the Dept. of Research and Technology. In all testing procedures under this program 'Reference chemicals' had been used in order to more correctly evaluate the efficiency of comparable methods as well as to compare with the known behavior of the chemicals in the environment. Seven of the testing methods presented on this volume deal with the evaluation of the toxic potential of a chemical. Two of these use calorimetric systems. Furthermore one test method refers to the anaerobic degradation of chemicals. The first part of this project is described in volume one.

32189 (LBL—6878) Survey of instrumentation used for monitoring metals in water. Quinby-Hunt, M.S. (Lawrence Berkeley Lab., CA (USA)). Jun 1978. Contract W-7405-ENG-48. 38p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012008.

A study was conducted of instrumentation used to determine metals in water. Several of the techniques most commonly used for analysis and routine determinations of metals in water are shown in Table 1. They are atomic absorption spectroscopy, both flame and flameless, atomic emission spectroscopy using conventional flame sources and inductively-coupled plasma sources, and ultraviolet-visible absorption techniques. Other less frequently employed methods are x-ray fluorescence analysis using both photon and charged particle excitation with energy-dispersive and wavelength-dispersive spectral analysis. Also electrochemical techniques and activation analysis are studied.

32190 (PB—85-155695/XAB) Cost digest: cost summaries of selected environmental control technologies. Report for January 1981-June 1982. DeWolf, G.; Murin, P.; Jarvis, J.; Kelly, M. (Radian Corp., Austin, TX (USA)). Oct 1984. 107p. (RAD—82-203-001-47-03). NTIS, PC A06/MF A01.

The report summarizes cost data on over 20 environmental control technologies. The cost parameters presented include total capital investment, net annual operating expenses, and unit annualized costs. These cost estimates are given over an appropriate range of system capacities for six technologies in drinking water treatment (e.g., granular activated carbon), eight technologies in wastewater treatment (e.g., conventional secondary and advanced), four particulate matter control technologies (e.g., fabric filters), and six flue gas desulfurization technologies (e.g., lime/limestone scrubbing). For each technology, the report contains a short narrative summary, a block flow diagram with battery limits noted around the modules included in the cost estimate, design specifications, performance characteristics, and a discussion of major factors affecting cost. All costs are given in March 1980 dollars.

32191 (BG-Trans—6440) Method of wet oxidation treatment of waste water. Kimoto, Sanemi; Harada, Yoshiaki; Ueda, Tomonori. (British Gas Corp., London; Osaka Gas Co. Ltd. (Japan)). 26 Mar 1985. Translation of Japanese Patent Application 59-115786, 1982. 5p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85901525.

A method is claimed for treating waste water by wet oxidation. Waste water with pH 9 or higher, and a water soluble ruthenium salt or palladium salt or both are fed into a reactor containing a corrosion-resistant granular carrier so that ruthenium and/or palladium is precipitated on to the granular carrier surface. The temperature of the waste water is kept at 100 to 370°C and the pressure is maintained such that the waste water retains a liquid phase. A gas is supplied which contains oxygen in a quantity which is 1 to 1.5 times the theoretical quantity needed for decomposing the COD constituents and/or ammonia in the waste water. An alkaline substance is also added to the system so that pH of the liquid after oxidation becomes 5 to 8. Examples of corrosion-resistant granular carrier are titania, zirconia, and other ceramic materials and porous metals such as Ni, Ti, Ti-Pd alloys and high Ni alloys. Examples of water soluble ruthenium and palladium salts used as catalyst active constituent source are: $RuCl_3$, Na_2RuO_4, K_2RuO_4, $PdCl_2$, $PdSO_4$ and $Pd(NO_3)_2$. The oxygen source may be air, oxygen-enriched air, oxygen, waste gases containing oxygen and the like.

32192 (DEMO—82/14) Radioecological studies in marine environment. A study of the concentration of mixed fission products in Greek sea waters and of ^{137}Cs in fish and sea plants. Danali-Cotsaki, S.; Florou-Gazi, H. (Democritos Nuclear Research Center, Athens (Greece)). Dec 1982. 22p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701232.

The concentrations of mixed fission products in sea water and of ^{137}Cs in fish and sea plants are different from samples collected from different sampling areas. This difference is more remarkable the year where the level of the worldwide fall-out is higher, especially with regards to M.F.P. concentrations in sea water samples. Increases or decreases of M.F.P. concentrations in sea water samples result to increases or decreases of ^{137}Cs in fish and sea plants.

32193 (DEMO—83/10G) **Isotope hydrology study of Kato Nevrokopi, Drama Dept.** Leontiadis, I.L.; Payne, B.R.; Letsios, A.; Papayanni, N.; Kakarelis, D.; Hadjiagorakis, D. (Democritos Nuclear Research Center, Athens (Greece)). Jul 1983. 47p. (In Greek). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701463.

Data.

The isotopic composition of the water was used in order to define the mechanism of recharge of the high plateau of Kato Nevrokopi. The results of this study have shown that the groundwater reservoir of the high plateau is mainly fed by waters originating from the mountain Falakro and the Vathytopos stream; the local rains do not contribute significantly to the recharge of its groundwater. An underground barrier prevents the draining of the groundwater through the sinkhole resulting in a very big reservoir under the whole central and southern parts of the high plateau. The exploitation of the groundwater of this reservoir offers very probably the solution for the satisfaction of all needs of the area for irrigation water at low cost.

32194 (IAEA-TECDOC—301) **Behaviour of radium in waterways and aquifers. Final report of the Coordinated Research Programme on source, distribution, movement and deposition of radium in inland waterways and aquifers sponsored by the IAEA from 1976 to 1980.** (International Atomic Energy Agency, Vienna (Austria)). Jan 1984. 262p. NTIS (US Sales Only), PC A12/MF A01. File Number DE85701047.

The Coordinated Research Program was designed to develop systematic information on the form and movement of radium in water under a range of environmental conditions. The final report contains: a) Selection and standardization of methods for determination of radium in water; b) The distribution of soluble and insoluble radium in natural waters, affected by mining or milling operations; c) The factors affecting the leaching rate from ore heaps and tailings piles; d) The uptake of radium by biological systems, especially those which form part of man's food chain. This information being of great value to those authorities responsible for assessing the consequences of radium releases to water and to those responsible for setting discharge limits.

32195 (INS-R—317) **Non-terrestrial food source for Fiordland brachiopods. Carbon isotope evidence.** Lyon, G.L.; Richardson, J. (Department of Scientific and Industrial Research, Lower Hutt (New Zealand). Inst. of Nuclear Sciences). May 1983. 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701471.

Contains appendix, "Radiocarbon study of brachiopods in Fiordland".

Carbon-13 analyses were determined for brachiopods and particulate organic matter from Fiordland waters. Brachiopod delta ^{13}C are about $^{-18}$ per mille which is significantly enriched in ^{13}C relative to the particulate matter (about -23 per mille) and different from local terrestrial matter (about -28 per mille). There is no carbon-13 evidence for non-marine food in the diet of brachiopods.

32196 (INS-R—320) **Deuterium in New Zealand rivers and streams.** Stewart, M.K.; Cox, M.A.; James, M.R.; Lyon, G.L. (Department of Scientific and Industrial Research, Lower Hutt (New Zealand). Inst. of Nuclear Sciences). Jul 1983. 42p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701464.

Over 750 deuterium measurements on rivers and streams in New Zealand are reported. Monthly samples were collected for periods of several years from a number of representative rivers. These show irregular storm-to-storm as well as seasonal deuterium variations. The seasonal variations range from as low as 1 per mille for lake-fed rivers to 8-10 per mille for rivers with large spring snowmelt contributions. Variations in mean annual γD values are believed to reflect changes in climatic variables; the present data will be used to compare with future changes. The bulk of the data are single samples; these show a geographic variation related to the altitude, latitude and climatic character of the catchments, with the highest deuterium contents (γD = -20 per mille) occurring in the far north, and lowest contents (-80 per mille) in the inland Otago region. Regression equations derived for the γD dependence on altitude (h) and latitude (l), are $\gamma D = -0.0169\ h - 30.2$ and westerly influence. Eastern climatic zones have lower deuterium contents because of rainout effects on the axial ranges. Contours of constant.

32197 (NIRS-M—41, pp 262-270) **Recent environmental tritium levels in Japan.** Iwakura, T.; Inoue, Y.; Tanaka, K.; Kasida, Y. (National Inst. of Radiological Sciences, Chiba (Japan)). Mar 1982. NTIS (US Sales Only), PC A15/MF A01. File Number DE85781032. (CONF-811082—).

From Workshop on tritium radiobiology and health physics; Chiba, Japan (1 Oct 1981).

Data of the tritium surveillance program are summarized for the period of 1967 through 1980. Samples of surface water, tap water, coastal sea water and ground water were collected from environs of commercial nuclear power plants and nuclear facilities, and were analyzed by liquid scintillation counting. Although the results show some differences in tritium concentrations in water samples from various part of the country, there is a general tendency of the concentration in surface waters to decline as a function of time. This implies that environmental waters in Japan generally have not been influenced by the discharged effluents of the facilities or the stations with regard to tritium contamination and that the tritium content of precipitation still plays the dominant role in reflecting annual variation of tritium concentration in surface waters.

32198 (NIRS-RSD—60, pp 18) **Strontium-90 and cesium-137 in freshwater from December, 1981, to July, 1982. Environmental and dietary materials.** Mar 1982. NTIS (US Sales Only), PC A02/MF A01. File Number DE85781034.

In Radioactivity survey data in Japan.

Freshwater of 100 liters each was collected. The water, to which the carriers of strontium and cesium were added immediately after sampling, was vigorously stirred and filtered. The sample was then passed through a cation exchange column. After radiochemical separation, the precipitates were counted for the activity using a low-background beta counter, normally for 60 min. The measuring techniques are first described; i.e. the collection and pretreatment of samples, the preparation of samples for analysis, the separation of strontium-90 and cesium-137, and the counting. The measured results are given in a table for the following locations: Fukui, Nagano, Kyoto, Hiroshima, Ibaraki, Hokkaido, Akita.

32199 (NIRS-RSD—60) **Radioactivity survey data in Japan.** (National Inst. of Radiological Sciences, Chiba (Japan)). Mar 1982. 21p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85781034.

Items within the scope of EDB have been entered individually into the data base.

32200 (RI—176) **Study on radioactive contamination of the Baltic Sea in 1979-1980.** Salo, A.; Pukhakainen, M.; Saksen, R.; Tuomainen, K.; Lazarev, L.N.; Gedeonov, L.I.; Ivanova, L.M.; Orlova, T.E.; Tishkova, N.A.; Vakulovskij, S.M. (Radievyj Inst., Leningrad (USSR)). 1983. 33p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701048.

The results of joint investigation of radioactivity in the Baltic Sea, provided by the Institute of Radiation Protection (Helsinki, Finland) and the Khlopin Radium Institute (Leningrad, USSR) in 1979 and 1980 are reported. The comparison of results of intercalibration of the methods for determination of ^{90}Sr and ^{137}Cs in water samples showed that the difference was about 30%. A good agreement was found on the stage of preparations activity measurements. An essential difference of concentrations of ^{90}Sr and ^{137}Cs in water of the Baltic Sea proper and its gulfs between 1979 and 1980 was not revealed. The penetration of sup(134, 137)Cs from the North Sea to the south-western part of the Baltic Sea was detected by the Institute of Experimental Meteorology (USSR) in 1980. The data on concentrations of ^{90}Sr and ^{137}Cs in fifteen rivers falling into the Baltic Sea from Finland and USSR were summarized. The concentrations of ^{90}Sr, ^{137}Cs and sup(239, 240)Pu in bottom sediments in some regions of the Baltic Sea were estimated. The data on ^{3}H and sup(239, 240)Pu concentrations in the Baltic Sea waters in the vicinity of Loviisa and Olkiluoto nuclear power stations were reported.

32202 **(DES—74-24) Draft supplement to the environmental statement fiscal year 1975 proposed program. Facility location evaluation for Sappho service study area 75-13.** (Bonneville Power Administration, Portland, OR (USA)). 8 Mar 1974. 24p. NTIS, PC A02/MF A01. File Number DE85014192.

The proposed plan for meeting electrical requirements consists of the construction of a new substation near the town of Sappho located in Clallam County, Washington. Land requirements for the new substation would be approximately 3.6 acres and, depending upon the actual site location chosen, an access road ranging from 100 to 800 feet in length would also be required. As a result of the construction of the proposed facility, from 1.6 to 6 acres of timberland would be permanently removed from production. Disturbance of game in the immediate vicinity of the route would occur during construction, as would some soil erosion primarily during and immediately after construction, siltation in nearby streams, disturbance of nearby residents from noise and dust during construction, and some degradation of AM reception immediately adjacent to the right-of-way. 2 figs.

32203 **(DES—74-25) Draft supplement to the environmental statement fiscal year 1975 proposed program. Facility location evaluation for Ashe-Hanford 500-kV transmission line study area 74-3.** (Bonneville Power Administration, Portland, OR (USA)). 8 Mar 1974. 43p. NTIS, PC A03/MF A01. File Number DE85014197.

Proposed construction of a 17.8-mile 500-kV single-circuit line running from BPA's Ashe Substation Site near the Hanford No. 2 nuclear power plant site to the existing Hanford Switching Station. This facility would be located entirely within the Hanford Reservation of the Atomic Energy Commission north of the City of Richland in Benton County, Washington. Construction of the proposed transmission line would require a total right-of-way easement of approximately 612 acres through grassland. That area actually occupied by the tower footings would be removed from rangeland uses. Disturbance of game in the immediate vicintiy of the route will occur during construction as will some soil erosion primarily during and immediately after construction, siltation in nearby streams, distrubance of nearby residents from noise and dust during construction, and some degradation of AM reception immediately adjacent to the right-of-way. 10 figs.

32204 **(DES—74-26) Draft supplement to the environmental statement fiscal year 1975 proposed program. Facility location evaluation for San Juan Island service study area 74-7.** (Bonneville Power Administration, Portland, OR (USA)). 8 Mar 1974. 41p. NTIS, PC A03/MF A01. File Number DE85014195.

Proposed construction of a 1.7-mile 34.5-kV double-circuit transmission line crossing Decatur Island from east to west. The new line would replace 0.7 of a mile of an existing BPA 24.5-kV line and would then parallel and existing 24.5-kV line for a distance of 1.0 mile. The proposal also requires the construction of a new substation to be located on the eastern side of Lopez Island, Washington. The additional easement required for the proposed transmission line would remove about 1.1 acres of forestland from timber production diverting it to nonforest uses compatable with the transmission line right-of-way. Depending upon the actual site location the Lopez Island Substation could remove from 1 to 3.2 acres of forestland and 2 acres of pastureland from production. Disturbance of game in the immediate vicintiy of the transmission facilities will occur during construction, as will some soil erosion primarily during and immediately after construction, siltation in nearby streams, disturbance of nearby residents from noise and dust during construction, and some degradation of AM reception immediately adjacent to the right-of-way. 7 figs.

32205 **(DES—74-36) Draft supplement to the environmental statement fiscal year 1975 proposed program. Facility location supplement for Maple Valley 500-kV reinforcement study area 75-14.** (Bonneville Power Administration, Portland, OR (USA)). 1975. 77p. NTIS, PC A05/MF A01. File Number DE85014194.

The proposed plan of service consists of the construction of approximately 16 miles of double-circuit 5000kV transmission line. Of this total length 2.5 miles will require new right-of-way easement, 8.25 miles would parallel existing transmission lines, and 7.25 would occur on existing right-of-way. In addition, a new substation will also be required southwest of Snoqualmie, Washington. Construction of the proposed 16-mile transmission line would require approximately 134 acres of new right-of-way easement. About 6.5 miles of the line's length would traverse forested land resulting in the removal of about 105 acres from the production of timber. Construction of the new Snoqualmie Substation would require about 25 acres of land and depending upon the actual site selected would remove from 20 to 25 acres of forest land from production. Also expected to occur is the disturbance of game in the immediate vicinity of the facilities during construction, some soil erosion primarily during and immediately after construction, siltation in nearby streams, disturbance of nearby residents from noise and dust during construction, and some degradation of AM reception immediately adjacent to the right-of-way. 16 figs.

32206 **(DES—75-27) Draft supplement to the environmental statement fiscal year 1976 proposed program. Facility location evaluation for Hangman Creek Area service study area 76-8.** (Bonneville Power Administration, Portland, OR (USA)). 15 Apr 1975. 33p. NTIS, PC A03/MF A01. File Number DE85014198.

Proposed construction of a substation near Hangmen Creek, south of Spokane, Washington. Summary of environmental impacts and adverse environmental effects: approximately 3 acres of grass and shrubs would be removed for the proposed substation. Depending upon the final site selected, a few trees could be removed. Some siltation to Hangman Creek would occur. Other impacts would include the removal of wildlife habitat associated with the above mentioned substation site requirements. Disturbance to wildlife during construction would occur. Some erosion and sedimentation would occur along with a certian degree of visual impact. 2 figs., 2 tabs.

32207 **(DES—75-51) Draft supplement to the environmental statement fiscal year 1977 proposed program. Facility location evaluation for Hot Springs-Bell 500-kV line study area 76-6.** (Bonneville Power Administration, Portland, OR (USA)). 16 Sep 1975. 99p. NTIS, PC A05/MF A01. File Number DE85014196.

Proposed construction of between 146 and 165 miles of 500-kV transmission line between Hot Springs, Montana, and Bell Substation, immediately north of Spokane, Washington. Depending upon the final route location chosen, between approximately 146 and 165 miles of 500-kV transmission line between Hot Spring Substation and Bell Substation over parallel and new right-of-way would be required. Between 15 and 70 miles of new access road would also be required. Land use affected would include clearing from 2153 to 2503 acres of timber. Depending upon the route location chosen, between 3 and 4 acres of farmland would be removed from production and between 110 and 165 acres temporarily disrupted. Other impacts would include the removal of wildlife habitat associated with the above mentioned right-of-way requirements. Distrubance would occur. Visual impacts would result from clearing right-of-way through heavily forested areas. Noise and other disturbances to residents will occur, primarily during construction. 15 figs. 2 tabs.

32208 **(FES—74-50) Final environmental statement: proposed fiscal year 1975 program, Bonneville Power Administration.** (Bonneville Power Administration, Portland, OR (USA)). 23 Aug 1974. 212p. NTIS, PC A10/MF A01. File Number DE85014193.

Proposed construction of Fiscal Year 1975 New Facility additions to BPA's electric transmission system including approximately 435 miles of transmission lines; 8 new substations and related structures; maintenance of 12,373 miles of existing transmission lines including tower structures, conductors, and access roads; control of vegetation on approximately 15,300 acres of transmission line rights-of-way and 852 acres of substation property. The Fiscal Year 1975 Proposed Program would result in the diversion of approximately, 1100 acres of forested land to other land uses compatible with multiple use management; the permanent removal of all vegetative cover from 200 to 250 acres (depending upon actual access road requirements); the removal of 26 acres of cropland from production and a decrease in production on an additional 14 acres of cropland immediately around the new towers; visual impacts to 5 recreational waterways, and 10 scenic and/or potentially scenic roadways; disturbance of topsoil, temporary wind and water erosion, and a resultant increase in siltation and turbidity in 9 major waterways and numerous small and intermittent streams with consequential temporary adverse effects on fish mortality and spawning habitat; the introduction of particulates and combustion byproducts into the atmosphere during open burning of slash; introduction of herbicides into the environment; temporary reduction in wildlife habitat due to herbicides and clearing operations; audible noise during operation of construction equipment and transmission lines; increased risk of man-caused accidents; and maintenance of a high standard of living and level of productivity for the Pacific Northwest through continued availability of realiable electric service. 1 fig.

32213 **(CONF-8506115—1) Automated analysis of digital images generated by two-dimensional gel electrophoresis.** Mann, R.C.; Mansfield, B.K.; Selkirk, J.K. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 11p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011906.

From 2. international congress of applied pattern recognition; Amsterdam, Netherlands (19 Jun 1985).

Two-dimensional gel electrophoresis is a method to separate proteins according to their molecular weights and mobilities in an electric field at a certain pH value. The presence of a radioactively or fluorescently labeled protein in a preparation is indicated by a spot that is produced on a film with the intensity of the spot indicative of the amount of protein. This article presents algorithms that accomplish automated quantitative analysis of digitized gel images. The limits of currently available analysis systems are discussed. The methods are implemented by software on a commercially available digital image processor that uses a minicomputer host. 13 refs., 4 figs., 3 tabs.

32214 (PUC-TN—20/83) **EPR studies of cooperative binding of Cu (II) to hemoglobin.** Louro, S.R.W.; Tabak, M. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Jul 1983. 10p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701466.

The investigation of the relative affinities of the two pairs of hemoglobin copper sites by monitoring the EPR spectra of the complexes formed by the reaction of copper with deoxyhemoglobin is reported. A model in which two sites are assumed to accept copper ions in a noncooperative way is not able to predict the experimental results. Thus it is conclude that the binding of these ions to hemoglobin is a cooperative phenomenon.

32215 (PUC-TN—30/83) **Location of the higher affinity copper site on human hemoglobin by the use of the spin label technique.** Tabak, M.; Louro, S.R.W. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Nov 1983. 21p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701467.

Addition of copper (II) ions to Cys β-93 maleimide spin-labelled human hemoglobin A produces a dramatic decrease in the amplitude of the spin-label ESR spectra. This effect was analyzed in the framework of Leigh's theory which permits interspin distances to be deduced from the effect of dipolar coupling on the ESR spectra and led to an estimate of 9A as the distance between the label and the higher affinity copper site. Taking into account the previous results which suggest that four nitrogen atoms coordinate with copper, and that the N terminal val β-1 and His β-2 residues are involved, the location of the higher affinity copper site is proposed to be at the β_1 β_2 interface of the hemoglobin molecule, involving the N terminal of one β subunit and the C terminal of the other.

32216 (SERI/PR—231-2619, pp 57-58) **Primary photosynthesis studies.** Seibert, M. (Solar Energy Research Institute, Golden, CO). Jan 1985. OSTI. File Number TI85002934.

In Solar Energy Research Institute Biomass Program. Quarterly technical report, first quarter FY 1985.

The project's objective is to improve the understanding of primary and secondary electron transport in various photosynthetic systems by developing new means to probe these reactions that will differentiate between the mechanisms involved. Two approaches were planned. Bacterial reaction center monolayers, transferred to solid substrates to study their optical and electromechanical properties, were to be used to reconstruct the photosynthetic electron transport apparatus independent of the biological membrane. This would allow the fabrication of better model energy conversion systems and the analysis of electron transport pathways. Also, oxygen evolution (a means of monitoring water-splitting in green plant photosynthesis) in active PS II membranes was studied to determine the mechanism of the process in these new preparations. The membranes were further characterized by fluorescence, luminescence, and spectrophotometric analysis. Biochemical and electron micrographic comparisons were also made. Studies under way will emphasize the proteins of PS II, their function, and their relationships to the structure of the PS II membrane and water splitting.

32217 (ZfI-Mitt—77, pp 84-91) **Chromatographic separation of NPN compounds as a routine method for the analytical evaluation of ^{15}N tests in man (with special reference to hepatopathies).** Hirschberg, K.; Jung, K. (Akademie der Wissenschaften der DDR, Leipzig. Zentralinstitut fuer Isotopen- und Strahlenforschung); Matkowitz, R. (Bezirkskrankenhaus Leipzig (German Democratic Republic). Chirurgische Klinik). Sep 1983. (In German). NTIS (US Sales Only), PC A14/MF A01. File Number DE85780083. (CONF-8305218—Summ.).

From Recent results of /sup 15/N tracer technique in medicine symposium; Rostock, German D.R. (29 May 1983).

In healthy test persons and in patients with hepatopathies the main metabolic non-protein nitrogen (NPN) compounds in blood serum and urine were determined chromatographically using ^{15}N-glycine as tracer.

32218 **Immunological investigation of the distribution of cytochromes related to the two terminal oxidases of Escherichia coli in other gram-negative bacteria.** Kranz, R.G.; Gennis, R.B. (Univ. of Illinois, Urbana). *Journal of Bacteriology;* **161**: No. 2, 709-713(Feb 1985). Contract AC02-80ER10682.

Monospecific antibodies were raised against the two terminal oxidase complexes of the aerobic respiratory chain of Escherichia coli. These are the cytochrome d and cytochrome o complexes. The antibodies were used to check for the occurrence of cross-reactive antigens in membrane preparations from a variety of gram-negative bacteria by rocket immunoelectrophoresis and immunoblotting techniques. With these criteria, proteins closely related to the cytochrome d complex of E. coli appeared to be widely distributed. Among the strains containing cytochrome d-related material were Serratia marcescens, Photobacterium phosphoreum, Salmonella typhimurium, Klebsiella pneumoniae, and Azotobacter vinelandii. The data suggest that the d-type terminal oxidase in many of these strains is associated in a complex with b-type and a_1-type cytochromes, as has been found to be the case in E. coli. K. pneumoniae and S. typhimurium were also shown to have material cross-reactive to the E. coli cytochrome o complex.

32219 **Isolation and characterization of an Escherichia coli mutant lacking the cytochrome o terminal oxidase.** Au, D.C.T.; Lorence, R.M.; Gennis, R.B. (Univ. of Illinois, Urbana). *Journal of Bacteriology;* **161**: No. 1, 123-127(Jan 1985). Contract AC02-80ER10682.

A respiration-deficient mutant of Escherichia coli has been isolated which is unable to grow aerobically on nonfermentable substrates such as succinate and lactate. Spectroscopic and immunological studies showed that this mutant lacks the cytochrome o terminal oxidase of the high aeration branch of the aerobic electron transport chain. This strain carries a mutation in a gene designated cyo which is cotransducible with the acrA locus. Mutations in cyo were obtained by mutagenizing a strain that was cyd and, thus, was lacking the cytochrome d terminal oxidase. Strain RG99, which carries both the cyd$^-$ and cyo$^-$ alleles, grows normally under anaerobic conditions in the presence of nitrate. Introduction of the cyd$^+$ allele into the strain restores the respiration function of the strain, indicating that the cytochrome o branch of the respiratory chain is dispensable under normal laboratory growth conditions.

32220 **Structure and synthesis of histopine, a histidine derivative produced by crown gall tumors.** Bates, H.A.; Kaushal, A.; Deng, P.N.; Sciaky, D. (State Univ. of New York, Stony Brook). *Biochemistry;* **23**: No. 14, 3287-3290(3 Jul 1984). Contract AC02-76CH00016.

Histopine, an unusual amino acid derivative of histidine isolated from crown gall tumors of sunflowers (Helianthus annus) inoculated with Agrobacterium tumefaciens strain B_6, was previously assigned the gross structure N-(1-carboxyethyl)histidine. A diastereomeric mixture containing histopine was readily prepared by reductive alkylation of (S)-histidine with pyruvic acid and sodium cyanoborohydride. The individual diastereomers were prepared by reaction of (S)-histidine with (R)- and (S)-2-bromopropionic acid. (R)-N-(1-Carboxyethyl)-(S)-histidine supports the growth of A. tumefaciens whereas (S)-N-(1-carboxyethyl)-(S)-histidine is inactive.

32221 **Secretory products of macrophages and their physiological functions.** Takemura, R.; Werb, Z. (Univ. of California, San Francisco). *American Journal of Physiology;* **246**: No. 2, C1-C9(Feb 1984).

Macrophages secrete a variety of biologically active substances into their local milieu, including proteins, lipids, nucleotide metabolites, and oxygen metabolites. To date, more than 50 substances secreted by macrophages have been reported: enzymes, enzyme inhibitors; plasma proteins such as complement components, coagulation factors, and apolipoprotein E; factors that regulate the functions of other cells such as interferon, interleukin 1, mitogens, and angiogenesis factor; and low molecular weight substances such as reactive metabolites of oxygen and derivatives of arachidonic acids. Macrophage-derived products are probably important in the local environment, and they are believed to be important in the physiological and pathological functions of macrophages in inflammation, tissue repair, lipoprotein metabolism, acute phase response, and in microbicidal, antiviral, tumoricidal, and immunoregulatory activities; however, macrophages may not be the sole source for the secretion of some of these products. The secretion of these products is intricately regulated, developmentally and environmentally.

32222 **Characterization of sheep lung lymph lipoproteins: chemical and physical properties.** Forte, T.M.; Cross, C.E.; Gunther, R.A.; Kramer, G.C. (Univ. of California, Berkeley). *Journal of Lipid Research;* **24**: 1358-1367(1983).

The authors have determined the composition and distribution of plasma and lung lymph lipoproteins from unanesthetized ewes. Cholesterol, triglyceride, and phospholipid levels in lung lymph were 45%, 50%, and 50%, respectively, of those in plasma. Lipoproteins from both lymph and plasma were separated into two major fractions: d $<$ 1.063 g/ml or LDL, and d 1.063-1.21 g/ml or HDL. HDL was the major lipoprotein species in the plasma and lymph. Gradients gel electrophoresis of HDL on 4-30% gels showed that, in lymph, HDL particles were shifted to larger sizes; in addition to a peak at 8.5 nm, which was similar to plasma HDL, there were two additional components of larger size, one at 9.2 nm and the other at 12 nm. Electron microscopy revealed that lymph HDL contained two new particles not seen in plasma: large, round particles, 13.6 nm diameter, and discoidal particles, 18.7 by 4.9 nm, long and short axis, respectively. Compositional analysis of lymph HDL revealed a relative enrichment in free cholesterol as well as an enrichment in apolipoprotein E. Lymph LDL on gradient gel electrophoresis was extremely heterogeneous. Several peaks were evident in the 23-30 nm size range (similar to plasma LDL), but a supplementary component at approximately 15-16 nm was also present. Whereas plasma LDL on electron microscopy contained only round particles 26 nm in diameter, lymph contained an additional, unusual particle which was close-packed, with square geometry, and was 15 nm in diameter. Changes in the physical and chemical properties of lung lymph lipoproteins suggest that these particles are metabolically modified.

32223 **Release of 3-methyladenine from nucleosomal DNA by a 3-methyladenine DNA glycosylase.** Price, J.A.; Heller, E.; Goldthwait, D.A. (Case Western Reserve Univ., Cleveland, OH). *Carcinogenesis (New York);* **4**: No. 2, 145-152(1983). Contract AC02-76EV02725.

Nucleosomes from chicken erythrocytes, with DNA containing an average of 144 base pairs, were alkylated with $[^3H]$methylnitrosourea. The level of alkylation of the nucleosomal DNA was 48% of that of free DNA. The histones had approximately one tenth the radioactivity of the DNA. There was no statistically significant difference between alkylation of nucleosome bases in the major vs. minor groove. When the first 50 residues of the alkylated nucleosomal DNA were examined on sequencing gels, the 7-methylguanine and 3-methyladenine (3-MeA) residues were distributed randomly. The 3-MeA DNA glycosylase I of E. coli was used to measure the release of 3-MeA groups of the nucleosomal DNA. A partially purified 3-MeA DNA glycosylase from rat liver gave similar results. The limited enzymatic release is most likely due to steric hindrance of the enzyme by the DNA-Histone interactions on the surface of the core particle. An alteration of nucleosomal conformation has been suggested as an explanation for repair of nucleosomal DNA. Two model systems have been examined. The addition of ethidium bromide to alkylated nucleosomes increased the enzymatic release of 3-MeA to ~75% and altered the electron microscopic appearance. The chemical alkylation of nucleosomes also increased the enzymatic release of 3-MeA as well as decreased the sedimentation coefficient. All of these experiments indicate a limited availability of 3-MeA residues to the glycosylase and suggest that some conformational change must occur in vivo for complete repair. 52 references, 6 figures, 4 tables.

32224 **Glycoprotein processing in mutants of HSV-1 that induce cell fusion.** Person, S.; Kousoulas, K.G.; Knowles, R.W.; Read, G.S.; Holland, T.C.; Keller, P.M.; Warner, S.C. (Pennsylvania State Univ., University Park). *Virology;* **117**: 293-306(1982).

The synthesis of viral-specified glycoproteins, and their appearance on cell surfaces, were compared for cells infected either with syncytial mutants of HSV-1 or with the parental strains from which the mutants were derived. The mutants MP and tsB5, representatives of two different viral genes that affect fusion, were employed in these studies. Cells infected with either mutant gave rise to reduce surface labeling of major viral-specified glycoproteins throughout infection relative to the parental strains. Putative glycoprotein precursors were synthesized in similar amounts throughout infection in mutant and wild-type infected cells. However, during a chase period after a pulse of labeling, fully glycosylated species of glycoproteins accumulated more slowly in mutant than in parent infected cells. The effect was clearly visible early in MP-infected cells and by 9 hr after infection for tsB5-infected cells, and increased thereafter. Apparently the decrease in appearance of glycoproteins on the cell surface of mutant-infected cells is due to a decrease in their rate of processing. 26 references, 7 figures.

32225 **Photokinetic aspects of specific hydrogen bonding in all-trans retinal at room temperature.** Das, P.K.; Hug, G.L. (Univ. of Notre Dame, IN). *Photochemistry and Photobiology;* **36**: 455-461(1982).

Room-temperature hydrogen-bonding of all-trans retinal (ATR) with 1,1,1,3,3,3,-hexafluoro-2-propanol (HFIP) in cyclohexane results in fluorescence enhancement and triplet yield quenching; these effects, as well as the associated absorption spectra changes in both ground and triplet states and the kinetics of H-bonding in the triplet state, have been studied by steady-state absorption-emission and laser flash-photolytic transient measurements. The fluorescence enhancement is predominantly controlled by the H-bonding in the ground state (static interaction) and gives a value of 440 m^{-1} for the corresponding equilibrium constant which is very similar to the value (420 M^{-1}) obtained from the analysis of absorption spectral data as a function of [HFIP]. The quantum yield of triplet occupation (theta/sub T/) of the H-bonded complex, ATR-HFIP, in cyclohexane is non-negligible and is about one-third of theta/sub T/ of free ATR. The kinetic data of H-bonding equilibration in the triplet state, observable on a nanosecond time scale, indicate that the triplet ATR is a stronger base than the ground state as far as H-bonding with HFIP is concerned. 28 references, 5 figures, 1 table.

32226 **NMR of ^{13}C enriched amino acids and peptides.** London, R.E. (Los Alamos National Lab., NM). *ACS Symposium Series;* No. 191, 119-155(1982).

Some of the characteristics of labeled systems are outlined, with particular emphasis on the relation of information content to labeling pattern. The spectroscopic characteristics of ^{13}C enriched amino acids are discussed by considering separately the three categories of isotopic labeling: 1) specific enrichment, usually of a single carbon position; 2) uniform enrichment with the labeling of each carbon statistically independent; and 3) general enrichment with the carbon labeling non-random. The conformational interpretation of scalar carbon-carbon coupling constants is presented. The relaxation characteristics of carbon 13 enriched amino acids are described under the following topics: 1) ^1H relaxation in ^{13}C molecules; 2) ^{13}C relaxation in multiply enriched systems; and 3) effects of short relaxation times on lineshapes and couplings. Biological studies with isotopically labeled amino acids and peptides in combination with NMR detection allows investigation of the intracellular properties of intact cells. The biological studies also include the interactions of peptides with membranes and proteins. 97 references, 12 figures, 4 tables.

32227 **Oxidation of biologically active reducing substances by ozone.** Menzel, D.B. (Battelle Pacific Northwest Lab., Richland, WA). *Archives of Environmental Health;* **23**: 149-153(Aug 1971).

Cysteine, reduced glutathione, thioglycolic acid, NADH and NADPH are readily oxidized by ozone. When glutathione is oxidized, the product is not reducible by the biological system of glutathione reductase and NADPH. NADH and NADPH are biologically active as coenzymes, however, after oxidation. Sulfhydryl enzymes, papain, and glyceraldehyde 3-phosphate dehydrogenase are also inactivated by ozone even in the presence of cysteine. The inactive form of the enzymes is only partially reactivated by cysteine. Other sulfhydryl reagents provide only partial protection of papain against ozone. Selenocysteine in combination with cysteine is a highly effective protector. These data suggest that ozone may act by oxidation of sulfhydryl compounds, and especially sulfhydryl enzymes, to higher oxidation states than the disulfide which is not reducible by the reductases available in cells. Seleno compounds may be important cellular protectors. 14 references, 5 tables.

32228 (CONF-8504121—2) **Three-dimensional reconstruction and data display of chromosome structure studied by electron microscope tomography.** Olins, D.E. (Tennessee Univ., Oak Ridge (USA). Graduate School of Biomedical Sciences; Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 11p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011562.

From Computer graphics '85; Dallas, TX, USA (14 Apr 1985).

Modern transmission electron microscopes can be employed to generate useful and informative three-dimensional reconstructions of asymmetric cell structures by adapting the principles of axial tomography and utilizing the power of digital image processing. An example of this technique, called electron microscope tomography (EMT), applied to analysis of the 3-D structure of an active eukaryotic gene in situ is presented. Future improvements in the field of EMT depend upon the development of methods for visualizing, editing and interpreting the rich image information of the 3-D reconstructions. 2 refs., 5 figs.

32229 (CONF-8503125—2) **Experimental approaches for the detection of chromosomal malsegregation occurring in the germline of mammals.** Russell, L.B. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 43p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85011908.

From Symposium on aneuploidy: etiology and mechanisms; Washington, DC, USA (25 Mar 1985).

Existing and newly proposed methods to detect the induction of heritable aneuploidy are summarized, and their favorable and unfavorable features discussed. Among the tests involving direct chromosomal examination, that involving study of pronuclear chromosome at first cleavage is judged to be the most universally informative and reliable, provided tertiary trisomy can be ruled out. Measurement of post-midterm (fetal) death is proposed as a trisomy prescreen that can be readily combined with a dominant-lethal test. Among the genetic procedures for identifying the results of malsegregation events, direct detection of aneuploids has a number of advantages over complementation methods, in which only a fraction of the products of aneuploid gametes is detectable. Direct detection of aneuploids must, however, be restricted to sex-chromosomes, if postnatal animals are examined. A genetic marker system to detect autosomal trisomies in fetuses is proposed. An examination of experimental parameters that might maximize induction of malsegregation leads to the recommendation to include preleptotene among exposed germ-cell stages. 64 refs., 3 figs., 5 tabs.

32230 **Modes of integration of heterologous plasmid** DNA **into the chromosome of Streptococcus pneumoniae.** Pozzi, G.; Guild, W.R. (Duke Univ., Durham, NC). *Journal of Bacteriology;* **161**: No. 3, 909-912(Mar 1985). Contract AS05-76EV03941.

The authors compared the efficiencies of two different processes that can direct integration of plasmids into chromosomes of recipient cells during transformation. A donor-recipient system was constructed to allow a single donor plasmid to use either flanking homology, involving an apparent double crossover, or the insertion duplication process that has been described as due to a Campbell-like single crossover between the chromosome and a circular duplex. The latter process gave 600-fold fewer insertions that did the former, confirming expectations from prior work showing that insertion of heterologous DNA by use of flanking homology is highly efficient. It has some advantages for cloning and mapping purposes and can be exploited once it is recognized.

32231 **Nodules are induced on alfalfa roots by Agrobacterium tumefaciens and Rhizobium trifolii containing small segments of the Rhizobium meliloti nodulation region.** Hirsch, A.M.; Drake, D.; Jacobs, T.W.; Long, S.R. (Wellesley College, MA). *Journal of Bacteriology;* **161**: No. 1, 223-230(Jan 1985). Contract AT03-82ER12084.

Regions of the Rhizobium meliloti nodulation genes from the symbiotic plasmid were transferred to Agrobacterium tumefaciens and Rhizobium trifolii by conjugation. The A. tumefaciens and R. trifolii trans-conjugants were unable to elicit curling of alfalfa root hairs, but were able to induce nodule development at a low frequency. These were judged to be genuine nodules on the basis of cytological and developmental criteria. Like genuine alfalfa nodules, the nodules were initiated from divisions of the inner root cortical cells. They developed a distally positioned meristem and several peripheral vascular bundles. An endodermis separated the inner tissues of the nodule from the surrounding cortex. No infection threads were found to penetrate either root hairs or the nodule cells. Bacteria were found only in intercellular spaces. Thus, alfalfa nodules induced by A. tumefaciens and R. trifolii transconjugants carrying small nodulation clones of R. meliloti were completely devoid of intracellular bacteria. When these strains were inoculated onto white clover roots, small nodule-like protrusions developed that, when examined cytologically, were found to more closely resemble roots than nodules. Although the meristem was broadened and lacked a root cap, the protrusions had a central vascular bundle and other rootlike features. The results suggest that morphogenesis of alfalfa root nodules can be uncoupled from infection thread formation. The genes encoded in the 8.7-kilobase nodulation fragment are sufficient in A. tumefaciens or R. trifolii backgrounds for nodule morphogenesis.

32232 **Differential behavior of plasmids containing chromosomal DNA insertions of various sizes during transformation and conjugation in Haemophilus influenzae.** Balganesh, M.; Setlow, J.K. (Brookhaven National Lab., Upton, NY). *Journal of Bacteriology;* **161**: No. 1, 141-146(Jan 1985).

Plasmids with chromosomal insertions were constructed by removal of a 1.1-kilobase-pair piece from the 9.8-kilobase-pair vector plasmid pDM2 by EcoRI digestion and inserting in its place various lengths of chromosomal DNA (1.7, 3.4, and 9.0 kilobase pairs) coding for resistance to novobiocin. A fourth plasmid was constructed by insertion of the largest piece of chromosomal DNA into the SmaI site of pDM2. The plasmids without inserts were taken up poorly by competent cells and thus were considered not to contain specific DNA uptake sites. The presence of even the smallest insert of chromosomal DNA caused a large increase in transformation of Rec^+ and Rec^- strains. The frequency of plasmid establishment in Rec^+ cells by transformation increased exponentially with increasing insert size, but in Rec^- cells there was less transformation by the larger plasmids. Conjugal transfer of these plasmids was carried out with the 35-kilobase-pair mobilizing plasmid pHD147. The frequency of establishment of plasmids by this method not only was not markedly affected by the presence of the insertions, but also decreased somewhat with increase in insert size and was independent of rec-1 and rec-2 genes. Recombination between plasmid and chromosome was readily detected after transformation, but could not be detected after transconjugation even when the recipient cells were Rec^+ and made competent. These data suggested that there is a special processing of plasmid DNA that enters the competent cells in transformation that makes possible recombination of homologous regions of the plasmid with the chromosome and pairing with the chromosome that aids plasmid establishment.

32233 **Analysis of the hematopoietic effects of new dominant spotting (W) mutations of the mouse. I. Influence upon hematopoietic stem cells.** Geissler, E.N.; Russell, E.S. (Jackson Lab., Bar Harbor, ME). *Experimental Hematology (Copenhagen);* **11**: No. 6, 452-460(Jul 1983).

Mice carrying two mutants W alleles usually have severe macrocytic anemias which result from deficiencies of hematopoietic stem cells (CFUs). Anemic W^{39}/W^{39} and W^{41}/W^{41} homozygotes have deficiencies in the numbers of femoral stem cells which correspond to the severities of their anemias. The non-anemic W^{44}/W^{44} homozygote has as few stem cells as the W^{41}/W^{41} mouse. Nevertheless, bone marrow implants from W^{44}/W^{44} donors cure the anemias of W/W/sup v/ recipients while implants from anemic W^{39}/W^{39} and W^{41}/W^{41} donors do not. The peripheral hematologic differences between W^{41}/W^{41} and W^{44}/W^{44} homozygotes probably arise from qualitative differences intrinsic to their stem cells rather than from extrinsic hematopoietic factors. The hematopoietic environments of all three W homozygotes are relatively normal in that they support normal erythropoiesis when injected with congenic +/+ marrow. Even non-anemic W^{44}/W^{44} recipients are repopulated with +/+ donor red cells, indicating that W^{44}/W^{44} stem cells are at a disadvantage when completing with normal counterparts. 14 references, 6 figures, 2 tables.

32234 **Numerical methods for inferring evolutionary trees.** Felsenstein, J. (Univ. of Washington, Seattle). *Quarterly Review of Biology;* **57**: No. 4, 379-404(Dec 1982). Contract AT06-70EV71005;AM06-70RL02225.

Despite a century of evolutionary theory, only in the last few decades have clearly defined procedures for inferring phylogenies been stated. For discrete characters whose ancestral states are known, the prescriptions of Hennig are well defined, but they are applicable only when there is no incompatibility between different characters. This limitation has led to the elaboration of a number of methods for dealing with such incompatibilities. Each method has a different set of implicit assumptions concerning the biology of the characters and the information available from the data. If the methods are considered in a statistical framework as different estimators of an unknown quantity (the phylogeny), these assumptions are more clearly seen. Standard statistical approaches, such as maximum likelihood, can be used to obtain methods whose properties are known and for which one can determine the amount of uncertainty in the resulting estimates of the phylogeny. Although existing statistical models are highly oversimplified and do not reflect the complexity of evolutionary processes, it is by viewing the problem as a statistical one that we can place all these methods in a common framework, within which their behavior and assumptions can be compared. 160 references, 3 figures.

32235 **How can we infer geography and history from gene frequencies.** Felsenstein, J. (Univ. of Washington, Seattle). *Journal of Theoretical Biology;* **96**: 9-20(1982). Contract AT06-70EV71005.

In principle, patterns of migration and historical branching events can be reconstructed from gene frequency data, but we still lack most of the techniques necessary to do this. This is a fairly clearly defined problem with a variety of interesting subcases. It appears likely to raise interesting mathematical and statistical questions. The amount of data potentially available is very large. The problem is reviewed, but no new solutions are proposed. 26 references, 3 figures.

32236 **(PEL-R—819) Use of the short-lived radioisotopes ^{11}C and ^{13}N to study nitrogen uptake and photosynthate translocation in fodder beet.** McNaughton, G.S.; Minchin, P.E.H. (Department of Scientific and Industrial Research, Lower Hutt (New Zealand). Physics and Engineering Lab.). 1983. 24p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701472.

Following discussions at the Nitrogen Balance Workshop held at Massey University, May 1980, on the use of the 10 min half-life isotope nitrogen-13, it was decided to carry out collaborative experiments with Dr K.M. Goh from Lincoln College. These were concerned with the mechanism of the effect of sodium chloride on the uptake of nitrate and ammonium ions by beet (Beta vulgaris L) plants. In this report we firstly summarize briefly some of the relevant literature then report on the experiments carried out to November 1982. The initial experiments used nitrogen-13 to investigate, with hydroponically grown plants, the effect of sodium chloride on the uptake by roots, and the transport to leaves, of nitrogen-13 applied to the roots as nitrate or as ammonium ions. After failing to find any response to NaCl in these experiments, it was decided to determine whether there was any effect of NaCl on the transport of carbon-11 labelled photosynthates from the leaves. Production of this preliminary report is a first step to assessing the next phase, if any of this investigation.

The N retention test with 20 mg^{15}N/kg body weight was applied to 18 children with nanism of different origin and treated with growth hormone. The parameters of renal cumulative excretion and of protein synthesis rate were determined and analyzed by a 3-pool-model.

32256 **Effects of high humidity on translocation of foliar-applied labeled compounds in plants. II. Translocation from starved leaves.** Clor, M.A.; Crafts, A.S.; Yamaguchi, S. (Univ. of California, Davis). *Plant Physiology;* **38**: 501-507(1963).

Absorption and translocation of chemicals by cotton leaves are greatly increased under conditions of high humidity. This enhanced movement consists of increased phloem transport and induced uptake into and transport via the xylem. Studies with starved and normal leaves prove that phloem transport is greatly reduced in leaves depleted of carbohydrate reserves; starvation has no effect upon the xylem transport induced by high humidity. The relation of high humidity to herbicide usage is discussed. 15 references, 6 figures.

From DOE single-photon ultrashort-lived radionuclides conference; Washington, DC, USA (9 May 1983).

DOE symposium series, 57.

The purpose was to define the current role and state-of-the-art regarding the development, clinical applications, and usefulness of generator-produced single-photon ultrashort-lived radionuclides (SPUSLR's) and to predict their future impact on medicine. Special emphasis was placed on the generator production of iridium-191, gold-195, and krypton-81. This report contains expanded summaries of the included papers. (ACR)

32258 (DOE/ER/60084—T2) **Current status of the Os-191 → Ir-191m generator.** Packard, A.B.; O'Brien, G.M.; Treves, S. (Children's Hospital Corp., Boston, MA (USA)). 1985. Contract AC02-82ER60084. 20p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85008306.

The advantages of ultrashort-lived radionuclides for angiography have been well documented in recent years. Although several isotopes are potentially useful in this application (e.g., Au-195m, Ag-109m, Ir-191m), Ir-191m offers several advantages. Among these advantages are a parent isotope (Os-191) with a sufficiently long half-life (15.4 d) to allow production of a generator with a reasonable shelf-life, high photon yield (129 keV, 26%; 66 keV, 55%), and ease of production of the parent isotope (i.e., neutron irradiation of Os-190). Ir-191m has not, however, been widely used for radionuclide angiocardiography because of a less than optimal generator design and the assumption that the half-life of Ir-191m (4.96 s) was too short to permit visualization of the left ventricle in adult patients. Recently we have, however, been able to develop a generator with higher Ir-191m yield (25 to 30%/ml), lower Os-191 breakthrough ($< 5 \times 10^{-4}\%$) that is easier to assemble. In addition, the eluate of this new generator (0.001M oxalic acid/0.9% saline) does not require buffering prior to injection. We have also demonstrated that adequate studies of the left ventricle can be obtained in adults when sufficient quantities of isotope are injected. 16 refs., 2 figs., 2 tabs.

32263 (IAEA-TECDOC—317) **Quality control of nuclear medicine instruments.** (International Atomic Energy Agency, Vienna (Austria)). Nov 1984. 211p. NTIS (US Sales Only), PC A10/MF A01. File Number DE85701252.

This document, which gives detailed guidance on the quality control of the various electronic instruments used for radiation detection and measurement in nuclear medicine, stems from the work of two Advisory Groups convened by the International Atomic Energy Agency (IAEA). A preliminary document, including recommended test schedules but lacking actual protocols for the tests, was drawn up by the first of these groups, meeting at the IAEA Headquarters in Vienna in 1979. A revised and extended version, incorporating recommended test protocols, was prepared by the second Group, meeting likewise in Vienna in 1982. This version is the model for the present text. The document should be of value to all nuclear medicine units, and especially to those in developing countries, in the initiation or revision of schemes for the quality control of their instruments. Its recommendations have provided the basis for instruction in two IAEA regional technical co-operation projects in the subject field, one initiated in 1981 for countries of Latin America and one initiated in 1982 for countries of Asia and the Pacific.

Short note.

In Annual report June 1984. [Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Center].

32270 (NRL—1983/5) **Perceptibility of variations in total x-ray beam filtration as evidenced on radiographs. An exploratory study.** Williamson, B.D.P. (National Radiation Lab., Christchurch (New Zealand)). 1983. 19p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701478.

The use of filtration in the primary x-ray beam has long been a standard procedure in controlling radiation doses to patients in diagnostic radiology, particularly surface doses. For lightly filtered beams, the addition of further filtration effectively removes softer beam components which otherwise would be absorbed within the patient. The amount and quality of radiation reaching the film is changed only slightly. Thus the first increments of filtration added to diagnostic x-ray beams require little or no change in exposure factors. With further filtration, however, the penetration of the beam increases and a greater proportion is transmitted through the patient to the film. The image contrast is reduced. Simultaneously the useful beam intensity is reduced to the extent that compensating mAs increases begin to be required to maintain constant optical density in the radiograph. When these compensatory adjustments are made it is possible to examine the relationship between total filtration and its effects on radiographic appearance, which should be seen as variations in contrast or penetration. This report is of an exploratory study of the perceptibility to radiographers of these changes in radiographic appearance caused by variations in x-ray beam filtration.

32271 (NRPB-R—164) **Development and operation of a method for the remote determination of X-ray beam parameters used in dental radiography.** Hewitt, J.M. (National Radiological Protection Board, Chilton (UK)). Jul 1984. 17p. HMSO, London, price Pound 4.00.

The method described is a part of the Dental Monitoring Service operated by the Board in the UK for the assessment of radiation protection in dental practice. This postal service, which provides a comprehensive survey of dental X-ray sets and radiographic procedures, is undertaken by means of a questionnaire, film cassettes for exposure to the X-ray set and a personal monitoring component to check operator doses. The film cassettes and the methods by which the X-ray beam parameters are obtained are described in detail. The cassettes use radiation monitoring film to realise, by means of measurements of relative transmission through selected copper filters, the extended dynamic range of exposure necessary for accurate indication of the operating kilovoltage and total beam filtration. The standard of the X-ray unit with regard to the relevant regulations and code of practice can then be assessed, and, from the values of radiation dose determined for chosen exposure times, exposure settings for optimum quality radiographs can be recommended where appropriate. Although designed primarily for dental X-ray units, use of the film cassette package may be extended, with suitable calibration, to general diagnostic X-ray survey measurements.

32272 (NRPB-R—165) **Quality assurance tests of the NRPB dental monitoring cassette.** Iles, W.J.; McClure, D.R.; Muirhead, C.R. (Rutherford Appleton Lab., Chilton (UK)). Jul 1984. 25p. HMSO, London, price Pound 4.00.

This report describes the tests designed to assess the performance of the NRPB dental monitoring cassette; it complements NRPB-R164. Measurements have been made for both the original and new cassettes with film manufactured by Kodak Ltd and Agfa-Gevaert Ltd. The performance parameters investigated were the ability to measure the X-ray tube potential, the filtration of the X-ray beam, the exposure given to the cassette, and the diameter of the beam. The consistency between different cassette inserts was also assessed. The values given by the processing laboratory and the values from the irradiating laboratory are presented, and the results are then analysed statistically to determine the influence of the various parameters on the assessment of individual parameters. The performance of the cassette was found to be satisfactory.

32273 (NUREG/CR—4131) **Investigation of alternative means to accomplish the goals of biennial calibration of ionization chambers.** Cameron, J.R.; DeWerd, L.A.; Goetsch, S.J.; Price, J.C. (Wisconsin Univ., Madison (USA). Dept. of Medical Physics). May 1985. 38p. NTIS, PC A03/MF A01 - GPO. File Number TI85901477.

The research described in this report was performed to investigate the feasibility of a mailed dosimetry system as an alternative method of achieving the goals of the present US Nuclear Regulatory Commission requirement that ionization chambers used for calibration of cobalt-60 teletherapy units be calibrated every two years. Both thermoluminescent dosimeters (TLD's) and diode detector units were used in this study. A total of 20 hospitals in the states of Illinois, Iowa and Wisconsin participated in a program in which this dosimetry package was sent to each institution on three separate occasions. The physicist, physician or chief technologist was asked to deliver 1.50 Gray (150 rads) to the device, assuming the device was equivalent in radiation absorption characteristics to human tissue. A treatment field size of 10cm by 10cm was chosen and the institution was requested to use their clinical source-to-surface distance. The accuracy of the beam localization as indicated by the coincidence of the light field with the radiation field was measured as well. The criterion for accuracy of dose delivery was +-5% and the criterion for light field and radiation field coincidence was +-3.0mm. Only two hospitals during the course of the study had both unacceptable diode meter and TLD readings simultaneously. Only one hospital had a disagreement of more than 3mm between the light field and the radiation field. It is recommended that such a mailed dosimetry package be considered as an alternative to the present NRC requirement for biennial calibration of ionization chambers used to calibrate cobalt-60 teletherapy sources. 5 refs., 5 tabs.

32274 (ZfI-Mitt—77, pp 78-83) **^{15}N isotopic analysis in biological materials using the ^{15}N analyzer NOI-6.** Jung, K.; Reinhardt, R.; Meier, G. (Akademie der Wissenschaften der DDR, Leipzig. Zentralinstitut fuer Isotopen- und Strahlenforschung). Sep 1983. (In German). NTIS (US Sales Only), PC A14/MF A01. File Number DE85780083. (CONF-8305218—Summ.).

From Recent results of /sup 15/N tracer technique in medicine symposium; Rostock, German D.R. (29 May 1983).

Construction and operation of the ^{15}N analyzer NOI-6 are described. In the blood of test persons and patients suffering from a liver disease the content of ammonia was determined by isotopic analysis after adding of $^{15}NH_4Cl$ to the blood.

32275 (ZfI-Mitt—77, pp 229-236) **Evaluation of the protein metabolism in patients suffering from liver cirrhosis and portal hypertension before and after shunt operations. Studies with ^{15}N-glycin.** Gehrandt, F. (Kreiskrankenhaus Pritzwalk (German Democratic Republic)); Czarnetzki, H.D. (Rostock Univ. (German Democratic Republic). Bereich Medizin); Schenker, U. (Karl-Marx-Universitaet, Leipzig (German Democratic Republic). Chirurgische Klinik); Faust, H.; Junghans, P. (Akademie der Wissenschaften der DDR, Leipzig. Zentralinstitut fuer Isotopen- und Strahlenforschung). Sep 1983. (In German). NTIS (US Sales Only), PC A14/MF A01. File Number DE85780083. (CONF-8305218—Summ.).

From Recent results of /sup 15/N tracer technique in medicine symposium; Rostock, German D.R. (29 May 1983).

The ^{15}N tracer technique is a valuable means in determining the protein metabolism of the liver in cirrhotic patients with portal hypertension. The portions of urea-N, ammonia-N, and other ^{15}N-metabolites in total urinary ^{15}N excretion were determined. Thus, the ^{15}N tracer technique is suited to help in selection and indication of surgical treatment.

32276 (ZfI-Mitt—77, pp 254-259) **Improvement of differential diagnostics in pseudohermaphroditismus masculinus by means of ^{15}N-labelled amino acids. Methodical aspects.** Willgerodt, H.; Hoepffner, W.; Keller, E. (Karl-Marx-Universitaet, Leipzig (German Democratic Republic). Bereich Medizin); Reinhardt, R.; Junghans, P. (Akademie der Wissenschaften der DDR, Leipzig. Zentralinstitut fuer Isotopen- und Strahlenforschung). Sep 1983. (In German). NTIS (US Sales Only), PC A14/MF A01. File Number DE85780083. (CONF-8305218—Summ.).

From Recent results of /sup 15/N tracer technique in medicine symposium; Rostock, German D.R. (29 May 1983).

In 7 children with male hermaphroditism the N retention test was performed using ^{15}N-glycine (13.5 mg/kg body weight). On testosterone therapy the protein synthesis rate increased significantly while there was a significant decrease in the cumulative ^{15}N excretion.

32277 (ZfI-Mitt—77, pp 274-279) **Determination of residual volume and intrapulmonal mixing ratio of gases by means of ^{15}N.** Reinhardt, R.; Faust, H. (Akademie der Wissenschaften der DDR, Leipzig. Zentralinstitut fuer Isotopen- und Strahlenforschung); Schauer, J. (Karl-Marx-Universitaet, Leipzig (German Democratic Republic). Bereich Medizin). Sep 1983. (In German). NTIS (US Sales Only), PC A14/MF A01. File Number DE85780083. (CONF-8305218—Summ.).

From Recent results of /sup 15/N tracer technique in medicine symposium; Rostock, German D.R. (29 May 1983).

In healthy controls and in patients suffering from chronic bronchitis with emphysema the residual volume of the lungs and the intrapulmonal mixing ratio of the respiratory gases were determined using ^{15}N as tracer.

32278 **Requirements for a treatment planning system for radioimmunotherapy.** DeNardo, G.L.; Raventos, A.; Hines, H.H.; Scheibe, P.O.; Macey, D.J.; Hays, M.T.; DeNardo, S.J. (Univ. of California, Sacramento). *International Journal of Radiation Oncology, Biology and Physics;* **11**: No. 2, 335-348(Feb 1985). Contract AT03-82ER60056.

Cancer-seeking antibodies carrying radionuclides can, in theory, be very powerful agents for the radiotherapy of cancer. However, as with all radiotherapy, the undesired dose to critical normal organs is the limiting factor that determines success or failure. The distribution of radiation dose in cancer and noncancer tissue is highly dependent on choices the therapist can make: choices of the antigens to be targeted, choices of the antibodies or antibody fragments to be used, choices of radionuclides, of amounts, of timing, and other electives. New technologies, especially of monoclonal antibody production, make the options myriad. Optimization of this therapy depends on a foreknowledge of the radiation dose distributions to be expected. The necessary data can be acquired by established tracer techniques, in individual patients, for particular treatment selections. These tracer techniques can now be implemented by advanced equipment for quantitative, tomographic radionuclide imaging and strengthened by dynamic modeling of the physiological parameters which govern radionuclide distribution, and hence radiation dose distribution.

32279 **Human primary visual cortex topography imaged via positron tomography.** Schwartz, E.L. (New York University Medical Center, NY (USA). Dept. of Psychiatry); Christman, D.R.; Wolf, A.P. (Brookhaven National Lab., NY (USA). Dept. of Chemistry). *Brain Research;* **294**: No. 2, 225-230(5 Mar 1984).

The visuotopic structure of primary visual cortex was studied in a group of 7 human volunteers using positron emission transaxial tomography (PETT) and ^{18}F-labeled 2-deoxy-2-fluoro-D-glucose ([^{18}F]DG). A computer animation was constructed with a spatial structure which was matched to estimates of human cortical magnification factor and to striate cortex stimulus preferences. A lateralized cortical 'checker-board' pattern of [^{18}F]DG was stimulated in primary visual cortex by having subjects view this computer animation following i.v. injection of [^{18}F]DG. The spatial structure of the stimulus was designed to produce an easily recognizable 'signature' in a series of 9 serial PETT scans obtained from each of a group of 7 volunteers. The predicted lateralized topographic 'signature' was observed in 6 of 7 subjects. Applications of this method for further PETT studies of human visual cortex are discussed.

32280 **(CBPF-NF—022/83) Electron microscopy and ultrastructure of a magnetotactic microorganism.** Farina, M.; Barros, H.G.deP.L. de; Esquivel, D.M.S.; Danon, J. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 9p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701468.

Transmission and scanning electron microscopy of magnetotactic microorganisms with diameter in the order of 6 μm show a complex internal structure indicating that they are a colony or aggregate of similar cells, with a large number of high density regions responsable for the observed magnetotaxis.

32281 **Competition among rhizobium species for nodulation of Leucaena leucocephala in two tropical soils.** Moawad, H.; Bohlool, B.B. (Univ. of Hawaii, Honolulu). *Applied and Environmental Microbiology;* **48**: No. 1, 5-9(Jul 1984).

The successful nodulation of legumes by a Rhizobium strain is determined by the competitve ability of that strain against the mixture of other native and inoculant rhizobia. Competition among six Leucaena rhizobial strains in single and multistrain inoculants were studied. Field inoculation trials were conducted in an oxisol and a mollisol soil, both of which contained indigenous Leucaena-nodulating rhizobia. Strain-specific fluorescent antibodies were used for the identification of the strains in Leucaena nodules. Mixtures of three recommended inoculum strains for Leucaena species (TAL82, TAL582, and TAL1145) were used in peat-based inocula either alone or with one of the three other strains isolated from the sites, B213, B214, and B215. Each of these latter three strains was also used as single-strain inocula to study their competition with the native rhizobia in the two soil systems. In the oxisol soil, strains B213 and B215, when used as single-strain inocula, outcompeted the native rhizobia and formed 92 and 62% of the nodules, respectively. Strain B214 was the least competitive in oxisol soil, where it formed 30% of the nodules, and the best in mollisol soil, where it formed 70% of the nodules. The most successful competitor for nodulation in multistrain inocula was strain TAL1145, which outcompeted native and other inoculum Leucaena rhizobia is both soils. None of the strains in single or multistrain inoculants was capable of completely overcoming the resident rhizobia, which formed 4 to 70% of the total nodules in oxisol soil and 12 to 72% in mollisol soil. No strong relationship was detected between the size of the rhizosphere population of a strain and its successful occupation of nodules. 24 references.

5509 Pathology

32282 (DOE/BP—223, pp 1-22) **Status of viral fish diseases in the Columbia River Basin.** Groberg, W.J. Jr. (Oregon State Univ., Corvallis). Apr 1983. NTIS, PC A09/MF A01. File Number DE85008089. (CONF-8210332—).

From Workshop on viral diseases of salmonid fishes in the Columbia River Basin; Portland, OR, USA (7 Oct 1982).

Recently, there have been reports of widespread viruses among salmonid fishes in the Columbia River Basin, as well as in hatcheries. A recent report indicates that mortalities to infectious hematopoietic necrosis in 1982 have average 30% in juveniles and have reached as high as 70% at certain facilities. Several hypotheses are outlined concerning the possible mechanism whereby infectious hematopoietic necrosis has suddenly assumed catastrophic proportions in salmonids of the basin.

32283 (DOE/BP—223, pp 23-50) **Methods for diagnosing IHNV infection in fish.** Leong, J.C.; Hsu, Y.L.; Engelking, H.M.; Fendrick, J.L.; Durrin, L.K.; Kurath, G. (Oregon State Univ., Corvallis). Apr 1983. NTIS, PC A09/MF A01. File Number DE85008089. (CONF-8210332—).

From Workshop on viral diseases of salmonid fishes in the Columbia River Basin; Portland, OR, USA (7 Oct 1982).

The effective management of fish health in hatcheries requires the use of rapid, accurate, and sensitive methods for diagnosing disease. Early diagnosis can result in the control of the disease with a decrease in mortality and a halt to the further spread of the infectious agent. Current methods used in viral diagnoses are reviewed. Some ways by which these methods may be used for infectious hematopoietic necrosis virus are discussed. 10 references, 11 figures, 2 tables.

32284 (DOE/BP—223, pp 51-75) **Control of mortality caused by infectious hematopoietic necrosis virus.** Mulcahy, D. (Fish and Wildlife Service, Seattle, WA). Apr 1983. NTIS, PC A09/MF A01. File Number DE85008089. (CONF-8210332—).

From Workshop on viral diseases of salmonid fishes in the Columbia River Basin; Portland, OR, USA (7 Oct 1982).

Fish mortality caused by infectious hematopoietic necrosis (IHN) virus can be prevented by following two basic principles: never use eggs taken from infected broodstock and never raise fish in a water supply contaminated with IHN virus. However, viruses remaining in the culture facility must be removed before these principles can be successfully applied. Methods of controlling these viral diseases include extermination, quarantine, and vaccines. Also, mortality can be controlled by the use of elevated water temperature and by limiting the distribution of the disease by programming stock inspections and surveillance. There is a need to avoid using IHN virus carrier female fish, as well as male fish, by broodstock culling. 5 figures, 1 table.

32285 (DOE/BP—223, pp 76-83) **Acquisition and transfer of fish health data.** Amos, K.H. (Washington Dept. of Fisheries, Olympia). Apr 1983. NTIS, PC A09/MF A01. File Number DE85008089. (CONF-8210332—).

From Workshop on viral diseases of salmonid fishes in the Columbia River Basin; Portland, OR, USA (7 Oct 1982).

Viral diseases pose a tremendous threat to salmonid hatcheries on the Columbia River. Currently, there is a need for a program to acquisition, compile, and analyze relevant data in determining the epidemiology of these diseases. It is necessary to know the location, the virulence of the disease, the incidence, and the potential for the disease to spread. Once the viral histories of all Columbia Basin hatcheries and stocks are available, this multi-faceted tool will help to control viral diseases.

32286 (DOE/BP—223, pp 84-118) **Viral disease considerations in the commercial trout industry in Idaho.** Busch, R.A. (Clear Springs Trout Co., Buhl, ID). Apr 1983. NTIS, PC A09/MF A01. File Number DE85008089. (CONF-8210332—).

From Workshop on viral diseases of salmonid fishes in the Columbia River Basin; Portland, OR, USA (7 Oct 1982).

Fish health management of the commercial trout industry in Idaho is discussed with emphasis on virus disease control. Some important and basic differences in Idaho hatcheries are compared to hatcheries elsewhere in the Columbia River Basin. Two basic differences are a constant, year-round water temperature of 14.5°C and continuous hatchery production 12 months out of every year. These factors become critical in discussing practical and cost effective methods of viral disease control in commercial trout hatcheries. There is a great deal of movement of fish stocks, providing opportunities for the spread of the diseases. The initial appearance of infectious hematopoietic necrosis (IHN) virus began as a chronic infection of large fish in 1977 and 1978 in the Hagerman Valley. Subsequent years show infection beginning in progressively smaller fish and becoming more acute.

32287 (DOE/BP—223, pp 119-139) **Current fish disease control policies affecting the Columbia River Basin.** Rohovec, J.S. (Oregon State Univ., Corvallis). Apr 1983. NTIS, PC A09/MF A01. File Number DE85008089. (CONF-8210332—).

From Workshop on viral diseases of salmonid fishes in the Columbia River Basin; Portland, OR, USA (7 Oct 1982).

There is presently no comprehensive fish disease control policy which has been adopted and is in effect in the Columbia River Basin. However, the United States government initiated fish disease control legislation in 1958. The Title 50 law involves the entire nation but is limited in scope since it concerns regulation and control of only two specific fish pathogens. Fish disease control policies, which have been enacted by the state governments of the Colorado River drainage and the Great Lakes Fishery Commission are presented. Most individual state and federal agencies operating in the Columbia River Basin have fish disease control guidelines which they follow. The policies of Washington, Oregon, Canada and the US Fish and Wildlife Service are discussed. 4 references, 1 table.

32288 (DOE/BP—223, pp 140-150) **Proposed viral disease control policies for the Columbia River Basin.** Wold, E. (National Marine Fisheries Service, Portland, OR). Apr 1983. NTIS, PC A09/MF A01. File Number DE85008089. (CONF-8210332—).

From Workshop on viral diseases of salmonid fishes in the Columbia River Basin; Portland, OR, USA (7 Oct 1982).

Recommendations are presented for the control of virus diseases in anadromous fish for long term comprehensive plans and short term crisis control. These plans include identifying infected stocks, eliminating infected individuals from stocks, preventing the artificial movement of infected stocks, controlling water supplies and hatchery management practices to reduce horizontal modes of infection and establishing a network of information exchange.

32289 (DOE/BP—223, pp 151-158) **Fish disease research: BPA funding guidelines.** Barila, T.Y. (Bonneville Power Administration, Portland, OR). Apr 1983. NTIS, PC A09/MF A01. File Number DE85008089. (CONF-8210332—).

From Workshop on viral diseases of salmonid fishes in the Columbia River Basin; Portland, OR, USA (7 Oct 1982).

In 1980 Congress passed the Pacific Northwest Electric Power Planning and Conservation Act (Regional Act). This Act gave authority to Bonneville Power Administration of Portland, Oregon, to protect, mitigate, and enhance fish and wildlife resources affected by the development and operation of hydroelectric projects on the Columbia River and its tributaries. Under the mandate of Section 4(h) of the Regional Act, the Northwest Power Planning Council (Council) was to develop a Fish and Wildlife Program. Bonneville Power Administration's role is to be used to implement measures that are consistent with the Council's Fish and Wildlife Program. One major objective, which is presented in detail, concerns improving artificial production technology because hatcheries are a crucial link in the restoration of the Columbia River fishery. The evaluation criteria which Bonneville Power Administration has developed to assist in the selection of proposals for funding support are discussed.

32290 (DOE/BP—223, pp 159-173) **Priority research needs concerning fish viruses prevalent among Columbia River basin salmonids.** Groberg, W.J. Jr. (Oregon State Univ., Corvallis). Apr 1983. NTIS, PC A09/MF A01. File Number DE85008089. (CONF-8210332—).

From Workshop on viral diseases of salmonid fishes in the Columbia River Basin; Portland, OR, USA (7 Oct 1982).

The research needs concerning the viruses of fish in the Columbia River Basin are outlined and the rationale behind this outline is described. These needs include: epidemiology of infectious hematopoietic necrosis virus and infectious pancreatic necrosis virus; pathogenesis of infectious menatopoietic necrosis; methods for control of infectious hematopoietic necrosis; and develop a rapid diagnostic method for detection of infectious pancreatic necrosis virus in asymptomatic fish. The research, tests and investigations outlined represented those immediate needs for the Columbia River Basin agreed upon by a consensus of fish pathologists from every governmental agency responsible for fish propagation in Idaho, Washington and Oregon.

32293 (PNL-SA—9230-Rev.) Burning and clipping effects on bluebunch wheatgrass productivity. Revision. McShane, M.C.; Sauer, R.H. (Pacific Northwest Labs., Richland, WA (USA)). Feb 1983. Contract AC06-76RL01830. 16p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012982.

This study compared the response of bluebunch wheatgrass (Agropyron spicatum (Pursh) Scribner and Smith) to the removal of standing dead grass by burning and by clipping. Dormant plants were either clipped or burned in September, individually, or as part of a 3.14 m^2 area centered on the study plant. This treatment design allowed determination of the effect of competition on productivity. Clipping and burning of dormant bluebunch wheatgrass clumps significantly shortened leaf length. Biomass and the formation of seedheads were significantly reduced by clipping but not by burning. The lack of measurable effects between plants treated alone and as part of a surrounding treated area suggests that competition from nearby individuals had an insignificant role in regulating bluebunch wheatgrass productivity in the first season after treatment. 13 refs., 1 fig., 1 tab.

32294 (AECL—8061) Effects of ionizing radiation and review of the Young-Woollard document. Marko, A.M.; Myers, D.K. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Apr 1983. 16p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701469.

A review of a document entitled 'The Health Dangers of Uranium Mining and Jurisdictional Questions' has been prepared. E.R. Young and R.F. Woollard submitted, in 1980, this document to the British Columbia Royal Commission of Inquiry, Health and Environmental Protection - Uranium Mining (INIS-mf--7757). When we reviewed the document it became clear that the views concerning effects of low-level radiation including alpha irradiation do not have scientific consensus. For this reason we have included a brief summary of conclusions produced by various international and national bodies on the effects of radiation on humans.

32295 (AECL—8183) Updated follow-up of long-term Chalk River employees. Werner, M.M.; Myers, D.K.; Morrison, D.P. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Aug 1983. 23p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701475.

Data on the follow-up of CRNL employees who died during employment or after retirement have been updated to 1982 December 31. Updated tables on mortality for AECL participants in the 1953 NRX clean-up and in the 1958 NRU decontamination are also included in this report. Preliminary mortality data on two other groups are presented here for (a) female employees of CRNL, 1966-1982 and (b) male employees of CRNL who have accumulated lifetime occupational doses of 0.2 Sv (20 rem) or more. Data on types of fatal cancer recorded for long-term male CRNL employees over the period 1966-1982 are also given. No statistically significant increases in cancer deaths were found in any of the groups analyzed.

32296 (DOE/ER/60169—T2) Delayed immunologic effects of low dose radiation in Japanese A-bomb survivors. Technical progress report. Makinodan, Takashi. (California Univ., Los Angeles (USA)). 1985. Contract AT03-83ER60169. 6p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011703.

Samples collected from 832 A-bomb survivors were analyzed for natural killer activity, interleukin production, interferon production, serum interferon levels, and circulating immune complex levels. The most striking finding was a significant radiation-sex interaction for NK activity. The NK of females exposed to 100+ rads was decreased compared to those exposed to 0 to 99 rads. A significant increase in NK activity with age ATB was observed, as well as an increase with age in circulating immune complex. (ACR)

32297 (DOE/PE—0072) Radiation exposures for DOE and DOE contractor employees - 1983. Sixteenth annual report. (Pacific Northwest Labs., Richland, WA (USA)). Oct 1984. Contract AC06-76RL01830. 61p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85013023.

A total of 88,283 DOE and DOE contractor employees were monitored for whole-body ionizing radiation exposures in 1983. This represents 56.6% of all DOE and DOE contractor employees and is an increase from the number of individuals monitored in 1982. In addition to the employees, 84,851 visitors were monitored. Of all employees monitored, 56.5% received a dose equivalent that was less than measurable, 41.6% a measurable exposure less than 1 rem, and 1.9% an exposure greater than 1 rem. The exposure received by 94.6% of the visitors to DOE facilities was less than measurable. Only 5.4% of the visitors received a measurable exposure less than 1 rem, and <0.01% of the visitors received an exposure greater than 1 rem. No employees or visitors received a dose equivalent greater than 5 rem. The collective dose equivalent for DOE and DOE contractor employees was 7858 person-rem. The collective dose equivalent for visitors was 300 person-rem. The average dose equivalent for all individuals monitored was 47 mrem and the average dose equivalent for all individuals who received a measurable exposure was 190 mrem. The highest average dose equivalent for all monitored employees was observed at fuel fabrication facilities (235 mrem) and the lowest among visitors (4 mrem) to DOE facilities. These averages are significantly less than the DOE 5-rem/y radiation protection standard for whole-body exposures. Five cases of internal depositions were reported in 1983. In all cases, the depositions were less than the annual dose-equivalent standard. Internal depositions were the result of accidental, not planned, exposures. A total of 7449 monitored employees terminated their employment in 1983. The average cumulative dose equivalent for terminated employees who worked one to two years was 0.33 rem; two to four years, 0.30 rem; four to six years, 0.41 rem; and longer than six years, 3.70 rem. 5 figs., 10 tabs.

32298 (GSF-S—1063) 1983 statistical results of the Official Personal Dosimetry Service. Drexler, G.; Eckerl, H.; Haid, G.; Scheibe, D. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.). Auswertungsstelle fuer Strahlendosimeter). Jul 1984. 41p. (In German). NTIS (US Sales Only), PC A03/MF A01. File Number DE85751648.

The report consists of a summary of relevant statistical data from the official personal dosimetry in 1983. Under survey were occupationally exposed persons in the states of Bavaria, Hessen and Schleswig-Holstein. The data are based on the survey of nearly 6,400 institutions with nearly 70,000 persons and are derived from approx. 840,000 single measurements. The report covers informations on the institutions, on the persons as well as dosimetric values. The measuring method is described briefly with respect to dosimeters used, their range and the interpretation of values. Information on notional doses and the interpolation of values nearby the detection limits are given.

From Advisory group meeting on quality assurance in biomedical neutron activation analysis; Vienna, Austria (13 Sep 1982).

Trace element research at lower concentration levels imposes strict requirements on its practitioners. The analyses must be carried out under rigorously controlled conditions to protect the sample from artefacts due to the containers, the reagents and the ambient air. Essential guidelines covering general aspects of solid and liquid biomedical samples, specimen preservation and storage, sample handling tools, cleaning procedures for laboratory wares and practical steps in sample treatment such as washing procedures, drying, ashing, homogenization and some aspects of the analytical aliquot, are presented. It is stressed that no programme of low-level trace element analyses work should be started before adequate procedures for control of contamination have been developed. The implications of many intriguing factors and the steps necessary for their control involve the competence of several disciplines, thus making team work an essential component of biomedical trace element research.

32309 (INFO—0081) **Risk estimates for the health effects of alpha radiation.** Thomas, D.C.; McNeill, K.G. (Atomic Energy Control Board, Ottawa, Ontario (Canada)). Sep 1981. 335p. NTIS (US Sales Only), PC A15/MF A01. File Number DE85701050.

This report provides risk estimates for various health effects of alpha radiation. Human and animal data have been used to characterize the shapes of dose-response relations and the effects of various modifying factors, but quantitative risk estimates are based solely on human data: for lung cancer, on miners in the Colorado plateau, Czechoslovakia, Sweden, Ontario and Newfoundland; for bone and head cancers, on radium dial painters and radium-injected patients. Slopes of dose-response relations for lung cancer show a tendency to decrease with increasing dose. Linear extrapolation is unlikely to underestimate the excess risk at low doses by more than a factor of 1.5.

32310 (INFO—0093) **Field measurements of mixed exposure of operators to radioactive aerosol, gas and quartz in confinement of mining equipment cabs during open-pit mining of high-grade uranium ores.** Yoshida, K.; Atiemo, M.A.; Markham, J.W. (Atomic Energy Control Board, Ottawa, Ontario (Canada)). Jul 1982. 64p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85701236.

Prepared for the Atomic Energy Control Board.

A series of field measurements of miners mixed exposure to radon and daughters, uranium ore dust and respirable quartz, was conducted in an open-pit mine in Northern Saskatchewan during 1980-81. Control of radon gas levels in the mining equipment cabs is required. Dust may be reduced by minimizing the resuspension of dust from contaminated surfaces within the cabs.

The work of the Stable Isotope Group of the Institute of Nuclear Sciences during 1982, in the fields of isotope geology, isotope hydrology, geochronology, isotope biology and mass spectrometer instrumentation, is described.

32312 (JAERI-M—83-161) **Irradiation effect on animal feeds and feedstuffs.** Kume, Tamikazu. (Japan Atomic Energy Research Inst., Tokyo). Oct 1983. 103p. (In Japanese). NTIS (US Sales Only), PC A06/MF A01. File Number DE85701051.

Aiming to secure the safety of animal feeds and develop the new resources, the effect of γ-irradiation on disinfection and the changes in components were investigated. Salmonellae and coliforms contaminating animal feeds and feedstuffs were eliminated by 0.5 – 0.6 Mrad and 0.5 – 0.8 Mrad, and osmophilic moulds were sterilized by 0.7 – 0.75 Mrad. From these results, it is concluded that the dose for disinfection of animal feeds is 0.8 Mrad. The main components were hardly changed by irradiation up to 5 Mrad, and the component changes in irradiated samples could be suppressed during storage while the components in unirradiated samples were markedly changed with the growth of osmophilic moulds. Histamine and lysinoalanine, which may cause the feed poisoning, were never accumulated in feedstuffs by irradiation. The nutritional value of chick feeds was not changed by 1.0 Mrad irradiation. From these results, it is considered that no problem for wholesomeness of animal feeds occurs by irradiation. Therefore, the irradiation is effective for disinfection and keeping the nutritional value of animal feeds during storage. Irradiation promotes the recovery of proteins in the wastewater by coagulation of proteins and improves the property of coagulants due to the degradation of polysaccharides. These results indicate that irradiation is effective to develop the new resources for animal feeds.

32313 (JINR—19-83-884) **Role of DNA repair in the realization of oxygen effect in bacteria Escherichia coli irradiated with various types of radiation. The balance of repair systems and the sensitivity to radiation.** Kozubek, S.; Krasavin, E.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1983. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701049.

The role of the balance of E. coli repair systems in the sensitivity to ionizing radiation of different LETs is considered. The influence of modifying factors on the balance between fast (2) and slow (3) repair systems is analysed. It is shown that in the case of γg-irradiation of aerobic cells the decreased power of repair 3 in some limits can be compensated by increased power of repair 2 so that the sensitivity remains constant. In anaerobic conditions decreasing power of repair 3 leads inevitably to markedly increased sensitivity. Different mechanisms of the action of radioprotectors on the repair balance in aerobic or anaerobic state are discussed. The role of repair balance in the radiosensitivity of irradiated wild type cells is shown to become unimportant for high LET radiation owing to the presence of markedly increased ratio of direct double-strand breaks.

32314 (KFK—3782) **Triennial report 1981-83 of the Institute for Genetics and for Toxicology.** Hotz, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Genetik und Toxikologie von Spaltstoffen). Jul 1984. 180p. NTIS (US Sales Only), PC A09/MF A01. File Number DE85780948.

The scientific activity of the Divisions of Genetics and of Toxicology of the Institute for Genetics and for Toxicology during the period January 1981 to December 1983 is described. In addition to reports on the various research topics this second 'Report' also gives an overview of the external scientific and teaching activities of the staff members during the period. In the field of radiation genetics most of the interest has been focussed on the mechanisms of gene repair, gene regulation and the molecular biology of tumor viruses in human and other mammalian cells. The main emphasis of the long term toxicology program has been on studies of radiotoxicology of the actinides and other heavy metals, especially in relation to chelation therapy and to the development of biochemical and physical methods for investigation of their metabolic behaviour.

32315 (LBL—19500) **Role of protein synthesis in the repair of sublethal x-ray damage in a mutant Chinese hamster ovary cell line.** Yezzi, M.J. (Lawrence Berkeley Lab., CA (USA)). Apr 1985. Contract AC03-76SF00098. 158p. NTIS, PC A08/MF A01; GPO Dep. File Number DE85011990.

Thesis.

A temperature-sensitive mutant for protein synthesis, CHO-TSH1, has been compared to the wild-type cell, CHO-sC1, in single- and split-radiation-dose schemes. When the exponentially growing TS mutant and the wild-type cells were treated at 40$_{o}$C for up to 2 hrs prior to graded doses of x rays, the survival curves were identical and were the same as those obtained without heat treatment. If the cultures were incubated at 40°C for 2 hrs before a first dose and maintained at 40°C during a 2 hr dose fractionation interval, repair of radiation damage was reduced in the mutant compared to the wild type. These observations implied that a pool of proteins was involved in the repair of sublethal x-ray damage. However, if repair was measured by the alkaline-unwinding technique under the same time and temperature schemes, no difference in the kientics of DNA strand rejoining was observed. Misrepair processes may permit restoration of DNA strand integrity but not allow functional repair. The effect of diminished repair under conditions of inhibition of protein synthesis was found to be cell-cycle dependent in survival studies with synchronized mutant cell populations. Repair was found to be almost completely eliminated if the temperature sequence described above was applied in the middle of the DNA synthetic phase. Treatment of cell populations in the middle of G_1-phase yielded repair inhibition comparable to that observed with the asynchronous cells. Splitdose experiments were done using pre-incubation with cycloheximide to chemically inhibit protein synthesis. WT cells and TS cells were treated with cycloheximide at 35°C for 2 hrs before a first dose and during a 2 hr dose fractionation interval. 23 figs., 7 tabs.

32316 (N—85-17550) **Computer subroutines for estimation of human exposure to radiation in low Earth orbit.** Cucinotta, F.A.; Wilson, J.W. (National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center). Feb 1985. 26p. (NASA-TM—86324; L—15865). NTIS, PC A03/MF A01.

Computer subroutines to calculate human exposure to trapped radiations in low Earth orbit (LEO) on the basis of a simple approximation of the human geometry by spherical shell shields of varying thickness are presented and detailed. The subroutines calculate the dose to critical body organs and the fraction of exposure limit reached as a function of altitude of orbit, degree of inclination, shield thickness, and days in mission. Exposure rates are compared with current exposure limits.

In Annual report June 1984. [Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Center].

There exists a need for relevant information on the molecular and cellular processes induced by radiation. In this project several aspects of the problem of developing a human tumor model and growing human cells in culture, have been investigated. Human embryo fibroblasts were grown in 1000 mm plastic Petri dishes in a suitable nutrient medium, supplemented with 10% fetal calf serum and antibiotics. The following series of mutagens were utilized: ultra-violet radiation, chemical carcinogens and nucleosite analogues, such as 5-azacytidine (aza C). Some of the treated human fibroblasts were also examined by electron microscopy and the reverse transcriptase assay.

32319 (NIRS-M—41, pp 35-45) **Mutation in cultured mammalian cells. Dose and dose-rate effects.** Nakamura, N.; Okada, S. (Tokyo Univ. (Japan). Faculty of Medicine). Mar 1982. NTIS (US Sales Only), PC A15/MF A01. File Number DE85781032. (CONF-811082—).

From Workshop on tritium radiobiology and health physics; Chiba, Japan (1 Oct 1981).

Mammalian cell cultures were exposed to gamma-rays at various dose rates. Dose-rate effects were observed in cultured somatic cells of the mouse for cell killing and mutations resistant to 6-thioguanine (TGsup(r)) and to methotrexate (MTXsup(r)). Linear quadratic model may be applied to cell killing and TGsup(r) mutations in some cases but can not explain the whole data. Results at low doses with far low dose-rate were not predictable from data at high doses with acute or chronic irradiation. Radioprotective effects of dimethyl sulfoxide were seen only after acute exposure but not after chronic one, suggesting that damages by indirect action of radiations may be potentially reparable by cells. TGsup(r) mutations seem to contain gross structural changes whereas MTXsup(r) ones may have smaller alterations.

32320 (NIRS-M—41, pp 46-59) **Transformation and mutation of golden hamster embryo cells induced by low doses of x-rays.** Watanabe, M.; Suzuki, N.; Nikaido, O. (Kanazawa Univ. (Japan). Faculty of Pharmaceutical Sciences). Mar 1982. NTIS (US Sales Only), PC A15/MF A01. File Number DE85781032. (CONF-811082—).

From Workshop on tritium radiobiology and health physics; Chiba, Japan (1 Oct 1981).

A new cell system which makes quantitative analysis possible in both mutation and transformation induced by low doses of X-rays was described and the frequencies of both mutation and transformation were compared in relation to DNA repair which takes place in X-irradiated cells. Golden hamster embryo (GHE) cells were employed to show the availability of the system for the efficient detection of both mutants and transformants concomitantly. The mutation frequency of the cell population irradiated with various doses of X-rays was expressed as the ratio of the number of 8-azaguanine resistant colonies to the 10^5 colonies formed in normal medium. A linear increase in mutation frequency with increasing dose was observed at doses ranging from 100 to 600 rad. There was no significant increase in mutation frequency with doses below 100 rad. On the other hand, the transformation frequency of the cells was expressed as the ratio of the number of the transformed colonies to the total number of colonies counted. A drastic increase in the transformation frequency was observed when cells were irradiated with less than 100 rad of X-rays. DNA repair might be involved in modifying transformation frequency and survivals of GHE cells, and DNA synthesis might be involved in inducing transformation in GHE cells. It seems that the repair of potentially lethal damage taking place in density-inhibited GHE cells within 24 hours after X-irradiation decreases the frequencies of both transformation and mutation. Furthermore, it is evident that the system using GHE cells is sensitive enough to assess the transformational effect of low doses of X-rays.

32321 (NIRS-M—41, pp 60-67) **Radiation effects on cultured mouse embryos in relation to cell division cycle.** Domon, M. (Tokyo Medical and Dental Univ. (Japan). School of Dentistry). Mar 1982. NTIS (US Sales Only), PC A15/MF A01. File Number DE85781031. (CONF-811082—).

From Workshop on tritium radiobiology and health physics; Chiba, Japan (1 Oct 1981).

The authors have worked with mouse embryos in vitro asking first, what are the suitable parameters to define the radiation sensitivity of embryos, and second what is a major factor determining it. The LD_{50} was adopted as a parameter of the radiation sensitivity of a population in a mouse embryo system in culture. The fertilized ova were collected into Whitten's medium at various times during the pronuclear and 2-cell stages of development. They were irradiated in chambers with X-rays at doses of 0 to 800 rads. After the embryos were cultured, a set of the lethal fractions for various X-ray doses were obtained. Regarding the radiation sensitivity variation of the embryos, the LD_{50} varied from 100 to 200 rads during the pronuclear stage and from 100 to 600 rads during the 2-cell stage. The embryos during the pronuclear stage were most radioresistant at early G_2 phase, followed by an increase in the sensitivity. The embryos during the 2-cell stage were also most radioresistant at early G_2 phase and were more sensitive when they got close to either the first or the second cleavage division. Furthermore, it seems that the factor 6 of the large variation was due to the extremely long G_2 period, 14 hrs for the 2-cell embryos. That is, the pooled 2-cell embryos were in a relative sense well synchronized with G_2 phase. In contrast, the synchrony was poor during the pronuclear stage, which led to less variation of the LD_{50} for the pronuclear embryos. It is concluded that during the early cleavage stages of mice, radiosensitivity is mainly governed by the content of cells of various cell cycle ages in the embryo.

Special consideration of tritium distribution, turnover and microdosimetry.** Carsten, A.L.; Commerford, S.L.; Cronkite, E.P. (Brookhaven National Lab., Upton, NY (USA)); Brooks, A. Mar 1982. NTIS (US Sales Only), PC A15/MF A01. File Number DE85781031. (CONF-811082—).

From Workshop on tritium radiobiology and health physics; Chiba, Japan (1 Oct 1981).

Somatic and genetic effects of the continuous ingestion of tritiated water (HTO) at concentrations of 0.3, 1.0 and 3.0 μCi/ml were investigated in mice of the Hale-Stoner-Brookhaven strain. At these levels, there was no measurable somatic effect. Although genetic effects as measured by dominant lethal mutation (DLM) assay indicated a significant effect ($P>0.01$) on the number of viable embryos and early deaths in the 3.0 μCi/ml HTO group and on the number of viable embryos in the 1.0 μCi/ml HTO group, no genetic effects were significantly noted in the 0.3 μCi/ml HTO group. Liver cytogenetic studies showed a significant increase in the number of abnormal cells in the 3.0 μCi/ml HTO group. A reduction in bone marrow stem cells, without an attendant reduction in total marrow cellularity, was noted in the 3.0 and 1.0 μCi/ml HTO groups. There was no significant difference in any of the DLM parameters between animals maintained on 3.0 μCi/ml of HTO and animals exposed to the equivalent ^{137}Cs gamma dose (22 hours/day exposure). Consideration of the relative amounts and biological half lives of tritium present in the nucleus as water, DNA and histone suggests that after transient exposure to tritiated water, nearly all significant radiation damage can be attributed to tritium present in the nucleus as water. These data suggest that hazards from tritium attendant with normal reactor operation should not at this time be considered as a deterrent to the further development of fission and/or fusion reactor technology.

32323 (NIRS-M—41, pp 120-134) **Low-exposure tritium radiotoxicity in mammals.** Dobson, R.L. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Mar 1982. NTIS (US Sales Only), PC A15/MF A01. File Number DE85781031. (CONF-811082—).

From Workshop on tritium radiobiology and health physics; Chiba, Japan (1 Oct 1981).

A special feature of tritium radiation is the very low energy of the beta particles (5.7 keV average, 18 keV maximum). This low energy results in very short particle ranges in tissue, ranges that are less than cell dimensions. Another result of the low energy is that the ionization density along beta-ray tracks (even though the tracks are short) is significantly greater than that associated with secondary electrons from gamma rays. The studies of tritium radiotoxicity reviewed, involving chronic ^{3}HOH exposures in mammals, demonstrate in both mice and monkeys that biological effects can be measured following remarkably low levels of exposure — levels in the range of serious practical interest to radiation protection.

32324 (NIRS-M—41, pp 219-227) **Metabolism of tritiated water in foetuses and newborn mice.** Ujeno, Y.; Takimoto, K. (Kyoto Univ. (Japan). Faculty of Medicine). Mar 1982. NTIS (US Sales Only), PC A15/MF A01. File Number DE85781031. (CONF-811082—).

From Workshop on tritium radiobiology and health physics; Chiba, Japan (1 Oct 1981).

The compartment models of transplacental transfer of tritiated water injected into pregnant females, to foetuses and of lacteal transfer of tritiated water injected into nursing females, to suckling newborn mice were presented, respectively. There are many assumptions in the models and they do not fit the experimental data well. However, some of the differences between the models and experimental data can be qualitatively explained by physiological reasoning. The changes in the kidney functions of pregnant women are also the important factors which have to be considered to analyze the dynamics. The present dynamics analyses with mice can contribute to the understanding of the dynamics of tritiated water in humans.

32325 (NUREG—1134) **Radiation protection training for personnel employed in medical facilities.** McElroy, N.L.; Brodsky, A. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research). May 1985. 59p. NTIS, PC A04/MF A01 - GPO. File Number TI85901511.

This report provides information useful for planning and conducting radiation safety training in medical facilities to keep exposures as low as reasonably achievable, and to meet other regulatory, safety and loss prevention requirements in today's hospitals. A brief discussion of the elements and basic considerations of radiation safety training programs is followed by a short bibliography of selected references and sample lecture (or session) outlines for various job categories. This information is intended for use by a professional who is thoroughly acquainted with the science and practice of radiation protection as well as the specific procedures and circumstances of the particular hospital's operations. Topics can be added or substracted, amplified or condensed as appropriate. 8 refs.

32326 (OEFZS—4307) **DNA metabolism and poly(ADP-ribose)-synthesis in lymphocytes of persons exposed to low doses of ionizing radiation.** Klein, W.; Kocsis, F.; Topaloglou, A. (Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H.). Jan 1985. 15p. (In German). (BL—496/85). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701470.

Genetic parameters, like semiconservative DNA synthesis, UDS after UVC in vitro, sedimentation of nucleoids and PAR synthesis, are influenced in lymphocytes of persons exposed to low doses of ionizing radiation. These effects are dependent on the topicality of the charge.

32327 (ORNL—6164) **1983 international intercomparison of nuclear accident dosimetry systems at Oak Ridge National Laboratory.** Swaja, R.E.; Greene, R.T.; Sims, C.S. (Oak Ridge National Lab., TN (USA)). Apr 1985. Contract AC05-84OR21400. 42p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85011303.

An international intercomparison of nuclear accident dosimetry systems was conducted during September 12-16, 1983, at Oak Ridge National Laboratory (ORNL) using the Health Physics Research Reactor operated in the pulse mode to simulate criticality accidents. This study marked the twentieth in a series of annual accident dosimetry intercomparisons conducted at ORNL. Participants from ten organizations attended this intercomparison and measured neutron and gamma doses at area monitoring stations and on phantoms for three different shield conditions. Results of this study indicate that foil activation techniques are the most popular and accurate method of determining accident-level neutron doses at area monitoring stations. For personnel monitoring, foil activation, blood sodium activation, and thermoluminescent (TL) methods are all capable of providing accurate dose estimates in a variety of radiation fields. All participants in this study used TLD's to determine gamma doses with very good results on the average. Chemical dosemeters were also shown to be capable of yielding accurate estimates of total neutron plus gamma doses in a variety of radiation fields. While 83% of all neutron measurements satisfied regulatory standards relative to reference values, only 39% of all gamma results satisfied corresponding guidelines for gamma measurements. These results indicate that continued improvement in accident dosimetry evaluation and measurement techniques is needed.

32328 (PNL—5500-Pt.1, pp 39-41) **Inhalation hazards to uranium miners.** Cross, F.T. Feb 1985. NTIS, PC A07/MF A01. File Number DE85009365.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 1. Biomedical sciences.

This project is investigating levels of uranium mine air contaminants, using both large and small experimental animals to model human respiratory system disease. Lung cancer and deaths by degenerative lung disease have reached epidemic proportions among uranium miners, but the cause-effect relationships for these diseases are based on inadequate epidemiological data. This project identifies agents or combinations of agents (both chemical and radiological), and their exposure levels, that produce respiratory tract lesions, including respiratory epithelial carcinoma, pneumoconiosis, and emphysema. Histopathologic data from rats are shown for approximately 300- to 10,000-working-level-month (WLM) radon-daughter exposures. Exposure of male rats to radon daughters and uranium ore dust continues, along with exposure of male and female beagle dogs to uranium ore dust alone. 4 tables.

32329 (PNL—5500-Pt.1, pp 13-22) **Inhaled plutonium oxide in dogs.** Park, J.F. Feb 1985. NTIS, PC A07/MF A01. File Number DE85009365.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 1. Biomedical sciences.

This project is concerned with long-term experiments to determine the lifespan dose-effect relationships of inhaled $^{239}PuO_2$ and $^{238}PuO_2$ in beagles. The data will be used to estimate the health effects of inhaled transuranics. Beagle dogs given a single exposure to $^{239}PuO_2$ or $^{238}PuO_2$ aerosols to obtain graded levels of initial lung burdens are being observed for lifespan dose-effect relationships. Mortality due to radiation pneumonitis and lung tumor increased in the four highest dose-level groups exposed to $^{239}PuO_2$, during the 13-yr postexposure period. During the 10 1/2 years after exposure to $^{238}PuO_2$, mortality due to lung and/or bone tumors increased in the three highest dose-level groups. Chronic lymphopenia, occurring 0.5 to 2 year after exposure, was the earliest observed effect after inhalation of either $^{239}PuO_2$ or $^{238}PuO_2$ in the four highest dose-level groups that had initial lung burdens $\geqq$ 80 nCi. 3 figures, 6 tables.

32330 (PNL—5500-Pt.1, pp 28-30) **Low-level $^{239}PuO_2$ lifespan studies.** Sanders, C.L. Feb 1985. NTIS, PC A07/MF A01. File Number DE85009365.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 1. Biomedical sciences.

This project will produce data to generate a dose-response curve (and to evaluate other statistical methods that also incorporate survival time) for lung-tumor incidence in Wistar rats following inhalation of $^{239}PuO_2$ at levels producing lifetime radiation doses to the lung of < 5 to > 2000 rad. The lung clearance of ^{239}Pu is best represented by a two-exponential equation, with 78% of the initial alveolar depositions (IAD) cleared with a half-time of 19 days and 22% cleared with a half-time of 180 days. A total of 593 of 2134 exposed and 242 of 1058 sham-exposed rats have died. Among the dead rats, the percent with primary lung tumors was 71% for the 150-nCi group, 70% for the 82-nCi group, and 23% for the 32-nCi group. No lung tumors have been found in controls, and only three have been found at an IAD of < 7.5 nCi. 1 figure, 3 tables.

32331 (PNL—5500-Pt.1, pp 43-47) **Fetal and juvenile radiotoxicity.** Sikov, M.R. Feb 1985. NTIS, PC A07/MF A01. File Number DE85009365.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 1. Biomedical sciences.

This project is directed at obtaining detailed comparative information on the deposition, distribution, retention, and toxicity of radionuclides in the prenatal and juvenile mammal. Because quantitative data cannot necessarily be extrapolated to man, emphasis is also directed toward establishing patterns, phenomenologic interactions, and relationships which will be useful in determining appropriate exposure levels for rapidly growing infants or children and for pregnant women. Further dosimetry for an experiment to evaluate the effects of foster-rearing of newborn rats on the lifetime effects of ^{239}Pu exposure has demonstrated that most of the lifetime burden is derived from prenatal exposure and that milk contributes little in addition. Other measurements have confirmed a tentative observation that the lifetime burden in offspring is greater with near-term exposure than with exposure earlier in gestation. Additional results from a comparison of the embryotoxicity of ^{239}Pu and ^{241}Am have confirmed that, on the basis of dose administered to the dam, the former has a greater effect on the conceptus. Pilot studies indicate that ^{233}U is teratogenic, acting as a chemical rather than as a radiological teratogen. Studies with ^{239}Pu-exposed pregnant rabbits have shown that maternal distribution differs from that in rodents; concentration patterns in the placenta and membranes also differed. 4 figures, 1 table.

32332 (PNL—5500-Pt.1, pp 55-57) **Gut-related studies of radionuclide toxicity.** Sullivan, M.F. Feb 1985. NTIS, PC A07/MF A01. File Number DE85009365.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 1. Biomedical sciences.

The behavior of radioactive materials that may be ingested as a consequence of a reactor accident, unavoidable occupational exposure, or after release to the environment and incorporation into the food chain is investigated. Current emphasis is on evaluating hazards from ingested actinides as a function of animal age, species, nutrition, and diet, or chemicophysical state of the actinide. The authors are also concerned with the behavior of actinides that are inhaled and pass through the gastro-intestinal tract after clearance from the lungs. The radionuclides being investigated are ^{238}Pu, ^{241}Am, ^{244}Cm, ^{147}Pm, ^{109}Cd, and ^{210}Pb. 2 tables.

32333 **(REG/G—2-85-Draft) Guide for the preparation of applications for licenses for the use of sealed sources in gas chromatography devices and x-ray fluorescence analyzers. Draft.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research). Feb 1985. 22p. US Nuclear Regulatory Commission, Washington, DC 20555. File Number TI85901245.

A regulatory guide is presented to provide assistance to applicants and licensees in preparing applications for new licenses, license amendments, and license renewals for the use of sealed sources in gas chromatography devices and x-ray fluorescence analyzers. (ACR)

32334 **37-year medical follow-up of Manhattan Project Pu workers.** Voelz, G.L.; Grier, R.S.; Hempelmann, L.H. (Los Alamos National Lab., NM). *Health Physics;* **48**: No. 3, 249-259(Mar 1985).

Twenty-six male subjects, who worked with Pu during World War II under extraordinarily crude conditions, have been given medical examinations periodically over the past 37 y to identify potential health effects. Inhalation was the primary mode of the Pu exposures. Current estimates of the systemic Pu depositions in these individuals range from 2 to 95 nCi with a mean of 26 nCi. Seven individuals have depositions of 40 nCi or more, often considered the lifetime maximum permissible body burden for workers. Two individuals have died compared to 6.6 expected deaths based on US adjusted rates for white males. The causes of death were myocardial infarction and accidental trauma. Examinations completed in 1981-82 revealed no cases of cancer in the group except for a history of skin cancers in three individuals. The diseases and physical changes noted in these individuals are characteristic of a male population in their upper 50s or 60s. This study yields no evidence suggesting that adverse health effects have resulted from the 37 y of exposure to internally deposited Pu.

32335 **Identity of the photoproduct that causes lacI mutations in UV-irradiated Escherichia coli.** Lawrence, C.W.; Christensen, R.B.; Christensen, J.R. (Univ. of Rochester, NY). *Journal of Bacteriology;* **161**: No. 2, 767-768(Feb 1985). Contract AC02-76EV03490.

Estimates of the capacity of photoreactivation to act specifically on premutational lesions were obtained by conjugational transfer of an F' lac plasmid from a UV-irradiated, photoreactivated donor to a Δ(pro-lac) recipient that had been UV irradiated and allowed to induce SOS functions for 30 min. This treatment reduced the frequency of induced lacI mutations by 70 to 80%, indicating that cyclobutane dimers cause most mutations in this system.

32336 **Formation of radiation-induced DNA breaks: the ratio of double-strand breaks to single-strand breaks.** Roots, R.; Kraft, G.; Gosschalk, E. (Lawrence Berkeley Lab., CA). *International Journal of Radiation Oncology, Biology and Physics;* **11**: No. 2, 259-265(Feb 1985). Contract AC03-76SF00098.

Ionizing radiation causes the formation of strand breaks in cellular DNA, as well as other types of lesions in the chromatin of cells. Some of the earliest investigations of the molecular basis of radiation-induced damage and the implications of enzymatic repair were done by Dr. H. S. Kaplan. Because it is difficult to assay for DNA lesions in the large mammalian genome, the authors have developed a method of assaying for DNA double-strand breaks in the supercoiled nucleosome-complexed Simian virus 40 (SV40) genome, irradiated intracellularly. In this communication they present their measurements of the DNA double-strand breaks (DSBs) to single-strand breaks (SSBs) ratio obtained from the intracellularly irradiated SV40 genome. After cobalt gamma ray and X ray irradiations, this ratio is about 1/10. Their methods and results are compared with pertinent data in the literature. If the DSBs/SSBs ratio of 1/10 for cellular chromatin is correct, a substantial number of DNA double-strand breaks are formed in a mammalian cell after moderate doses (1 Gy) of radiation. The implications of different types of DNA double-strand breaks are discussed.

32337 **Precision, high dose radiotherapy: helium ion treatment of uveal melanoma.** Saunders, W.M.; Char, D.H.; Quivey, J.M.; Castro, J.R.; Chen, G.T.Y.; Collier, J.M.; Cartigny, A.; Blakely, E.A.; Lyman, J.T.; Zink, S.R. (Univ. of California, San Francisco). *International Journal of Radiation Oncology, Biology and Physics;* **11**: No. 2, 227-233(Feb 1985). (CONF-8310342—). Contract AC03-76SF00098.

From 25. annual meeting of the American Society of Therapeutic Radiologists; Los Angeles, CA, USA (3 Oct 1983).

The authors report on 75 patients with uveal melanoma who were treated by placing the Bragg peak of a helium ion beam over the tumor volume. The technique localizes the high dose region very tightly around the tumor volume. This allows critical structures, such as the optic disc and the macula, to be excluded from the high dose region as long as they are 3 to 4 mm away from the edg the tumor. Careful attention to tumor localization, treatment planning, patient immobilization and treatment verification is required. With a mean follow-up of 22 months (3 to 60 months) the authors have had only five patients with a local recurrence, all of whom were salvaged with another treatment. Pretreatment visual acuity has generally been preserved as long as the tumor edge is at least 4 mm away from the macula and optic disc. The only serious complication to date has been an 18% incidence of neovascular glaucoma in the patients treated at our highest dose level. Clinical results and details of the technique are presented to illustrate potential clinical precision in administering high dose radiotherapy with charged particles such as helium ions or protons.

32338 **Correction of a nucleotide-excision-repair mutation by human chromosome 19 in hamster-human hybrid cells.** Thompson, L.H.; Mooney, C.L.; Burkhart-Schultz, K.; Carrano, A.V.; Siciliano, M.J. (Lawrence Livermore National Lab., CA). *Somatic Cell and Molecular Genetics;* **11**: No. 1, 87-92(Jan 1985).

A UV-sensitive mutant line of CHO cells, UV20, was shown to be phenotypically corrected to resistance by fusion with human lymphocytes or fibroblasts. Only human chromosome 19 correlated with the DNA repair phenotype of resistant hybrid clones and their resistant or sensitive subclones. This study demonstrates the mapping of a human repair gene by direct selection of complementing hybrids in the presence of a DNA-damaging agent (mitomycin C).

32339 **Ultraviolet action spectra for DNA dimer induction, lethality, and mutagenesis in Escherichia coli, with emphasis on the UVB region.** Peak, M.J.; Peak, J.G.; Moehring, M.P.; Webb, R.B. (Argonne National Lab., IL (USA)). *Photochemistry and Photobiology;* **40**: No. 5, 613-620(Nov 1984).

Ultraviolet action spectra were obtained for lethality and mutagenesis (reversion to tryptophan independence) in Escherichia coli WP2s for wavelengths 254-405 nm with detailed analysis in the UVB region. Parallel chemical assay yields of pyrimidine dimers in DNA of E. coli RT4 were determined. lethality, mutagenesis and dimer induction all decreased with increasing wavelength. Between 300 and 320 nm, the mutagenesis action spectrum coincides closely with the absorption spectrum of DNA. The lethality spectrum is closely parallel to the mutagenicity spectrum. A calculation derived from the slope of the UVB spectra reveals that a 10nm shift of the solar UV spectrum to shorter wavelengths would result in a 35% increase in its mutagenic potential. At 325 nm, both biological action spectra show sharp decreases in slope. In addition, above 325 nm the spectra for lethality, mutagenicity and dimer formation diverge sharply; lethalities at these UVA wavelengths were approximately tenfold greater relative to mutagenicity than at shorter wavelengths. The relative yield of dimer formation by 365 nm radiation is intermediate between the yibits replication. The authors ask whether the increase in the dTTP/dCTP ration in mutagenized whole cells either contributes to or prolongs induced inhibition of replication. In addition they proposed that such an induced dNTP imbalance may also contribute to an increase in mutations by enhancing the probability for base-misincorporation.

32342 **DNA repair in B. subtilis: an inducible dimer specific W-reactivation system.** Fields, P.I.; Yasbin, R.E. (Pennsylvania State Univ., University Park). *Molecular and General Genetics;* **190**: 475-480(1983). Contract AC02-81ER60017.

The W-reactivation system of Bacillus subtilis repairs pyrimidine dimers in bacteriophage DNA. This inducible repair system can be activated by treatment of the bacteria with UV, alkylating agents, cross-linking agents and gamma radiation. However, bacteriophage treated with agents other than those that cause pyrimidine dimers were not repaired by this unique form of W-reactivation. In contrast, the W-reactivation system of Escherichia coli repairs a variety of damages in the bacteriophage DNA. 35 references, 4 figures.

5602 Thermal Effects

32343 **(DTH-LV—161) Why do even low air velocities cause thermal discomfort.** Lund Madsen, T. (Danmarks Tekniske Hoejskole, Lyngby. Lab. for Varmeisolering). 1984. 7p. (CONF-840803—18). NTIS (US Sales Only), PC A02/MF A01. File Number DE85750803.

From 3. international conference on indoor air quality and climate; Stockholm, Sweden (20 Aug 1984).

In this paper a hypothesis is set up in order to explain the discrepancy between the relatively high acceptable air velocities found during climate chamber tests, and the much lower acceptable velocities found under many practical circumstances. A thermal-electrical analog model of the human skin including thermal receptors has been developed. The model is based on the similarity of the mathematical equations describing thermal and electrical conduction. The air velocity field which test persons have been exposed to in a climate chamber is recorded on magnetic tape. It is now possible to impress this air velocity field on the analog model and measure the output from the thermal receptor and later to impress the constant air velocity which will cause the same mean output from the receptors. The comparison between this velocity and the actual mean air velocity measured in the climatic chamber, and the votes from the test persons form a basis for the hypothesis.

32344 **Toxic and osmotic effects of glycerol on human granulocytes.** Armitage, W.J.; Mazur, P. (Univ. of Tennessee-Oak Ridge Graduate School of Biomedical Sciences). *American Journal of Physiology;* **247**: No. 5, C383-C389(Nov 1984). Contract W-7405-ENG-26.

Human granulocytes are damaged by exposure to concentrations of glycerol as low as 0.5 M. We therefore investigated the addition of glycerol to granulocytes and its subsequent dilution under various conditions to try to distinguish between toxic and harmful osmotic effects of glycerol. The lesion caused by glycerol at 0°C was expressed as a loss of plasma membrane integrity (as visualized by fluorescein diacetate) only after incubation (≧1 h) at 37°C. This damage was not ameliorated when osmotic stress was lessened by reducing the rates of addition and dilution of glycerol to keep the computed cell volume within 80-170% of isotonic cell volume. However, when osmotic stress was reduced further by increasing the temperature of addition and dilution of glycerol from 0° to 22°C, the tolerance of the cells to 1 M glycerol increased somewhat. Reducing exposure to glycerol to 3 min or less at 0°C greatly increased survival, but this time was too short to allow glycerol to equilibrate intracellularly. Finally, the presence of extra impermeant solute (NaCl or sucrose) in the medium to reduce the equilibrium cell volume to 60% of isotonic cell volume enabled granulocytes to survive 30-min exposure to 1 M glycerol at 0°C, but cells had to remain shrunken during the 37°C incubation to prevent the loss of membrane integrity. Suspensions that contained damaged granulocytes formed aggregates when incubated at 37°C, and these aggregates were responsible for a major fraction of the observed loss in viability.

32345 **Osmotic tolerance of human granulocytes.** Armitage, W.J.; Mazur, P. (Univ. of Tennessee-Oak Ridge Graduate School of Biomedical Sciences). *American Journal of Physiology;* **247**: No. 5, C373-C381(Nov 1984). Contract W-7405-ENG-26.

Human granulocytes are injured when returned to isotonic conditions after exposure at 0°C to hyperosmotic solutions of NaCl or sucrose with osmolalities above 0.6 osmolal. The damage was expressed as a loss of membrane integrity [fluorescein diacetate (FDA) assay] only after 60-90 min incubation at 37°C. Survival after exposure to a 1.4-osmolal solution at 0°C was dependent on the extent of subsequent dilution. Dilution to below 0.6 osmolal was damaging, but cells could be returned to near-osmotic conditions provided that the solute concentration was increased again to 0.64 osmolal before the cells were incubated at 37°C. Granulocyte cell volumes were measured under various osmotic conditions by computer-assisted micrometry. The cells did not display a minimum volume but behaved as osmometers over the observed range of 0.2-1.4 osmolal. Granulocyte volume at a given osmolality was independent of whether the cells had first been exposed to a strongly hyperosmotic medium, indicating that no solute loading occurred in hyperosmotic sucrose solutions. Even though the cells did not survive sequential exposure to >0.6 osmolal solutions, subsequent return to isotonicity, and incubation at 37°C, neither cell lysis nor loss in FDA-positive cells occurred after the first two steps. This finding is not consistent with the critical-surface area-increment theory of freezing injury. The mechanism of cell injury in hyperosmotic solutions is thus not known. However, the results show that osmotic stress is potentially a major damaging factor both in the equilibration of cells with protective additives and during freezing and thawing.

32346 **(ANL/EES-TM—276) Estimating risks of lead-induced hemoglobin decrements under conditions of uncertainty: methodology, pilot judgments, and illustrative calculations.** Whitfield, R.G.; Wallsten, T.S. (Argonne National Lab., IL (USA)). Sep 1984. Contract W-31-109-ENG-38. 66p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85012293.

This report focuses on probabilistic judgments about dose-response relationships between lead exposure and subsequent hemoglobin decrements. It describes a method for obtaining the judgments, representing them mathematically, and combining them with a measure of lead exposure to estimate health risks. The method is easily applied to other health effects as well. A study was performed to test a protocol for obtaining probabilistic judgments from health experts. Judgments of two pilot subjects were encoded to determine the subjects' judgmental dose-response functions for lead-induced hemoglobin decrements. Their judgments were represented mathematically (with the normal-on-log-odds function) and combined with blood-lead data (a measure of exposure to lead) from the National Health and Nutrition Examination Survey II to illustrate the estimation of health risks for US children aged 0 to 3 years. The report also discusses ways to summarize large amounts of complex risk assessment data and calculations and present them in a form understandable by and useful to decision makers. The pilot encodings and the ensuing calculations provided valuable experience that can be applied to both the planned encodings of the judgments of experts on the health effects of lead and the development of risk estimates partially based on those judgments. 4 refs., 16 figs., 12 tabs.

32347 **(CEA-R—5282) Transfer of SO_2 and effects on plants.** Angeletti, L. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France)). Sep 1984. 38p. (In French). NTIS (US Sales Only), PC A03/MF A01. File Number DE85751221.

After a short review of the natural and artificial sources of sulfur and its effect on plants, the studies on the effects of SO_2 on the aerial parts of plants and on rain-plant interaction are assessed. The importance of the components of the climate on SO_2 foliar uptake is emphasized and a critical analysis is made of the methods used to measure SO_2 uptake by plants and of their results. The present scientific knowledge does not allow a realistic assessment of the amounts retained by plants, which forbids to establish dose-effect relationships, and consequently prevents any action in order to control and standardize SO_2 emissions by fossil-fueled electric power plants.

32348 **(DOE/CH/00016—T7) Anaerobic microbial transformations in subsurface environments.** Bollag, J.M.; Berry, D.F.; Chanmugathas, P. (Pennsylvania State Univ., University Park (USA). Dept. of Agronomy; Brookhaven National Lab., Upton, NY (USA)). Apr 1985. Contract AC02-76CH00016. 14p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012790.

The first draft of a literature review article entitled, "Metabolism of Homocyclic (Benzenoid) and Heterocyclic Aromatic Compounds by Microorganisms Under Anaerobic Conditions" is completed. The article covers biodegradation of both heterocyclic and homocyclic aromatic compounds under a variety of conditions including nitrate reducing, fermentation, sulfate reducing, and methanogensis. Laboratory experiments have been designed to study the anaerobic biotransformation processes involving organic substance derived from energy residual wastes. The test compounds selected for the initial anaerobic biodegradation experiments include aniline, indole, and pyridine. A Hungate apparatus is presently in operation.

32349 **(DOE/EV/03221—81) Nature of oxygen containing radicals in radiation chemistry and photochemistry of aqueous solutions. Final progress report, July 1982-July 1983.** Czapski, G. (Hebrew Univ., Jerusalem (Israel). Dept. of Physical Chemistry). 1983. Contract AC02-76EV03221. 33p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85013327.

This report summarizes the results of research on the physical and chemical properties of ozonide and hydroperoxy radical in aqueous solutions, particularly in biological systems. The effects of the presence of copper and iron on oxygen toxicity were studied. (ACR)

32350 **(GSF-A—1/84) Trace element analytical chemistry in medicine and biology.** (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.); Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF), Bonn (Germany, F.R.)). 1984. 108p. (CONF-8404246—Absts.). NTIS (US Sales Only), PC A06/MF A01. File Number DE85752003.

From 3. international workshop on trace element analytical chemistry in medicine and biology; Neuherberg, F.R. Germany (16 Apr 1984).

The present abstract-book contains 76 abstracts of papers dealing with the analysis and content of trace elements in food, plants, animals and man, healthy or with different diseases.

32351 **(NP—5770296) Effects of sulphur dioxide on plants with special reference to biochemical and physiological responses.** Schlee, D. (Universitaets- und Landesbibliothek Sachsen-Anmhalt, Halle (German Democratic Republic)). 1982. 138p. (In German). NTIS (US Sales Only), PC A07/MF A01. File Number DE85770296.

This bibliography contains over 1300 titles listed according to author in alphabetical order, whereby no effort has been made to include all references on this subject. The rapid increase in publications from 1960 onwards can clearly be correlated with the increase in SO_2 concentrations in the air, which at the present time amounts to some $160x10^6$ t a^{-1}. Earlier contributions largely described the biological damage caused by SO_2 whereas contemporary papers deal chiefly with modern research on the analysis of effects at the molecular and cellular level. Metabolic changes and alterations in the ultra-structure of the cell, along with photosynthetic processes, transpiration and SO_2-uptake are of primary importance in this respect.

32352 **(PNL—5434) Harvester ant bioassay for assessing hazardous chemical waste sites.** Gano, K.A.; Carlile, D.W.; Rogers, L.E. (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 88p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85013031.

A technique was developed for using harvester ants, Pogonomyrmex owhyeei, in terrestrial bioassays. Procedures were developed for maintaining stock populations, handling ants, and exposing ants to toxic materials. Relative toxicities were determined by exposing ants to 10 different materials. These materials included three insecticides, Endrin, Aldrin, and Dieldrin; one herbicide, 2,4-D; three complex industrial waste residuals, wood preservative sludge, drilling fluid, and slop oil; and three heavy metals, copper zinc, and cadium. Ants were exposed in petri dishes containing soil amended with a particular toxicant. Under these test conditions, ants showed no sensitivity to the metals or 2,4-D. Ants were sensitive to the insecticides and oils in repeated tests, and relative toxicity remained consistent throughout. Aldrin was the most toxic material followed by Dieldrin, Endrin, wood preservative sludge, drilling fluid, and slop oil. 12 refs., 2 figs., 2 tabs.

32353 **(PNL—5500-Pt.1, pp 85-86) Metal-membrane interactions.** Schneider, R.P. Feb 1985. NTIS, PC A07/MF A01. File Number DE85009365.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 1. Biomedical sciences.

Using zinc uptake system of Neurospora crassa as a model system, the kinetics and regulation of heavy metal uptake by eukaryotic microorganisms were investigated. The authors performed experiments designed to show whether free Zn^{2+} or the zinc-citrate complex is the form recognized by the zinc-membrane receptor. These experiments showed that the affinity of the uptake system is the same for free zinc or the citrate chelate, indicating that the receptor is indifferent to the form of the metal. The system is highly specific; i.e., zinc uptake is not affected by 100-fold higher concentrations of Co, Pb, U, Ni, Ca, Mg or Fe. Uptake of Zn is inhibited by Hg and Cd, but these two metals are not taken up by the system at measurable rates.

32354 **(PNL—5500-Pt.1, pp 31-33) Cigarette smoke and plutonium.** Filipy, R.E. Feb 1985. NTIS, PC A07/MF A01. File Number DE85009365.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 1. Biomedical sciences.

Autoradiographic techniques with liquid photographic emulsion and cellulose nitrate track-etch film are being used to investigate the spatial distribution of inhaled plutonium in the lungs of beagle dogs exposed to cigarette smoke or to the plutonium aerosol only. More plutonium than expected was detected on the inner surfaces of bronchi, and particles were observed beneath the bronchial mucosa. 2 figures, 2 tables.

32355 **(ZfI-Mitt—77, pp 268-273) Effect of acute prenatal hypoxia on the incorporation of ^{15}N in the brain and liver protein of rats aged 6 and 11 days.** Plath, C.; Richter, I.; Heine, W. (Rostock Univ. (German Democratic Republic). Bereich Medizin); Zhukova, T.P.; Sorokina, E.G. (Akademiya Meditsinskikh Nauk SSSR, Moscow. Inst. Pediatrii). Sep 1983. NTIS (US Sales Only), PC A14/MF A01. File Number DE85780083. (CONF-8305218—Summ.).

From Recent results of /sup 15/N tracer technique in medicine symposium; Rostock, German D.R. (29 May 1983).

Studies with ^{15}N-labelled amino acids revealed, that an early and correctly balanced supply of concentrated proteins or amino acids must be available during the early neonatal period, because of the diminution of protein synthesis in the newborn, especially those having already been damaged prenatally.

32356 **Lung clearance, translocation, and acute toxicity of arsenic, beryllium, cadmium, cobalt, lead, selenium, vanadium, and ytterbium oxides following deposition in rat lung.** Rhoads, K.; Sanders, C.L. (Pacific Northwest Lab., Richland, WA). *Environmental Research;* **36**: No. 2, 359-378(Apr 1985). Contract AC06-76RL01830.

Young adult rats were exposed via inhalation or intratracheal instillation to oxides of arsenic, beryllium, cadmium, cobalt, lead, selenium, vanadium, and ytterbium. Serial necropsies were performed to assess the metal content in organs at times up to several weeks after exposure. The lung clearance varied widely for these compounds, and the times to remove 50% of the initial burden ranged from 18 min for vanadium to 400 days for beryllium. Arsenic, cadmium, lead, selenium, and vanadium were initially soluble in lung, but a small fraction (1-20%) remained there over the long term. Extrapulmonary tissues often accumulated substantial amounts of the soluble oxides, and whole-body retention was often greater for compounds that were more soluble in lung. Arsenic, selenium, and vanadium translocated to carcass and bone. Arsenic, cadmium, lead, and selenium accumulated in the liver, and the kidney retained cadmium and lead. Beryllium, cobalt and ytterbium did not deposit at any extrapulmonary site in significant amounts. In general, the aqueous solubility of these compounds was a poor predictor for behavior in vivo because of their interaction with metabolic processes. Of the metal oxides tested for acute lethality following pulmonary deposition, cadmium was most toxic, followed by selenium, vanadium, and arsenic.

32357 **L-Phenylalanine and L-tyrosine catabolism by selected Streptomyces species.** Pometto, A.L. III; Crawford, D.L. (Univ. of Idaho, Moscow). *Applied and Environmental Microbiology;* **49**: No. 3, 727-729(Mar 1985). Contract AS07-80ER10775.

L-Phenylalanine and L-tyrosine were completely catabolized through homogentisate by Streptomyces setonii 75Vi2 but only partially degraded by Streptomyces badius 252, Streptomyces sioyaensis P5, Streptomyces viridosporus T7A, and Streptomyces sp. strain V7. Intermediates of catabolism were confirmed by the thin-layer, gas, and high-pressure liquid chromatography. Homogentisate 1,2-dioxygenase was present in all cell extracts.

32358 **Sodium-sugar coupling stoichiometry in chick intestinal cells.** Kimmich, G.A.; Randles, J. (Univ. of Rochester, NY). *American Journal of Physiology;* **247**: No. 1, C74-C82(Jul 1984). Contract AC02-76EV03490.

Sodium-dependent sugar transport systems involve the function of membrane components that couple the transmembrane flow of Na^+ to the concomitant flow of certain sugar molecules. The coupling stoichiometry between Na^+ and sugar fluxes via these systems must be measured under conditions in which the membrane potential does not change due to the induction of transport or during the interval of flux measurement. This can be accomplished by utilizing gradients of highly permeant ions (NO_3^- and K^+ plus valinomycin) to create diffusion potentials of sufficient magnitude that the sugar-induced Na^+ flux does not introduce an appreciable change in the imposed potential. Under these conditions, the coupling stoichiometry for chicken intestinal cells proves to be 2 Na^+:1 sugar as reported earlier for studies performed in the absence of a membrane potential. When control of the potential is not maintained, a coupling ratio of 1:1 is observed. The stoichiometry does not change as a function of Na^+ concentration, which suggests that carrier forms with only one Na^+ bound do not contribute to the carrier-mediated Na^+ or sugar fluxes. When no potential is present, the stoichiometry is modified by the level of intracellular Na^+ and sugar in a manner indicative of a transport mechanism in which Na^+ must dissociate from the loaded carrier at the inward facing membrane surface before the sugar molecule dissociates.

32359 **Distinguishing effects of anemia and muscle iron deficiency on exercise bioenergetics in the rat.** Davies, K.J.A.; Donovan, C.M.; Refino, C.J.; Brooks, G.A.; Packer, L.; Dallman, P.R. (Univ. of California, Berkeley). *American Journal of Physiology;* **246**: No. 6, E535-E543(Jun 1984). Contract W-7405-ENG-48.

Three weeks of dietary iron deficiency in weanling rats resulted in anemia (Hb, 39 vs 14.2 g/dl in controls) and decreased oxidative capacities of skeletal muscle (as much as 90% below control values). Whole-animal maximal O_2 consumption V/sub 0_2//sub max//, measured in a brief treadmill run of progressively increasing work load, was ~50% lower for iron-deficient rats than for controls, and maximal endurance capacity (time to exhaustion in a separate treadmill run at a constant, sub- V/sub 0_2//sub max// work load) was 90% lower from iron-deficient rats than for controls. Exchange transfusion with packed erythrocytes or plasma, was used to adjust Hb to an intermediate concentration of approximately 9.5 g/dl in both iron-deficient and control rats. This procedure corrected the V/sub 0_2//sub max// of iron-deficient rats to within 15% of control values, whereas endurance capacity showed no improvement. Our experimental dissociation of V/sub 0_2//sub max/// and endurance capacity provides further evidence that V/sub 0_2//sub max// is not the sole determinant of endurance. We propose that defects in V/sub 0_2//sub max// during iron deficiency result primarily from diminished O_2 delivery, whereas decreased endurance capacity reflects impaired muscle mitochondrial function.

32360 **Effects of $CdCl_2$ on the maternal-to-fetal clearance of ^{67}Cu and placental blood flow.** Chertok, R.J.; Kullgren, B.; Burbank, D. (Oak Ridge National Lab., TN). *Proceedings of the Society for Experimental Biology and Medicine;* **176**: No. 1, 138-142(May 1984). Contract AC05-76OR00033.

Copper is an essential element while Cd is an extremely toxic heavy metal of questionable biological usefulness. Cadmium has been reported to interfere with the metabolism of Cu, be teratogenic, and decrease blood flow in the fetal placenta. Because of these reported biological interactions of Cd and Cu, this investigation was conducted to determine the effects of Cd on placental transport of ^{67}Cu and placental blood flow in the guinea pig. All guinea pigs used were 60 +/- 1 days pregnant. A placental perfusion technique was used to measure the maternal-to-fetal clearance of ^{67}Cu and ^3H_2O across the placenta. The clearance of ^3H_2O served as an indicator of placental blood flow on the maternal side of the circulation. The results indicated that an iv injection of 1 mg Cd/kg body weight resulted in an immediate increase in the clearance of ^{67}Cu which declined over the next 8 min to an elevated level compared to the extrapolated best-fit curve of control values. This iv injection of $CdCl_2$ concomitantly reduced the maternal-to-fetal clearance of ^3H_2O across the placenta. In conclusion, an acute exposure of the pregnant female to $CdCl_2$ results in an increased maternal-to-fetal clearance ^{67}Cu and a reduced placental blood flow that can alter the supply of nutrients to the developing embryo or fetus, and therefore modify normal development.

32361 **Kinetic characterization of $^{13}NH_3$ and $[^{13}N]$glutamine metabolism in rabbit heart.** Krivokapich, J.; Barrio, J.R.; Phelps, M.E.; Watanabe, C.R.; Keen, R.E.; Padgett, H.C.; Douglas, A.; Shine, K.I. (Univ. of California, Los Angeles). *American Journal of Physiology;* **246**: No. 1, H267-H273(Jan 1984). Contract AC03-76SF00012.

The isolated arterially perfused rabbit interventricular septum was used to study the effects of methionine sulfoximine (MSO) on ^{13}N-labeled ammonia ($^{13}NH_3$) and ^{13}N-labeled glutamine ($[^{13}N]$) metabolism. Tissue time-activity curves were generated from bolus injections of $^{13}NH_3$ or $[^{13}N]$gln delivered interarterially during control conditions and in the presence of MSO. The fraction of ^{13}N label retained in the tissue [EF(3)] was significantly less after a bolus of $[^{13}N]$gln than $^{13}NH_3$. MSO significantly decreased the EF(3) after a bolus of $^{13}NH_3$ or $[^{13}N]$gln. Chemical analyses using high-pressure liquid chromatography on tissue and effluent samples obtained after bolus injections of $^{13}NH_3$ and $[^{13}N]$gln with or without MSO present showed the following: 1) after a bolus of $^{13}NH_3$ or $[^{13}N]$gln the tissue ^{13}N label is predominantly in $[^{13}N]$gln at 6 min after injection, and 2) MSO significantly decreases the synthesis of $[^{13}N]$gln after an $^{13}NH_3$ bolus. Thus it would appear that the glutamine synthetase reaction is primarily responsible for the retention of the ^{13}N label from $^{13}NH_3$ as $[^{13}N]$gln in rabbit myocardium.

32362 **Mutagenicity and cytotoxicity of five antitumor ellipticines in mammalian cells and their structure-activity relationships in Salmonella.** DeMarini, D.M.; Cros, S.; Paoletti, C.; Lecointe, P.; Hsie, A.W. (Univ. of Tennessee-Oak Ridge Graduate School of Biomedical Sciences). *Cancer Research;* **43**: 3544-3552(Aug 1983). Contract W-7405-ENG-26.

The mutagenicity and cytotoxicity of five antitumor compounds (ellipticines) were investigated in the Chinese hamster ovary cell hypoxanthine-guanine phosphoribosyltransferase assay and in six strains of Salmonella. All five compounds (ellipticine, 9-

methoxyellipticine, 9-hydroxyellipticine, 9-aminoellipticine, and 2-methyl-9-hydroxyellipticinium) were cytotoxic and mutagenic in the Chinese hamster ovary cell hypoxanthine-guanine phosphoribosyltransferase assay in the presence or absence of Aroclor 1254-induced rat liver S9, and all except the last compound were mutagenic in Salmonella. Based on the reversion pattern obtained in various frame-shift and DNA repair-proficient (uvrB$^+$) or -deficient (uvrB) strains of Salmonella in the presence or absence of S9, the first three compounds appear to cause frameshift mutations by both intercalation and covalent bonding with DNA; thus, these are classified as reactive intercalators. However, 9-aminoellipticine intercalates only weakly and may instead exert its mutagenic activity primarily (or exclusively) by forming a covalent adduct with DNA. Compared to the published antitumor data obtained in mice, the results in Salmonella and Chinese hamster ovary cells suggest that the ability of ellipticine, 9-methoxyellipticine, and 9-hydroxyellipticine to intercalate with DNA, induce frame-shift mutations, and cause cell killing is associated with and may be the basis for their antitumor activity. The observation that the ellipticines are mutagenic in mammalian cells suggests that these antitumor agents may be carcinogenic.

32363 Clearance of sulfuric acid-introduced ^{35}S from the respiratory tracts of rats, guinea pigs and dogs following inhalation or instillation. Dahl, A.R.; Felicetti, S.A.; Muggenburg, B.A. (Inhalation Toxicology Research Institute, Albuquerque, NM). *Fundamental and Applied Toxicology;* **3**: 293-297(Jul-Aug 1983). Contract AC04-76EV01013.

The clearance of sulfuric acid-introduced ^{35}S from the upper and lower respiratory tracts of rats, guinea pigs and dogs was measured. Sulfuric acid was administered by instillation and by inhalation for each species. Clearance into the blood and gastrointestinal tract was measured along with determination of ^{35}S remaining at the site of administration at sacrifice. Different rates of clearance from different sites within the dog lung were indicated with rates of clearance increasing with decreasing airway diameter. Half-times of clearance from all sites in the lung and for all species were from 2-9 min. There appeared to be some species differences, with clearance for dogs being slower than for guinea pigs, which was slower than for rats. Upper respiratory tract clearance was much slower than for lung and may not have been primarily by way of the blood. The data indicate that the clearance of sulfuric acid-introduced ^{35}S in vivo is faster than previous studies in isolated perfused lungs had indicated. The results may be general for water soluble, ionized chemical species. 13 references, 3 figures, 1 table.

32364 Extent of histone modifications and H1^0 content during cell cycle progression in the presence of butyrate. D'Anna, J.A.; Gurley, L.R.; Tobey, R.A. (Los Alamos National Lab., NM). *Experimental Cell Research;* **147**: 407-417(1983).

The effects of butyrate upon the extents of phosphorylation of histones H1 and H1^0 during cell-cycle progression have been investigated. Chinese hamster (line CHO) cells were synchronized in early S phase and released into medium containing 0 or 15 mM butyrate to resume cell-cycle traverse into G1 of the next cell cycle. Cells were also mechanically selected from monolayer cultures grown in the presence of colcemid and 0 or 15 mM butyrate to obtain >98% pure populations of metaphase cells. Although cell cycle progression is altered by butyrate, electrophoretic patterns of histones H1, H1^0, H3, and H4 indicate that butyrate has little, if any, effect on the extents of H1 and H1^0 phosphorylation during the cell cycle or the mitotic-specific phosphorylation of histone H3. Butyrate does, however, inhibit removal of extraordinary levels of histone H4 acetylation (hyperacetylation) during metaphase, and it appears to cause an increase in the content of H1^0 in chromatin during the S or G2 phases of the cell cycle. 38 references, 4 figures, 1 table.

32365 TPA induces simultaneous alterations in the synthesis and organization of vimentin. Laszlo, A.; Bissell, M.J. (Lawrence Berkeley Laboratory, CA). *Experimental Cell Research;* **148**: 221-234(1983). Contract AC03-76SF00098.

The authors have found an increased rate of vimentin synthesis in TPA-treated chicken embryonic-fibroblasts, as shown by two-dimensional electrophoretic separation of newly synthesized polypeptides. The capacity of TPA to elicit this effect correlated with its activity as a tumor promoter. Treatment with TPA also altered the organization of the vimentin-containing intermediate filaments, as revealed by immunofluorescence. Treatments which inhibited the TPA-induced rearrangements of vimentin filaments did not prevent the increase in the rate of vimentin synthesis, indicating that gross alterations in cytoskeletal organization were not the immediate cause of the altered vimentin synthesis. On the other hand, alterations in the rate of vimentin synthesis may be a necessary, but not sufficient condition for alterations in vimentin filament organization. TPA as a positive modulator of vimentin synthesis may serve as a useful probe for an eventual understanding of the dynamics of the mechanisms that control the assembly and organization of vimentin filaments. 35 references, 5 figures, 2 tables.

32366 Specific gene mutations in L5178Y cells in culture: a report of the US Environmental Protection Agency gene-tox program. Clive, D.; McCuen, R.; Spector, J.F.S.; Piper, C.; Mavournin, K.H. (Oak Ridge National Lab., TN). *Mutation Research;* **115**: 225-251(1983). Contract W-7405-ENG-26.

The predominant test system uses a near-diploid L5178Y mouse lymphoma cell line and is based on the quantitation of forward mutations occurring at the heterozygous thymidine kinase (TK) locus. (Other markers, such as ouabain- or methothrexate-resistance and alanine independence, in other L5178Y mouse lymphoma cells were also examined, but our criteria for the acceptability of data or the paucity of data considerably reduced the value of these mutagenesis test systems to this study). The biochemical basis for the L5178Y/TK/sup +/-/ assay depends on the ability of TK-competent cells to phosphorylate 5-bromo-2-deoxyuridine or trifluorothymidine. The phosphorylated product or its metabolites kill these cells, thus, medium containing 5-bromo-2-deoxyuridine or trifluorothymidine is capable of selecting for cells that are lacking the TK enzyme (TK/sup -/-/). TK/sup -/-/ cells eventually give rise to a bimodal distribution of colony sizes. The relative proportion of small and large colonies appears to be characteristic of the mutagen, its dose, and the length of the expression period. A total of 108 references were reviewed and 48 chemical agents were evaluated. Of these, in vivo carcinogenicity data existed for 44 and covered a wide variety of chemical classes (43 compounds) and a complex mixture. In this system, 39 agents were positive, 1 was negative, and 4 yielded inconclusive results. The 44 test substances evaluated were insufficient to single out agents or agent classes for which the assay was particularly well suited; however, with the exception of thymidine analogs, the system seems to be versatile. Thus the assay is of value in the battery approach to mutagenicity/carcinogenicity screening. 43 references, 9 tables.

32367 Genetics and specificity of the constitutive excision repair system of Bacillus subtilis. Friedman, B.M.; Yasbin, R.E. (Univ. of Rochester, NY). *Molecular and General Genetics;* **190**: 481-486(1983). Contract AC02-81ER60017.

An isogenic set of DNA repair-proficient and -deficient strains of B. subtilis, cured of all prophages, were constructed and analyzed for their sensitivities to selected mutagens. The results demonstrated that the lethal damage caused by ultraviolet (UV) radiation and by 4-nitroquinoline-1-oxide (4NQO) were repaired by the bacterial excision and/or recombination repair systems. In contrast, the lethal damages caused by ethyl methane sulfonate (MMS) were removed from the DNA by the recombination repair system of the bacteria, and not by the excision repair system. Significantly, the bacteria required both a functional recombination repair system and a functional excision repair system in order to remove the DNA damage caused by the bifunctional alkylating agent mitomycin C (MC). 43 references, 5 figures, 2 tables.

32368 Genotoxicity of tobacco smoke and tobacco smoke condensate. DeMarini, D.M. (Oak Ridge National Lab., TN). *Mutation Research;* **114**: 59-89(1983). Contract W-7405-ENG-26.

An attempt is made to review the types of genetic effects that are induced by tobacco smoke and by the particulate matter of cigarette smoke condensate. Published reports on the mutagenicity of cigarette smoke condensate and cigarette smoke in Salmonella are reviewed. Only a few papers have been published on the genetic toxicity of cigarette smoke in lower eukaryotes such as yeast and Neurospora. Cigarette smoke has been shown to cause sister-chromatid exchange in cells, including Salmonella, and abnormal sperm morphology in mice and humans. The epidemiology of tobacco-related diseases is discussed. 148 references, 1 table.

32369 **Influence of ethanol and methanol gasoline blends on the mutagenicity of particulate exhaust extracts.** Clark, C.R.; Dutcher, J.S.; McClellan, R.O.; Naman, T.M.; Seizinger, D.E. (Inhalation Toxicology Research Institute, Albuquerque, NM). *Archives of Environmental Contamination and Toxicology;* **12**: 311-317(1983). Contract AC04-76EV01013.

The Salmonella mutagenicity test was used to evaluate the influence of alcohol fuel extenders on the genetic toxicity of particulate exhaust extracts. Four spark-ignition engine equipped vehicles were operated on gasoline alone, 10% blends of ethanol or methanol in gasoline, and a commercially available gasohol. Dichloromethane extracts of the exhaust particles from all tests were mutagenic in Salmonella typhimurium strains TA 100 and TA 98. The extracts were less mutagenic in the nitroreductase deficient strains TA 98NR and TA98DNPR suggesting that nitro substituted polycyclic aromatic hydrocarbons may be responsible for part of the mutagenicity. In all the alcohol blended fuel tests, the mass of particle associated organics emitted from the exhaust was lower than that observed during the control tests using gasoline alone. Thus, in most cases, estimates of the emission of mutagenic combustion products from the exhaust were lower in the alcohol blend tests. 21 references, 5 tables.

32370 **Simulated acidic precipitation causes direct injury to vegetation.** Shriner, D.S. (Oak Ridge National Lab., TN). *Proceedings of the American Phytopathological Society;* **1**: 112(1975). (CONF-750616—).

From Annual meeting of the air pollution control association; Boston, MA, USA (16 Jun 1975).

Seedlings of Pinus strobus, Quercus phellos, Phaseolus vulgaris and Glycine max were exposed to a simulated sulfuric acid rain (pH 3.2) in the greenhouse or field. Seedlings of Pinus taeda were exposed to rain of pH 1.9 to 6.1. All plants showed yellow or brown necrotic zones at pH 3.2 or lower. Field exposure of white pine for 2 months to 2-4 cm of pH 3.2 rain per week caused browning of all second year needles. The kidney bean leaves developed necrotic spots (1-2 mm) on 15% to 40% of leaf after as little as three 0.6 cm, pH 3.2 rain applications. The soybean and oak developed similar symptoms of equal severity under like treatment. A single (40 minute) application of pH 1.9 to 2.7 rain induced random needle injury on the loblolly pine.

32371 **(DOE/EV/10566—T1) Mechanisms of mutagenesis: analysis through the use of alcohol dehydrogenase in Drosophila. Progress report, February 1984-January 1985.** Sofer, W.H. (Rutgers--the State Univ., Piscataway, NJ (USA). Waksman Inst. of Microbiology). 1985. Contract AC02-81EV10566. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85005702.

A technique was developed for somatic transformation, making it possible to inject embryos with ADH genes in a variety of forms. A selection procedure was developed to chemically select strains of flies that are lacking beta - galactosidase activity. Two strains of Adh-negative flies whose lesions were generated with formaldehyde were characterized with respect to the ADH protein they manufacture, the rate at which they synthesize ADH, and the nature of the ADH mNRNA they make. (ACR)

32372 **(DOE/RA/50219—T4) Effects of 60 Hz electric fields on operant and social stress behaviors of nonhuman primates. Project technical status report, February 16, 1985-April 12, 1985.** Rogers, W.R. (Southwest Research Inst., San Antonio, TX (USA)). 19 Apr 1985. Contract AC02-80RA50219. 33p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85011992.

Objective was to investigate possible behavioral effects of exposure to high-intensity 60-Hz electric fields. Four projects are being conducted: aversive sensory character of exposure to fields, threshold intensity for detection of fields, chronic exposure effects on performance of two operant tasks, and observation of behavior of social groups under chronic exposure. Electric field testing with animals has begun. Behavioral testing had to be suspended in order to repair cages and suppress corona, and to conduct engineering tests. (DLC)

32373 **(EPRI-EA—3898) Effects of high-voltage transmission lines on honeybees.** Greenberg, B.; Bindokas, V.P.; Gauger, J.R. (Bioconcern, Inc., Chicago, IL (USA); IIT Research Inst., Chicago, IL (USA)). May 1985. 72p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920668.

When shielded and exposed colonies were placed at incremental distances at a right angle from a 760-kV transmission line different thresholds for biologic effects were obtained. Hive exposures were controlled (E-field: 7, 5.5, 4.1, 1.8, and 0.65 to 0.85 kV/m) by variable height current collectors; shielded hives under the line behave normally. Exposure to 7 kV/m can produce the following sequence of events: (1) increased motor activity and transient hive temperature increase; (2) abnormal propolization; (3) retarded hive weight gain; (4) excess queen cell production with queen loss; (5) reduction of sealed brood area; and (6) poor winter survival. No biological effects were detected below 4.1 kV/m, thus the "biological effects corridor" is limited to approximately 23 m beyond a ground projection of each outer phase wire. Hive architecture enhances E-fields and creates shock hazards for bees. Intra-hive E-fields (15 to 100+ kV/m) were measured with a displacement current sensor and fiber optic telemetry link. Step-potential-induced currents up to 0.5 uA were measured with a bee model in hives at 7 kV/m. To investigate further the role of shock versus electric field exposure the study was continued to develop hive entrance extensions (porches), which produce controlled bee exposure to E-field or shock, and to test the feasibility of using these porches in such a study. Biological effects (e.g., abnormal propolization, retarded hive weight, queen loss) found in colonies with total-hive exposure were produced by entrance-only exposure of adult bees. We now have an exposure system in which E-field and shock can be separately controlled to reproduce the biological effects. 10 refs.

32374 (PNL—5500-Pt.1, pp 79-81) **Biological effects of magnetic fields.** Kelman, B.J. Feb 1985. NTIS, PC A07/MF A01. File Number DE85009365.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 1. Biomedical sciences.

The scope of this project is best understood within the historical context of previously completed work. The objective has been to evaluate the effects of magnetic fields on a variety of biological systems. These systems have included dominant lethal studies in mice, prenatal development in rats, fertilization and embryonic development in trout, synthetic membranes, and long-term exposure of mice. The first controlled life-time study of mice exposed to a strong magnetic field (1 tesla) concluded this year. The study was carried out in a unique facility which permitted exposure and sham-exposure of animals under nearly identical conditions. No pattern of changes related to exposure was clearly identified in this study; several individual measurements were statistically significant and will require some further analysis to determine whether they are related to exposure.

32375 (ZfI-Mitt—77, pp 280-288) **Evaluation of the protein catabolism following deep burns by means of ^{15}N tracer technique.** Pietsch, G. (Karl-Marx-Universitaet, Leipzig (German Democratic Republic). Bereich Medizin); Czarnetzki, H.D. (Rostock Univ. (German Democratic Republic). Bereich Medizin); Faust, H.; Jung, K. (Akademie der Wissenschaften der DDR, Leipzig. Zentralinstitut fuer Isotopen- und Strahlenforschung). Sep 1983. (In German). NTIS (US Sales Only), PC A14/MF A01. File Number DE85780083. (CONF-8305218—Summ.).

From Recent results of /sup 15/N tracer technique in medicine symposium; Rostock, German D.R. (29 May 1983).

In pigs with experimental severe burns the catabolism of proteins was determined by measuring the total cumulative ^{15}N excretion, the cumulative ^{15}N-urea excretion and the ^{15}N concentration of the serum.

57 HEALTH AND SAFETY

REFER ALSO TO CITATION(S) 31477

32376 (AD-P—004490/9/XAB) Personnel protection equipment for use with laser chemicals. Smith, I.D.; Roepke, J. (National Aeronautics and Space Administration, Las Cruces, NM (USA). White Sands Test Facility). Aug 1984. 11p. NTIS, PC A02/MF A01.

This article is from JANNAF (Joint Army-Navy-NASA-Air Force) Safety and Environmental Protection Subcommittee Meeting (1984) Held at Las Cruces, New Mexico on 7-11 May 1984, AD-B086 924L, p299-309.

The NASA White Sands Test facility (WSTF) recently built the fluid distribution system for the Army's High Energy Laser System Test Facility (HELSTF). As part of the effort, WSTF personnel were required to activate the fluorine system. To insure adequate personnel protection during the fluorine system activation, a project was undertaken to evaluate and qualify personnel protection equipment to be used during the activation (passivation) activity. Previous work in the late 60's and early 70's showed that very few materials were totally satisfactory for use with fluorine. Little if any work has been done to measure the degree of protection afforded against either fluorine gas or hydrofluoric acid (HF), the principal residual reactive material. Two general types of tests were conducted to evaluate materials. These were (1) fluorine and HF gas permeation tests, and (2) high-velocity fluorine gas-impingement tests. The gas permeation tests were designed to exposure one side of the material to the gas at concentrations of up to 27% F2 or 1.5% HF in designed to expose one side of the material to the gas at concentrations of up to 27% F2 or 1.5% HF in GN2 with a gas purge on the opposite side leading to the detection system. The tests showed that all of the materials tested which included ILC Dover Chloropel, glove materials - Neoprene, Viton, leather, butyl rubber, face shield materials, etc., where neither permeated by HF at a 1200 ppm level nor by F2 in GN2 at concentrations as high as 27% by volume. The gas-impingement tests were designed to represent a high-pressure gas leak or the cracking of a B-nut on a system containing residual fluorine gas.

32377 (DOE/ER—0193/1) Health physics/radiation protection enrollments and degrees, 1984. (Oak Ridge Associated Universities, Inc., TN (USA)). Mar 1985. Contract AC05-76OR00033. 61p. NTIS, PC A04/MF A01 - GPO; GPO Dep. File Number TI85011032.

The 1984 health physics survey was sent to 68 institutions. Sixty-two of them reported data from active programs. Total enrollment in undergraduate and graduate health physics or radiation protection programs increased in the fall of 1984 by 13% over 1983. Undergraduate enrollment rose by 5% to 400, and graduate enrollment increased by 22% to 805. The number of bachelor's degrees awarded in 1984 increased by 7% over 1983 to 146, master's degree awards increased by 11% to 181, and doctoral degrees increased by 14% to 50. 29% of bachelor's graduates intended to continue their studies. The largest employer of bachelor's and doctoral degree graduates was medical facilities; and at the master's level, nuclear utilities represented the largest employer. The second largest employer of bachelor's was nuclear utilities, of master's was medical facilities, and of doctorates was US academic institutions. Foreign national enrollment at the undergraduate level remained about the same as 1983. Statistics are also given for women and minorities, and regional distribution.

32378 (DOE/PE/17056—T3) Fire protection review revisit No. 2, Argonne National Laboratory, Argonne, Illinois. Dobson, P.H.; Earley, M.W.; Mattern, L.J. (Factory Mutual Research Corp., Norwood, MA (USA)). May 1985. Contract AC01-84PE17056. 91p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85013245.

A fire protection survey was conducted at Argonne National Laboratory on April 1-5, 8-12, and April 29-May 2, 1985. The purpose was to review the facility fire protection program and to make recommendations or identify areas according to criteria established by the Department of Energy. There has been a substantial improvement in fire protection at this laboratory since the 1977 audit. Numerous areas which were previously provided with detection systems only have since been provided with automatic sprinkler protection. The following basic fire protection features are not properly controlled: (1) resealing wall and floor penetrations between fire areas after installation of services; (2) cutting and welding; and (3) housekeeping. The present Fire Department manpower level appears adequate to control a "routine" fire. Their ability to adequately handle a high-challenge fire, or one involving injuries to personnel or fire spread beyond the initial fire area is doubtful.

32379 (LMF—113, pp 323-326) Mixtures of toxic agents and the risk of health effects. Seiler, F.A. Dec 1984. NTIS, PC A23/MF A01. File Number DE85009283.

In Inhalation Toxicology Research Institute annual report, October 1, 1983-September 30, 1984.

A mathematical description is given for the risk of health effects caused by combinations of insults. The approach is completely phenomenological and has no built-in restrictions due to theories concerning the etiology of the health effect. It is restricted only by the empirical set of algebraic forms selected for the cause-effect relationship between exposure parameters and the risks incurred. Examples are given for a special case of low-risk cause-effect functions that depend on a power of dose.

32380 (PB—85-180396/XAB) Report on electrocutions, electric shock, and electric burn injuries involving consumer products. final report. (Safety Sciences, San Diego, CA (USA)). Sep 1984. 247p. (F—8324). NTIS, PC A11/MF A01.

See also PB85-180404.

This report provides direction to a project to reduce the number of electrocution, electric shock and electric burn injuries. The first section uses CPSC data to rank the consumer products involved in these accidents on the basis of frequency, severity, and number of products in use. It also analyzes demographic and accident characteristics. The second section contains a technical review of accidents occurring in eight product groups: Portable Power Tools; Welders, Battery Chargers and Inverters; Personal Hygiene Products; Entertainment Products; Lawn and Garden Tools; Installed Stoves, Ranges and Cook Tops; Refrigerators and Freezers; and Fans. This section also includes a review of the relevant Underwriters Laboratories (UL) standards and suggestions for potential action to reduce the accidents involving these eight product groups.

32381 (PB—85-180404/XAB) Report on electrocutions, electric shock, and electric-burn injuries involving consumer products. Appendices. (Safety Sciences, San Diego, CA (USA)). Sep 1984. 406p. (F—8324-APP). NTIS, PC A18/MF A01.

See also PB85-180396; Portions of this document are not fully legible.

This report contains the following appendices: Description of data bases; Overall distribution of the data by data base and product category (scope); Generic products and product codes; NEISS cross tabulations (frequency counts); FRASE coded case summaries; Product frequency by data base (all cases); Products ranked by frequency for each data base (all cases); Products ranked by frequency for each data base (in scope cases only).

32382 (AERE-G—3226) Mathematical modelling of fracture hydrology. Progress report January-June 1984. Rae, J.; Hodgkinson, D.P.; Robinson, P.C.; Lever, D.A. (UKAEA Atomic Energy Research Establishment, Harwell. Theoretical Physics Div.). Oct 1984. 8p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701515.

This progress report contains notes on four aspects of hydrological modelling. The first three describe the development of transport models for solute moving with groundwater in fractured rock and the application of the models to field experiments in Cornwall, UK and Chalk River, Canada. The fourth section describes network models which have been used to estimate hydrodynamic dispersion and are in process of being extended to three dimensional systems.

32383 (CBPF-NF—003/83) Archaeological dating by thermoluminescence: a review. Poupeau, G. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 57p. (In French). NTIS (US Sales Only), PC A04/MF A01. File Number DE85701449.

A review of the thermoluminescence applications to the archaeological dating is presented. The physical principles used in this method are stressed.

32384 (CBPF-NF—004/83) Thermoluminescence dating of burnt cherts from the Alice Boer site (Brazil). Beltrao, M.daC.M.C.; Enriquez, C.R.; Danon, J.; Zuleta, E.; Poupeau, G. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). Jan 1983. 33p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701450.

More than 40 culturally burnt cherts from the Alice Boer site near Rio Claro, Sao Paulo State, have been studied by thermoluminescence (TL). Nine of these were found to be sufficiently heated by early man to reset the TL clock to zero and thereby be suitable for TL dating. These cherts define, for the upper half of the uppermost cultural layer (layer III), a time scale for the presence of man from 2,220 to 11,000 years. This time range is in essential agreement with the geological-paleoclimatological age estimate for the end of deposition of this layer, as well as with radiocarbon dates. In particular, it lends support to a radiocarbon age of 14,000 BP for a deeper level. The overall geochronologic results are not in contradiction with earlier statements that the deepest cultural layer (layer V) at Alice Boer might have been deposited at least 20,000 years ago.

32385 (DOE/ER/60182—1) Remote sensing of hydrologic transport processes using spot simulation data. Final report, August 1, 1983-April 30, 1985. Gardner, T.W.; Petersen, G.W.; Connors, K.F.; Baumer, G.M. (Pennsylvania State Univ., University Park (USA). Office of Remote Sensing of Earth Resources). Apr 1985. Contract AC02-83ER60182. 125p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE85012412.

The objective was to make a preliminary evaluation of the utility of the next generation of high resolution, digital satellite imagery to characterize surface hydrology and geomorphology in both arid and humid regions. The data set was generated in a program that simulated data from a new French satellite, SPOT, scheduled for launch in 1985. The simulated data has three multispectral (MS) bands (0.50 to 0.59μm, 0.61 to 0.69μm, and 0.79 to 0.89μm) with 20m ground resolution and a panchromatic band (0.51 to 0.73μm) with 10m ground resolution. Resolution of the SPOT system allows for landscape classification at level III and occasionally level IV across distinctly different climatic zones and in areas disturbed by different types of energy exploitation. Ten features are distinguished on the semiarid site. For the humid-temperature site six classes of disturbed land are distinguished whereas only two classes are generally distinguishable with LANDSAT-3 data. Given the SPOT feature recognition and the extensive data base on Quaternary history and rates of surficial geomorphic processes for the two study sites in the San Juan Basin of northwestern New Mexico and the Bituminous Coal Fields of west central Pennsylvania, it was possible to recognize and classify critical components of the hydrologic system as well as landscape stability. These component maps include: (1) infiltration/potential runoff rate maps; (2) groundwater recharge/discharge site maps; (3) landscape stability maps; and (4) fluvial erosion intensity maps. Eight analytic techniques, including manual interpretation of 4 types of analog imagery (color composite, Eigen image, Intensity-Hue-Saturation image, and band ratio image) and 4 types of statistical analyses of digital imagery (unsupervised and supervised Euclidean distance, nonparametric linear discriminate analysis, and edge enhancement) are evaluated. 29 figs., 19 tabs.

32386 (ENPU—82-2) Regional geophysics of the Cheviot area. Lee, M.K. (Institute of Geological Sciences, Harwell (UK). Environmental Protection Unit). Jan 1982. 47p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701045.

Regional gravity and aeromagnetic data have been used to investigate the three dimensional structure of the Cheviot igneous complex and surrounding sedimentary formations. The Bouguer Gravity Anomaly map is dominated by a large negative anomaly of -19 mgals centred over the Cheviot granite. In the surrounding area additional negative anomalies due to low density andesitic and rhyolitic lavas, and to Devonian and Lower Carboniferous sediments interfere and overlap with the anomaly due to the granite. The field due to the granite has been separated from that due to the near surface formations and interpreted in terms of a body which reaches the surface over the central part of the mapped granite outcrop and extends to a depth of about 9 km. The density of the body corresponds roughly to that of the central acid phases of the outcrop. The contacts slope outwards beneath the denser marginal granite to reach a diameter of about 35 km at 9 km depth. The aeromagnetic anomaly map is dominated by a large (400 nT) positive anomaly over the highly magnetic marginal granite and metamorphosed lavas, with a low over the weakly magnetised central granite. The results are discussed.

32387 (ENPU—82-16) Geology of the Northern part of the Strath Ossian Granite, Scotland. Henderson, W.G. (Institute of Geological Sciences, Harwell (UK). Environmental Protection Unit). Dec 1982. 22p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701044.

The Strath Ossian Granite is made up of granodiorite, dark, variable 'granodiorites' interpreted as mobilised diorite or basic material, appinite and porphyritic granodiorite. Huge rafts of psammitic metasediments occur within the mass and three fracture-zones and numerous dykes, dominantly of porphyrite, cut across it in a north-easterly direction. Granite emplacement may have occurred in stages, early batches being xenolith-rich and later ones xenolith-poor. New batches were intruded centrally, which created strong radial stresses, sufficiently strong to make room for the intrusion by forcing the metasedimentary country rocks downwards and aside.

32388 (IS-EMRRI—19, pp 13-28) Geochemistry of sulfate evaporites in Iowa. Hansen, K.S.; Richardson, S.M. Dec 1983. NTIS, PC A07/MF A01. File Number DE85011356.

In Iowa State Mining and Mineral Resources Research Institute. Final report, July 1, 1982-September 30, 1983.

Much attention has been given to structural, stratigraphic, and lithologic features of Iowa evaporites in earlier, similar studies; however, to date, no systematic baseline survey of the chemistry of these evaporites has been conducted. Such a survey, useful as an exploratory tool and a means of interpreting the depositional paleoenvironment of the region, was completed this past year. It was found that the stable isotopes of oxygen and sulfur are fractionated among dissolved and solid phases in marine environments by processes which vary in their efficiencies as functions of temperature, salinity, and biological activity. Ideally, if the variables could be separated and evaluated independently, one could gain much valuable information about an evaporite's depositional environment by examining stable isotopic patterns in a particular geologic formation.

32389 **(LBL—17473) Studies in thermo-hydro-chemical transport in porous and fractured media.** Tsang, C.F. (Lawrence Berkeley Lab., CA (USA)). May 1984. Contract AC03-76SF00098. 12p. (CONF-8405144—4). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012555.

From International groundwater symposium; Montreal, Quebec, Canada (21 May 1984).

Recent interests in the transport of toxic chemicals or radionuclides in subsurface formation raise the question of the role of processes involving the interplay of fluid flow, chemical interaction and thermal effects. The present paper reviews three examples of recent studies at Lawrence Berkeley Laboratory in this area, based on numerical modeling with a code called CPT. It is a three-dimensional chemical parcel model with a fully coupled heat and mass transport formulation for porous-fractured media with complex geometries. The three examples are: (1) injection and production of a denser cold fluid into a geothermal reservoir; (2) solute transport in a two-layered aquifer; and (3) solute transport in an aquifer with a horizontal fractured zone. The studies show a number of interesting features which may be of interest to the interpretation of field data. 4 refs., 5 figs., 3 tabs.

32390 **(PER—81) Symposium for researchers in nuclear geology - program abstracts and newsletter.** Brynard, H.J. (Nuclear Development Corp. of South Africa (Pty.) Ltd., Pelindaba, Pretoria). Jan 1984. 57p. (CONF-8311245—Absts.). NTIS (US Sales Only), PC A04/MF A01. File Number DE85780942.

From Symposium for researchers in nuclear geology; Pretoria, South Africa (23 Nov 1983).

Individual papers are indexed separately.

32391 **(SKBF-KBS-TR—83-51) GWHRT - A finite element solution to the coupled ground water flow and heat transport problem in three dimensions.** Grundfelt, B. (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). May 1983. 40p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701228.

A program package for modelling ground water flow with the Finite Element Method (FEM) is presented. The package, that comprises programs for pre- and postprocessing data for the FEM-model, has been extensively used together with the GWHRT-model developed by Roger Thunvik. Thunviks hydraulic model is one-, two- or three-dimensional. It solves the ground water pressure distribution and the temperature distribution in the modelled domain using the Finite Element Method. Also saturated/unsaturated flow can be modelled. The calculations performed in the KBS-3 study are three-dimensional steady state calculations for isothermal conditions. Such a calculation typically involves the following steps: - Generation of the finite element mesh. - Assigning boundary conditions and material properties to the domain. - Solving for the hydraulic pressure distribution. - Checking the results. - Presenting the results. In the program package HYPAC these steps are implemented. This report deals mainly with the type of calculations made in the KBS-3 study although the program package in principal can handle also other types of calculations like for instance transient saturated-unsaturated flow.

32392 **(USGS—474-319) Lithologic logs of selected exploratory and emplacement drill holes in areas 9 and 10, Nevada Test Site.** Quinlivan, W.D.; Sharps, J.A.; Ohl, J.P.; Blackmon, P.D. (Geological Survey, Denver, CO (USA)). Jun 1985. Contract AI08-76DP00474. 68p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85013263.

This report is a compilation of lithologic logs of 28 exploratory and emplacement holes in northeast Yucca Flat, Nevada Test Site, Nye County, Nevada, with emphasis on Quaternary alluvium and Tertiary volcanic units. An index map showing drill hole locations is included. 2 figs., 1 tab.

32393 **(USGS-OFR—85-47) Uranium-series dating of secondary carbonate and silica precipitates relating to fault movements in the Nevada Test Site region and of caliche and travertine samples from the Amargosa Desert.** Szabo, B.J.; O'Malley, P.A. (Geological Survey, Denver, CO (USA)). 1985. Contract AI08-78ET44802. 15p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013083.

Fault associated secondary carbonate and opal samples from the Nevada Test Site area together with travertine samples from the Amargosa Desert were dated by the uranium-series disequilibrium method. Analyses of secondary carbonate samples from Yucca Mountain and from Crater and Yucca Flats yielded minimum ages for the last significant displacements of associated faults between 27,000 and 219,000 years. Dating results of an opaline carbonate rock sample from a fault on the east side of Yucca Mountain indicate that the age of the deposit is greater than 360,000 years. Two dates of travertine vein samples show that spring discharge was occurring before about 360,000 years ago in the Kinney area of the Amargosa Desert. Ages obtained for travertine laminae from the Furnace Creek Wash area suggest that significant movement along this low-angle fault occurred more than 132,000 years ago. 5 refs., 1 fig., 4 tabs.

32394 **(CEA-CONF—7538) Assessment of seismic hazard for NNP sites in France analysis of several aftershocks of November 8, 1983, Liege earthquake.** Mohammadioun, B.; Mohammadioun, G.; Bresson, A. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. d'Analyse de Surete). Mar 1984. 19p. (CONF-8403180—1; DAS—80). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751317.

From OTAN conference on seismic activity in Western Europe; Brussels, Belgium (20 Mar 1984).

Current French practice for assessing seismic hazard on the sites of nuclear facilities is outlined. The procedure calls for as rich and varied an assortment of actual earthquake recordings as can be procured, including earthquakes in France itself and in nearby countries, recorded by the CEA/IPSN's own staff. Following the November 8, 1983, Liege earthquake, suitably equipped, temporary recording stations were set up in the epicentral area in order to record its aftershocks. Ground motion time histories and response spectra were computed for several of these, and a quality factor Q was derived from these data for the most superficial sedimentary layers of the area. The values obtained show reasonable agreement with ones found for similar materials in other regions.

32395 **(INS-R—308) Evaluation of the alpha-track method of geothermal prospecting.** Whitehead, N.E. (Department of Scientific and Industrial Research, Lower Hutt (New Zealand). Inst. of Nuclear Sciences). Sep 1982. 4p. (DSIR-GC—NEW5). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701460.

Notes on a workshop, held 30 August 1982, at the Geothermal Institute, Auckland.

A discussion between N.E. Whitehead, A. Koga, M. Cox and S. Taguchi, on evaluation of the alpha-track method of geothermal prospecting concluded that final evaluation of the method must await extensive drilling in fields where the method has been used. The local lithology is very important, and produces different backgrounds which must be allowed for. Various work has now shown some overall correlation between radon measurements and 300 m temperatures; radon and aeromagnetic surveys; radon surveys; radon and low sensitivity; and radon and self-potential measurements. Overall high zones of radon are not seen in all locations, but mainly in regions of high permeability, or near faults or shatter zones.

32396 **(N—85-17383) Seismic waves.** De, S. (National Research Inst., Bankura (India)). Nov 1984. 22p. SVIC, Code 5804, Naval Research Lab., Washington, DC 20375.

In Shock and Vibration Information Center, the shock and vibration digest, Vol. 16, No. 11, 3-24 p. (N—85-17382 08-39).

Various aspects of the propagation of elastic waves on Earth were examined. Mathematical methods, waves due to explosion and oscillation of the Earth, seismic prospecting, seismic risk, ground motion and structures, and mechanisms and prediction of earthquakes are discussed.

32397 (PER—81, pp 37-39) **Review of recent developments in radiometric calibration facilities.** Corner, B. (University of the Witwatersrand, Johannesburg (South Africa). Bernard Price Inst. of Geophysical Research). Jan 1984. NTIS (US Sales Only), PC A04/MF A01. File Number DE85780942. (CONF-8311245—Absts.).

From Symposium for researchers in nuclear geology; Pretoria, South Africa (23 Nov 1983).

Two new developments concerning radiometric calibration facilities are described in this presentation. The first is the result of the international programme for the monitoring and cross-reference of existing calibration facilities, sponsored by the International Atomic Energy Agency. The second development that is discussed concerns the accuracy of the stripping ratios derived at Pelindaba and has important implications for in situ assaying.

32398 (UCID—20421-Vol.1) **Seismic hazard characterization of the eastern United States. Volume 1. Methodology and results for ten sites.** Bernreuter, D.L.; Savy, J.B.; Mensing, R.W.; Chen, J.C.; Davis, B.C. (Lawrence Livermore National Lab., CA (USA)). Apr 1985. Contract W-7405-ENG-48. 633p. NTIS, PC A99/MF A01 - GPO; GPO Dep. File Number TI85013208.

The objectives are: (1) to develop a seismic hazard characterization methodology for the region east of the Rocky Mountains; and (2) the application of the methodology to ten sites to assist the NRC staff in their assessment of the implications in the clarification of the US Geological Survey (USGS) position on the Charleston earthquake. The fundamental characteristic of the methodology used in SHC consists in using opinions for all the input data. The most important improvement over the methodology used in the SEP leads to an estimate of the distribution of the hazard rather than just point estimates. An important aspect of eliciting expert opinion consists in holding feedback meetings in order to fine tune the methodology and the input data. Estimates of the hazard peak ground acceleration and spectral velocity at ten representative sites are discussed including a sensitivity analysis and a comparison with the SEP results at four sites. The methodology and the data were analyzed by a panel of experts in a formal peer review process to identify the weak points in the analysis and recommend improvements. The results were also compared with results obtained by using other methodologies such as the "Historical" method and other zonation and seismicity data provided by USGS. 23 refs.

32399 (UCID—20421-Vol.2) **Seismic hazard characterization of the eastern United States. Volume 2. Questionnaires.** Bernreuter, D.L.; Savy, J.B.; Mensing, R.W.; Chen, J.C.; Davis, B.C. (Lawrence Livermore National Lab., CA (USA)). Apr 1985. Contract W-7405-ENG-48. 372p. NTIS, PC A16/MF A01 - GPO ; GPO Dep. File Number TI85013209.

This report contains the information given to the experts of the Seismicity panel and the Ground Motion Model Panel. This information includes copies of the six questionnaires sent to the panel members. The responses to questionnaires Q1, Q2, Q3, and Q4 are not specifically given in this volume since they were not final. The reader may find a detailed description of these responses in our interim report. In addition, questionnaire Q6, which is the feedback questionnaire to the Ground Motion Panel contains a complete summary of the responses to the previous questionnaire to the Ground Motion Panel.

REFER ALSO TO CITATION(S) 29910, 29911, 29952, 29953, 29967, 29971, 29972, 29991, 30019

32400 (BMI/OCRD—21) **Evaluation of technology for large- and small-diameter boreholes to characterize crystalline rock.** (Earth Technology Corp., Long Beach, CA (USA)). May 1985. Contract AC02-83CH10139. 230p. NTIS, PC A11/MF A01; GPO Dep. File Number DE85012821.

Testing methods that have been used in large- and small-diameter boreholes (152 and 76 mm [6 and 3 in.]) were evaluated on their ability to characterize crystalline rocks. The methods evaluated included in-hole geomechanical, geophysical, and geohydrologic techniques and associated laboratory core tests; specific emphasis was on techniques that might be used in a field characterization program involving a small number of deep (up to 1500 m [5000 ft]) boreholes. Each technique was evaluated with regard to its effectiveness and limitations, applicability to the acquisition of data for anticipated rock conditions, and adequacy for assessing the required rock/hydrologic characteristics. Many pertinent case histories that helped to assess applicability were reviewed. A principal objective of the evaluations was to assess whether the techniques would be equally useful in both large- and small-diameter boreholes. Of the techniques evaluated, most are suitable for use in both large- and small-diameter boreholes. Borehole logging, hydrologic testing, and core-testing techniques provide suitable results in both borehole diameters. Geomechanical testing techniques provide suitable data in smaller diameter boreholes and have been designed for application at primarily shallow depths. The results of this study will be of use to the Office of Crystalline Repository Development (OCRD) in determining to what degree it is appropriate to use drilling, sampling, and testing techniques in small-diameter boreholes as opposed to large-diameter methods, while at the same time collecting adequate data for characterizing crystalline rock environments for potential use as a high-level radioactive waste repository. Additionally, further developmental work and specific testing techniques are recommended.

32401 (ENPU—81-10) **Porosity measurements of crystalline rocks by laboratory and geophysical methods.** Alexander, J.; Hall, D.H.; Storey, B.C. (Institute of Geological Sciences, Harwell (UK). Environmental Protection Unit). Dec 1981. 45p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701042.

Porosity values of igneous and metamorphic crystalline rocks have been determined from core samples taken at specific depths from Altnabreac, by a combination of laboratory and geophysical techniques. Using resaturation and mercury injection methods in three laboratories within I.G.S., porosity values have been derived and the effect of variations in the measuring techniques and results obtained have been compared. Comparison of inter-laboratory porosity values illustrates that systematic errors are present, resulting in higher porosity values for samples subjected to re-testing. This is considered to be caused by the variable nature of the initial samples combined with the inability to completely dry or resaturate samples during a second testing. Geophysical techniques for determining in situ porosity using the neutron log have been carried out in borehole ALA. The neutron log has been calibrated with laboratory derived porosity values and an empirical formula derived enabling porosity values to be ascribed throughout the logged borehole ALA. Comparison of the porosity results from Altnabreac with crystalline samples elsewhere in America, Europe and the U.K. suggest that porosities at Altnabreac are lower than average. However, very few publications concerned with water movement in crystalline areas actually state the method used.

32402 (ENPU—82-10) **Analysis of in situ stress measurement by hydrofracturing, and the use of the borehole televiewer at Altnabreac.** McEwen, T.J. (Institute of Geological Sciences, Harwell (UK). Environmental Protection Unit). Oct 1982. 35p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701043.

In situ stress measurement by hydrofracturing has been attempted in one deep borehole at Altnabreac in the Strath Halladale Granite. Although the results obtained were inconclusive, the hydrofracturing technique has been shown to be relatively simple to use in rocks of low permeability, and in addition the interpretation of the results is straightforward. The calculated in situ stresses exhibit a high horizontal stress ratio with the vertical stress being the intermediate stress. The borehole televiewer has been used to produce an acoustic picture of the borehole wall and is shown to be a valuable geophysical logging method for fracture analysis. The limitations of this technique are explained, and the results from the televiewer are compared with those derived from other methods of fracture analysis.

32403 (LA—10369-MS) Iron and manganese in oxide minerals and in glasses: preliminary consideration of Eh buffering potential at Yucca Mountain, Nevada. Caporuscio, F.A.; Vaniman, D.T. (Los Alamos National Lab., NM (USA)). Apr 1985. Contract W-7405-ENG-36. 31p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85011892.

The tuffs of Yucca Mountain at the Nevada Test Site are currently under investigation as a possible deep burial site for high-level radioactive waste disposal. One of the main concerns is the effect of oxidizing groundwater on the transport of radionuclides. Rock components that may affect the oxygen content of groundwater include Fe-Ti oxides, Mn oxides, and glasses that contain ferrous iron. Some phenocryst Fe-Ti oxides at Yucca Mountain are in reduced states, whereas groundmass Fe-Ti oxides have been oxidized to hematite, rutile, and pseudobrookite (Fe^{3+} -bearing phases) exclusively. Estimates of Fe^{2+} -bearing oxides indicate that less than 0.33 vol% phenocrysts is available to act as solid buffering agents of Eh. Of this percentage, significant amounts of Fe-Ti oxides are isolated from effective interaction with groundwater because they occur in densely welded, devitrified tuffs that have low interstitial permeability. Manganese oxides occur primarily along fractures in the ash-flow tuffs. Because the Mn oxides are concentrated along the same pathways (fractures) where transport has occurred in the past, these small volume percentages could act as buffers. However, the oxidation states of actual Mn-oxide phases are high (Mn^{4+}), and these minerals have virtually no potential for reducing groundwater Eh. Manganese oxides may even act as oxidizing agents. However, regardless of their poor capabilities as reducing agents, the Mn oxides could be important as sorbents of heavy metals at Yucca Mountain. The lack of accessible, pristine Fe-Ti oxides and the generally high oxidation states of Mn oxides seem to rule out these oxides as Eh buffers of the Yucca Mountain groundwater system. Reduction of ferrous iron within glassy tuffs may have some effect on Eh, but further study is needed. At present it is prudent to assume that minerals and glasses have little or no capacity for reducing oxygen-rich groundwater at Yucca Mountain. 25 refs., 3 figs., 12 tabs.

32404 (SAND—85-7166) WIPP horizon in situ permeability measurements. Final report. Peterson, E.; Lagus, P.; Brown, J.; Lie, K. (S-Cubed, La Jolla, CA (USA)). Jan 1985. Contract AC04-76DP00789. 102p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE85012687.

Eighteen gas permeability tests were conducted at the Waste Isolation Pilot Plant (WIPP) facility horizon in southeastern New Mexico. The objectives of the twelve Phase I tests were to determine: the permeability and porosity of the competent salt, the permeability variation with distance from the mined surface, and the influence of the interspersed clay and anhydrite seams on the measured permeability values. Six short duration "order-of-magnitude" permeability tests were performed as Phase II of this project. These tests were used to provide confirmation of the Phase I test results. Two types of test were performed. In one test the downhole pressure was maintained at an approximate constant value and the resulting flow measured. In the second, the test region was pressurized, then shut-in, and the pressure decay subsequently monitored. The resulting data were then used to infer permeability and porosity values. The test system and test technique used for the twelve Phase I tests were designed to evaluate formations having permeability to porosity ratios as low as 10^{-4} darcy. This downhole measurement system consisted of a dual packer assembly which isolated a test interval and adjacent guard interval. During a test, the test interval pressure, temperature, and flow (as well as the guard interval pressure) were measured. Use of the guard interval was critical to interpreting data obtained in these low permeability formations. Permeability and porosity values were inferred from the measured data using one-dimensional and two-dimensional axisymmetric solutions to equations describing gas flow through an isotropic porous medium. In those cases, where the analytical/numerical solutions failed to describe the measured response, additional testing should be performed to evaluate the formation characteristics.

32405 (SKBF-KBS-TR—79-11) Interpretation of permeability in an underground rock structure. Lindblom, U.; Norlen, A.; Granero, J.; Adolfsson, K. (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). Feb 1979. 32p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701227.

The field study described in this paper was undertaken in a granitic rock mass. A large gas storage plant is excavated 130 m below the rock surface. Above the rock chambers, a system of closely spaced horizontal drillholes is overpressurized with water. Water pressures and water losses from this drillhole system, as well as gas pressure and water pumping from the rock chambers is closely controlled. Also the free groundwater surface is recorded in drillholes at the surface. The pressure situation in the rock mass above the caverns is measured. Pressure readings are taken in 2 m sections of two long drillholes, one vertical and one inclined 45 degree. Water losses in 2 m sections along the drill holes were controlled. A very sensitive monitoring system for water losses was developed, capable of recording hydraulic conductivities well below 10^{-11} m/s. Potential flow nets constructed under the assumption of a homogenous, isotropic rock permeability pointed at an average conductivity of 1,1 times 10^{-8} m/s for the rock as a whole. The precision determinations of water losses were interpreted as isotropic permeabilities of a porous medium. In the vertical drillhole, an average conductivity of 1,0 times 10^{-8} m/s was determined, whereas the inclined hole showed a conductivity of 4,2 times 10^{-8} m/s. However, if the results from the most fractured upper sections of this drillhole are omitted, then the average conductivity is 2,0 times 10^{-8} m/s. Thus, the investigation shows that in this rock mass it is possible to predict gross conductivity from packer tests in drillholes. The rock mass can then be interpreted as a porous medium. However, better than standard quality and precision is required for packers and reading equipment. The piezometric pressure readings confirmed that the overall flow situation was correctly assumed.

32406 (UCID—20351) Logging of post-test and CCH record core samples for the Spent Fuel Test-Climax. Thorpe, R.; Qualheim, B. (Lawrence Livermore National Lab., CA (USA)). Feb 1985. Contract W-7405-ENG-48. 113p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE85013036.

Over 1300 ft of core obtained from 50 boreholes are described, with emphasis on the nature and orientations of geologic discontinuities in the Climax Stock. Although most of the core was not oriented with respect to global coordinates, approximate orientations of planar features, such as joints, veins, and sheer fractures, were obtained by taking core measurements relative to a set of low-angle joints found throughout the rock mass. The method for determining the approximate core orientation is described in detail, and the associated uncertainty is discussed. A graphic fracture log for each hole is provided, along with the computer code used to generate it.

32407 (UCRL—53632) Field investigation of keyblock stability. Yow, J.L. Jr. (Lawrence Livermore National Lab., CA (USA)). Apr 1985. Contract W-7405-ENG-48. 247p. NTIS, PC A11/MF A01; 1; GPO Dep. File Number DE85012834.

Discontinuities in a rock mass can intersect an excavation surface to form discrete blocks (keyblocks) which can be unstable. This engineering problem is divided into two parts: block identification, and evaluation of block stability. One stable keyblock and thirteen fallen keyblocks were observed in field investigations at the Nevada Test Site. Nine blocks were measured in detail sufficient to allow back-analysis of their stability. Measurements included block geometry, and discontinuity roughness and compressive strength. Back-analysis correctly predicted stability or failure in all but two cases. These two exceptions involved situations that violated the stress assumptions of the stability calculations. Keyblock faces correlated well with known joint set orientations. The effect of tunnel orientation on keyblock frequency was apparent. Back-analysis of physical models successfully predicted block pullout force for two-dimensional models of unit thickness. Two-dimensional (2D) and three-dimensional (3D) analytic models for the stability of simple pyramidal keyblocks were examined. Calculated stability is greater for 3D analyses than for 2D analyses. Calculated keyblock stability increases with larger in situ stress magnitudes, larger lateral stress ratios, and larger shear strengths. Discontinuity stiffness controls block displacement more strongly than it does stability itself. Large keyblocks are less stable than small ones, and stability increases as blocks become more slender. Rock mass temperature decreases reduce the confining stress magnitudes and can lead to failure. The pattern of stresses affecting each block face explains conceptually the occurrence of pyramidal keyblocks that are truncated near their apex.

32408 (UCRL—92229) **Preliminary evaluation of alterant geophysical tomography in welded tuff.** Ramirez, A.L.; Daily, W.D. (Lawrence Livermore National Lab., CA (USA)). Feb 1985. Contract W-7405-ENG-48. 11p. (CONF-850671—18). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012971.

From 26. U.S. symposium on rock mechanics; Rapid City, SD, USA (26 Jun 1985).

The ability of alterant geophysical tomography to delineate flow paths in a welded tuff rock mass has been preliminarily evaluated based on the results of a field experiment. Electromagnetic measurements were made before, during and after a water-based, dye tracer flowed through the rock mass. Alterant geophysical tomographs were generated and compared with independent evidence - borescope logs, neutron logs and dyed rock samples. Anomalies present in the tomograph match the location and orientation of fractures mapped with a borescope. The location of tracer-strained fractures coincides with the location of some image anomalies; other geophysical anomalies exist where tracer-strained fractures were not observed, perhaps due to poor core recovery. Additional drilling to locate stained flow paths and other experiments are planned so that the applicability of the technique can be further evaluated. 7 refs., 5 figs.

32409 (DOE/ER/13259—T1) **Thermally induced chemical migration: a natural analog approach. Progress report, September 1984-September 1985.** Papike, J.J. (South Dakota School of Mines and Technology, Rapid City (USA)). 26 Apr 1985. Contract FG01-84ER13259. 51p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85012308.

The objective has been to understand the extent and mechanisms of chemical migration in the broadest sense, i.e., over a range of temperatures and in diverse geologic media. Pegmatites are genetic links between "normal granites" and hydrothermal systems. At some stage in their crystallization history with falling temperature (and sometimes pressure) an aqueous fluid phase exsolves and coexists with a silicate melt. Little is known about the composition of these fluids, the element partitioning behavior between fluid and silicate melt, and how these fluids interact with previously crystallized granite. It is these fluids that "leak" out of the pegmatites and form the dispersion halos that we are studying. Research progress is reported in the following areas: (1) fluid evolution in the Notch Peak, Utah, metamorphic aureole; (2) tourmaline as a recorder of pegmatite evolution; (3) feldspar as a recorder of pegmatite evolution; (4) the distribution of boron among pegmatite minerals and the mass balance of boron in granitic pegmatite systems; (5) crystal chemical aspects of Li, Pb, and Cs partitioning between coexisting muscovite and biotite; (6) apatite as a recorder of pegmatite petrogenesis; (7) mineralogy and REE geochemistry of an S-type granite; (8) exomorphic aureoles as indicators of pegmatite fluid composition; (9) anatomy of a layered granite pluton; and (10) fractionation within a granitic system. 32410 (NP—5900966) **Geological study on the shallow water.** (Korean Inst. of Energy and Resources, Seoul (Republic of Korea)). 1983. 69p. (In Korean). NTIS (US Sales Only), PC A04/MF A01. File Number DE85900966.

For the compilation of a submarine geological map of Korean continental shelf, a marine geological investigation was made as one of annual projects of KIER during 1982. A total of 1125 line-Km of geophysical survey and 183 samples of sea-floor sediments were taken on the continental shelf from Cheju strait to Geomun Island, off the southern part of Korean Peninsula; 33°30'-34°30'N, 127°00'-127°30'E. According to the results from the interpretation of geophysical data and the analyses of samples, the recent sediments overlying Cretaceous volcanic basement can be divided into two depositional sequences by a local unconformity. Young sediment cover, with the maximum thickness of 30m, is composed of fine sediments which might be derived from Seomjin River. These young sediments are distributed only at the northern part of the project area and are named here Seomjin deposit. Depositional sequence under the local unconformity, is composed of coarser sediments than Holocene muddy sediments and widely distributed on the study area. Especially, at the zone of 110 +- 10 m in water depth, the superficial sediments have negative values in skewness and mean phi values of 1 to 3 phi. The similarities of characteristics of beach sand in textural parameter and its internal depositional structure suggest that the scarp with the height of 20m was a beach zone during the last glacial stage. 14 refs., 9 figs., 5 tabs.

32411 **"Pycnobathic" currents over the upper continental slope.** Csanady, G.T. (Woods Hole Oceanographic Institution, Woods Hole, MA 02543). *Journal of Physical Oceanography;* **15**: No. 3, 306-315(Mar 1985). Contract AC02-79EV10005.

The dynamic interaction of a sloping seafloor with along-isobath density variation is calculated for cases involving a sharp pycnocline and a surface-to-bottom front. Pycnocline depth is supposed to vary in the alongshore direction only, over a slopping plane seafloor, the bottom trace of the surface-to-bottom front is supposed to cut across isobaths. The calculations are diagnostic and make use of linearized equations with a linear bottom friction term.

32412 **Sea surface temperatures computed by a simple ocean mixed layer coupled to an atmospheric GCM.** Meehl, G.A.; Washington, W.M. (National Center for Atmospheric Research, Boulder, CO 80307). *Journal of Physical Oceanography;* **15**: No. 1, 92-104(Jan 1985).

An ocean mixed layer with fixed depth (50 m) is coupled to a global atmospheric general circulation model (GCM). The mixed layer is a simple slab that allows for seasonal heat storage but has no dynamics (advection or diffusion). The sea surface temperatures generated by the model are compared to observations for January and July. The overall simulation of ocean temperature is reproduced even with this simple ocean model. However, there are important discrepancies. Because of the lack of dynamics, the tropical upwelling regions are too warm in the model. Most Northern Hemisphere midlatitude ocean areas are too cool during summer due to the absence of shallowing of the mixed layer at that time of year.

32413 **Cyclonic eddies in the eastern Gulf of Mexico.** Vukovich, F.M.; Maul, G.A. (Research Triangle Institute, Research Triangle Park, NC 27709). *Journal of Physical Oceanography;* **15**: No. 1, 105-117(Jan 1985).

Cold-domed cyclonic eddies juxtaposed to the cyclonic shear side of the Gulf Loop Current are observed in simultaneously obtained hydrodgraphic, current meter mooring, and satellite infrared data. The cyclones are initially observed in the satellite data as cold perturbations on the northern extreme of the current and grow either into a cold tongue or a quasi-stable meander off the Dry Tortugas, Florida. Area shipboard surveys show closed isopleths of temperature and salinity, and surface geostropic current speeds relative to 1000 db are in excess of 100 cm s^{-1}. The diameter of the cold domes varied from 80 to 120 km. Separation of large anticyclonic rings is always observed to be preceded by cylonic eddies in the transition zone between Campeche Bank and the West Florida Shelf, but only on the eastern side. Not every cyclonic eddy off Dry Tortugas is associated with the separation of an anticyclonic ring; some are eroded away by the Florida Current, but they have never been observed in 10 years of satellite data to advect eastward through the Straits of Florida.

32414 **(AD-A—152027/9/XAB) Very Large Array observations of coronal loops and related observations of solar-type stars. Annual scientific report, 1 January-31 December 1984.** Lang, K.R. (Tufts Univ., Medford, MA (USA). Dept. of Physics). 29 Jan 1984. 118p. NTIS, PC A06/MF A01.

Observations of solar-active regions with the Very Large Array (V.L.A.) led to a new understanding of the origin and prediction of the solar bursts that disrupt communication systems and interfere with high-flying aircraft. The V.L.A. was used to delineate the temperature and magnetic structure at different heights in coronal loops, and the magnetic field strength was also determined. Much of the visible solar disk was resolved at 20-cm wavelength with 2.6-in. angular resolution. Snapshot maps at intervals of 3 seconds were used to specify changes in the temperature and the magnetic field before and during solar bursts. These snapshot maps were used to investigate the flow of plasma within coronal loops during solar bursts. Postflare loop systems were similarly investigated. These V.L.A. observations provided new information on coronal heating and emerging magnetic loops that may trigger the emission of solar bursts.

32415 **(CBPF-NF—002/83) Comparison of C-jet events with accelerator results.** Arata, N. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 10p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701438.

A comparison is made of cosmic-ray induced C-jet events with accelerator results, mainly from the CERN ISR and the CERN SPS pp sub(-) Collider. The distributions of energy, emssion angle and transverse momentum of γ-rays are discussed. Importance of the study on such events with high multiplicity, large p sub(T), jet structure and association of new particles is emphasized.

32416 **(CBPF-NF—010/83) Eternal universe.** Novello, M.; Heintzmann, H. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 10p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701436.

A new generalized solution of Maxwell-Einstein equations (which are non-minimally coupled) which leads to some fascinating aspects of the Universe is presented. The Cosmos has no singularity due to the coupling of longitudinal electromagnetism with space-time. It contains the Milne-Schucking cosmos as a limiting case. This model contains a free parameter (the longitudinal electromagnetic field) which allows one to fix the density of highest compression of the Cosmos. Alternatively the parameter allows one to adjust our cosmos to the presently observed Hubble constant and the deceleration parameter. The model seems to be a viable candidate for our real cosmos as it allows one to extend the time scale of the Universe to arbitrarily large values i.e., it is able to provide the necessary time scale for the origin of life. It is speculated that the entropy is finite but intelligence in the Universe may be infinite.

32417 **(CBPF-NF—012/83) Stability of the Einstein universe.** Soares, I.D. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701437.

It is shown sthat the Einstein Universe is stable by a large class of exact perturbations, which are made starting from a detailed exam of the topology of the model, and which include perturbations of the type considered by Lemaitre. The problem is reduced to the one-dimensional motion of a particle, in a potential well whose minimum corresponds to the configuration of the Einstein Universe.

32418 **(CBPF-NF—018/83) Evolution of pulsarmagnetism by virtue of a Faraday dynamo mechanism.** Heintzmann, H.; Novello, M. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701434.

The evidence that radio-pulsars are slowed-down and Roentgen - pulsars accelerated predominantly by magnetic torques is now very strong. Angular momentum is transferred away from the neutron star to the velocity-of-light cylinder or from the Alfven - cylinder down to the neutron star by means of a magnetic spring the physical origin of which is an appropriate current flowing along the magnetic field lines. As this current must be closed at the neutron star's surface and no Hall-Field can be built-up a Faraday dynamo mechanism is set up. It is pointed out that this mechanism could switch -off a radio pulsar or turn-on a Roentgen pulsar. Many disconcerting pulsar observations could thus be explained, if radio pulsars can be reactivated in the galactic plane by means of accretion of matter in dense clouds and if Roentgen pulsars must first create a sufficiently strong magnetic field to function as a regularly pulsed emitter.

32419 **(DOE/ER/10753—5) Solar variability observed through changes in solar figure and mean diameter.** Hill, H.A. (Arizona Univ., Tucson (USA). Dept. of Physics). 24 May 1985. Contract AC02-80ER10753. 18p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012857.

A program to monitor solar luminosity variations through diameter measurements has been operation at SCLERA since 1981. The solar diameter is currently measured at multiple angles from the equator. Measurements at these different angles have the advantage that, not only can the solar oblateness be accurately measured, but, also, systematic errors, introduced by atmospheric refraction, can be reduced to a minimum. The primary emphasis during the last year has been on data analysis and interpretation. An extension of theoretical work relevant to the relationship between the solar diameter and luminosity for long-period oscillations has been extended to include 160 min period oscillations, and several tests have been completed. An absolute calibration system for the telescope field has been constructed and is being tested. A review of this work is presented.

32420 **(IFT-P—03/83) Compactification of Friedmann's hyperbolic model.** Fagundes, H.V. (Instituto de Fisica Teorica, Sao Paulo (Brazil)). Apr 1983. 6p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701000.

A compact hyperbolic 3-manifold is substituted for the infinite space H^3, as space section of Friedmann's cosmological model of negative curvature. Some observational consequences are briefly analyzed.

32421 **(INIS-mf—9502) Groups and clusters of galaxies. Radio and X-ray studies.** Bijleveld, W. (Rijksuniversiteit Leiden (Netherlands)). 9 May 1984. 107p. NTIS (US Sales Only), PC A06/MF A01. File Number DE85780919.

Includes Dutch summary.

In this thesis, a correlative study is performed with respect to the radio and X-ray parameters of galaxy clusters and groups of galaxies (Msub(v)-Psub(1.4); Msub(v)-Lsub(x); Lsub(x)-Psub(1.4); R-Msub(v) correlations). Special attention is paid to correlations with cD and elliptical galaxies. It is concluded that in rich clusters massive cD galaxies form; massive galaxies are able to bind a large X-ray halo; strong X-ray emitters fuel their central radio sources at a high rate; the total gas content of groups is low, which implies that the contribution of groups to the total matter density in the universe is small.

32422 **(IPNO-TH—84-3) Equation of state of hot dense matter.** Vautherin, D. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). Mar 1983. 11p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751320.

The approaches which have been used so far to calculate the equation of state of hot dense matter are briefly reviewed.

32423 (IPNO-TH—84-4) **Thomas-Fermi equation of state of hot dense matter.** Suraud, E. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). Nov 1983. 7p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751321.

We report on the results of some Thomas-Fermi calculations of the equation of state (EOS) of Supernovae Matter. These calculations involve a complete solution of the Thomas-Fermi equations using a procedure derived from the imaginary time step method of reference [I].

32424 (JINR-D—2,-13-83-689, pp 47-59) **Possibility of generating gravitational waves of optical SHF- and UHF-ranges using intense coherent radiation and on the detection of waves for a number of gravity theories.** Pisarenko, V.G. (AN Ukrainskoj SSR, Kiev. Inst. Geofiziki). 1983. (In Russian). NTIS (US Sales Only), PC A08/MF A01. File Number DE85780874. (CONF-8306179—).

From Working meeting on problems of radiation and detection of gravitational waves; Dubna, USSR (7 Jun 1983).

The problem of generating gravitational waves of optical, SHF and UHF-ranges using coherent radiation and detecting waves for a number of gravitation theories is considered. Gravitational radiation generation in a crystal to account for polariton effects in the course of propagation of electromagnetic waves and the absorption zone of the latter is described. The calculation of the expected power absorbed by a concrete variant of the gravitational wave detector on eleastically bound masses in the proper detector reference system is given. Main effects of non-linear optics manifested at high densities of the electromagnetic radiation in the working environment, self-focusing and generation of combination and multiple harmonics are reported. By the method of holographic correction of intense radiation harmful self-focusing effects in the environment are eliminated. The expected differences of effects of the hertz gravitational experiment in various gravitation theories concerning GRT are given.

32425 (JINR-D—2,-13-83-689, pp 94-97) **Circular amplification method for light wave signal in a gravitational wave detector.** Basha, S.G.; Lyablin, M.V.; Plis, Yu.A. 1983. (In Russian). NTIS (US Sales Only), PC A08/MF A01. File Number DE85780874. (CONF-8306179—).

From Working meeting on problems of radiation and detection of gravitational waves; Dubna, USSR (7 Jun 1983).

Two cyclic amplification modes in a three-mirror resonator of a signal light wave generated as a result of gravitational radiation parametric transformation are considered in the paper: the mode of complete locking of the signal wave in the resonator and partial locking mode. The calculation shows that the first wave amplification method is considerably more effective than the second method under all values of the complete amplification increment for a cycle.

32426 (JINR-D—2,-13-83-689, pp 157-168) **Seismic detection in the pulsar frequency range.** Dolgikh, G.I.; Kopvillem, U.Kh.; Mezikov, S.M. (AN SSR, Vladivostok. Dal'navostochnyh Nauchnyj Tsentr). 1983. (In Russian). NTIS (US Sales Only), PC A08/MF A01. File Number DE85780874. (CONF-8306179—).

From Working meeting on problems of radiation and detection of gravitational waves; Dubna, USSR (7 Jun 1983).

Data on seismic investigations obtained by means of a 105-meter optical interferential deformometer in the Primore in 1977 are discussed. The data on changes in seismic signals with periods T1=0.127s, T2=0.585s and T3=0.325s for 24-hours are presented. The periods T1 and T2 are equal respectively to half-periods of CP 0950 and CP 1133 pulsars measured in a radiofrequency range. The minimum and maximum relative value of seismic signal amplitudes with the T1 and T2 period is shown. Arguments in favour of a possible explanation of physical nature of T1, T2 and T3 seismic signals by means of gravitational waves generated by pulsars are presented.

32427 (LA-UR—85-1742) **Cosmic-ray-produced gamma rays in planetary surfaces.** Reedy, R.C. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 5p. (CONF-850507—26). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012750.

From International conference on nuclear data for basic and applied science; Santa Fe, NM, USA (13 May 1985).

A major priority of future NASA planetary missions is the determination of the elemental compositions of solar system objects. Gamma-ray spectroscopy will probably be used soon to determine the surface compositions of Mars and other solar system objects. Neutrons induced by the cosmic rays produce many of the important γ-ray lines that escape from planets. Some measurements of the γ rays produced by neutrons and protons with various energies have recently been made. However, many more nuclear measurements are still needed to plan for and to interpret the results from future planetary missions. Excitation functions for the production of γ-ray lines by both neutrons and protons are needed in calculating the fluxes of γ rays in and above a planet's surface. Thick-target irradiations with high-energy protons have simulated the production of γ rays by the cosmic rays, and more simulations are planned. 8 refs.

32428 (N—85-16729) **Galactic gamma-ray distribution: implications for galactic structure and the radial cosmic ray gradient.** Harding, A.K.; Stecker, F.W. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Nov 1984. 28p. (NASA-TM—86173). NTIS, PC A03/MF A01.

The radial distribution of gamma ray emissivity in the Galaxy was derived from flux longitude profiles, using both the final SAS-2 results and the recently corrected COS-B results and analyzing the northern and southern galactic regions separately. The recent CO surveys of the Southern Hemisphere, were used in conjunction with the Northern Hemisphere data, to derive the radial distribution of cosmic rays on both sides of the galactic plane. In addition to the 5 kpc ring, there is evidence from the radial asymmetry for spiral features which are consistent with those derived from the distribution of bright HII regions. Positive evidence was also found for a strong increase in the cosmic ray flux in the inner Galaxy, particularly in the 5 kpc region in both halves of the plane.

32429 (N—85-17763) **Nonthermal radio emission and the HR diagram.** Gibson, D.M. (Joint Inst. for Lab. Astrophysics, Boulder, CO (USA)). Jan 1985. 5p. NTIS, PC A12/MF A01.

In NASA, Goddard Space Flight Center, the origin of non-radiative heating/momentum in hot stars, 70-74 p. (N—85-17755 08-88).

Perhaps the most reliable indicator of non-radiative heating/momentum in a stellar atmosphere is the presence of nonthermal radio emission. To date, 77 normal stellar objects have been detected and identified as nonthermal sources. These stellar objects are tabulated herein. It is apparent that non-thermal radio emission is not ubiquitous across the HR diagram. This is clearly the case for the single stars; it is not as clear for the binaries unless the radio emission is associated with their late-type components. Choosing to make this association, the single stars and the late-type components are plotted together. The following picture emerges: (1) there are four locations on the HR diagram where non-thermal radio stars are found; (2) the peak incoherent 5 GHz luminosities show a suprisingly small range for stars within each class; (3) the fraction of stellar energy that escapes as radio emission can be estimated by comparing the integrated maximum radio luminosity to the bolometric luminosity; (4) there are no apparent differences in L sub R between binaries with two cool components, binaries with one hot and one cool component, and single stars for classes C and D; and (5) The late-type stars (classes B, C, and D) are located in parts of the HR diagram where there is reason to suspect that the surfaces of the stars are being braked with respect to their interiors.

32430 (N—85-17764) **X-ray activity in pre-main sequence stars.** Feigelson, E.D. (Pennsylvania State Univ., University Park (USA)). Jan 1985. 6p. NTIS, PC A12/MF A01.

In NASA, Goddard Space Flight Center, the origin of nonradiative heating/momentum in hot stars, 75-80 p. (N—85-17755 08-88).

X-ray findings and their interpretation with respect to winds and surface activity of pre-main sequence stars are summarized. Some recent optical and radio observations supporting the X-ray evidence for giant flares on PMS stars are discussed. The unusual properties of PMS/T Tauri stars were for many years primarily attributed to their strong winds. Numerous lines of evidence are outlined herein indicating that PMS stars also have enhanced surface activity, including extremely strong individual flares.

32431 (N—85-17779) Bipolar flows and X-ray emission from young stellar object. Uchida, Y.; Shibata, K. (Tokyo Astronomical Observatory (Japan)). Jan 1985. 8p. NTIS, PC A12/MF A01.

In NASA, Goddard Space Flight Center, the origin of nonradiative heating/momentum in hot stars, 169-176 p. (N—85-17755 08-88).

Production of both the large scale CO bipolar flows and the small scale optical bipolar jets from the star-forming regions is given interpretation in terms of a magnetic mechanism related to accretion model. It is shown by an axisymmetric 2.5-dimensional simulation that the large scale cold bipolar flow may be produced in the relaxation of the magnetic twist which is created by the rotational winding-up of the magnetic field in the contracting disk. In contrast, the small scale warm bipolar jets may be driven by the recoiling shocks which are produced in the crash at the stellar surface of the infalling material released from the inner edge of the disk through magnetic reconnections.

32432 (N—85-17820) HEAO-1 diffuse component spectrum from 15 to above 500 keV. Gruber, D.E.; Rothschild, R.E.; Matteson, J.L.; Kinzer, R.L. (California Univ., San Diego (USA)). Oct 1984. 3p. NTIS, PC A13/MF A01.

In Max-Planck Inst. fuer Physik und Astrophysik, x-ray and uv emission from active galactic nuclei, 129-134 p. (N—85-17790 08-88).

The spectrum of the diffuse X and gamma-ray background was measured over a band of 2 decades with scintillator detectors aboard the HEAO-1 satellite. The apertures of the detectors were modulated on time scales of hours and the difference in counting rates measured the diffuse component flux. The observed spectrum is presented and compared with other measurements. The possible contribution to the diffuse component above 100 keV from active galaxies is discussed. (ESA)

32433 (N—85-17926) SU(2) x U(1) vacuum and the Centauro events. Kazanas, D.; Balasubrahmanyan, V.K. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Apr 1984. 15p. (NASA-TM—86082). NTIS, PC A02/MF A01.

It is proposed that the fireballs invoked to explain the Centauro events are bubbles of a metastable superdense state of nuclear matter, created in high energy (E is approximately 10 to the 15th power eV) cosmic ray collisions at the top of the atmosphere. If these bubbles are created with a Lorentz factor gamma approximately = 10 at their CM frame, the objections against the origin of these events in cosmic ray interactions are overcome. Assuming further, that the Centauro events are to the explosive decay of these metastable bubbles, a relationship between their lifetime, tau, and the threshold energy for bubble formation, E sub th, is derived. The minimum lifetime consistent with such an interpretation in tau is approximately 10 to the -8th power sec, while the E sub th appears to be insensitive to the value of tau and always close to E sub th is approximately 10 to the 15th power eV. Finally it is speculated that if the available CM energy is thermalized in such collisions, these bubbles might be manifestations of excitations of the SU(2) x U(1) false vacuum. The absence of neutral pions in the Centauro events is then explained by the decay of these excitations.

32434 (N—85-18909) X-ray spectra of supernova remnants. Szymkowiak, A.E. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Feb 1985. 117p. (NASA-TM—86169; M—37). NTIS, PC A06/MF A01.

X-ray spectra were obtained from fields in three supernova remnants with the solid state spectrometer of the HEAO 2 satellite. These spectra, which contain lines from K-shell transitions of several abundant elements with atomic numbers between 10 and 22, were compared with various models, including some of spectra that would be produced by adiabatic phase remnants when the time-dependence of the ionization is considered.

32435 (N—85-18911) Instrumental background in balloon-borne gamma-ray spectrometers and techniques for its reduction. Gehrels, N. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Jan 1985. 88p. (NASA-TM—86162). NTIS, PC A05/MF A01.

Instrumental background in balloon-borne gamma-ray spectrometers is presented. The calculations are based on newly available interaction cross sections and new analytic techniques, and are the most detailed and accurate published to date. Results compare well with measurements made in the 20 keV to 10 MeV energy range by the Goddard Low Energy Gamma-ray Spectrometer (LEGS). The principal components of the continuum background in spectrometers with GE detectors and thick active shields are: (1) elastic neutron scattering of atmospheric neutrons on the Ge nuclei; (2) aperture flux of atmospheric and cosmic gamma rays; (3) beta decays of unstable nuclides produced by nuclear interactions of atmospheric protons and neutrons with Ge nuclei; and (4) shield leakage of atmospheric gamma rays. The improved understanding of these components leads to several recommended techniques for reducing the background.

32436 (N—85-18913) Progenitors of white dwarfs. Drilling, J.S.; Schoenberner, D. (Louisiana State Univ., Baton Rouge (USA)). 1985. 11p. (NASA-CR—174378). NTIS, PC A02/MF A01.

Direct observational evidence is presented which indicates that the immediate progenitors of white dwarfs are the central stars of planetary nebulae (approximately 70%), other post-AGB objects (approximately 30%), and post-HB objects not massive enough to climb the AGB (approximately 0.3%). The combined birth rate for these objects is in satisfactory agreement with the death rate of main-sequence stars and the birth rate of white dwarfs.

32437 (N—85-18935) Data analysis of electron measurements of the plasma experiment aboard the HELIOS probes. Pilipp, W.G.; Miggenrieder, H.; Muehlhaeuser, K.H. (Max-Planck-Institut fuer Physik und Astrophysik, Garching (Germany, F.R.)). Nov 1984. 48p. (MPE—185). NTIS, PC A03/MF A01.

Methods to derive distribution functions for solar wind electrons from the measurements of the plasma experiment aboard the HELIOS probes are outlined. Electrons are measured in the energy range from 0.5 to 1660 eV with one-dimensional angular resolution along the ecliptic plane. From these measurements electron distribution functions with high time resolution (18 sec) but poor angular resolution in velocity space (45 deg) and electron distribution functions with high angular resolution (5 to 10 deg) but poor time resolution (several minutes to few hours) are derived. (ESA)

32438 (N—85-18941) UCB cosmic ray experiment. Final report. (Bell Bros. Research Corp., Gardena, CA (USA)). 1984. 50p. NTIS, PC A03/MF A01.

The instrument package for measuring the abundance of heavy ions, primary cosmic rays ranging from hydrogen to iron, uses a lithium drifted silicon detector array to measure the ionization of minimizing ions. The direction of travel is defined by a drift chamber array. A simplified block diagram is presented as well as engineering drawings and specifications.

32439 (N—85-18942) Gamma-ray burster recurrence timescales. Schaefer, B.E.; Cline, T.L. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Sep 1984. 19p. (NASA-TM—86157). NTIS, PC A02/MF A01.

Three optical transients have been found which are associated with gamma-ray bursters (GRBs). The deduced recurrence timescale for these optical transients (tau sub opt) will depend on the minimum brightness for which a flash would be detected. A detailed analysis using all available data of tau sub opt as a function of E(gamma)/E(opt) is given. For flashes similar to those found in the Harvard archives, the best estimate of tau sub opt is 0.74 years, with a 99% confidence interval from 0.23 years to 4.7 years. It is currently unclear whether the optical transients from GRBs also give rise to gamma-ray events. One way to test this association is to measure the recurrence timescale of gamma-ray events tau sub gamma. A total of 210 gamma-ray error boxes were examined and it was found that the number of observed overlaps is not significantly different from the number expected from chance coincidence. This observation can be used to place limits on tau sub gamma for an assumed luminosity function. It was found that tau sub gamma is approx. 10 yr if bursts are monoenergetic. However, if GRBs have a power law luminosity function with a wide dynamic range, then the limit is tau sub gamma 0.5 yr. Hence, the gamma-ray data do not require tau sub gamma and tau sub opt to be different.

32440 (N—85-19900) **Far-infrared line observations of planetary nebulae. 1: the 0 III spectrum.** Dinerstein, H.L.; Lester, D.F.; Werner, M.W. (National Aeronautics and Space Administration, Moffett Field, CA (USA). Ames Research Center). Feb 1985. 46p. (NASA-TM—86670; REPT—85091). NTIS, PC A03/MF A01.

Observations of the far-infrared fine structure lines of O III have been obtained for six planetary nebulae. The infrared measurements are combined with optical O III line fluxes to probe physical conditions in the gas. From the observed line intensity ratios, a simultaneous solution was obtained for electron temperature and density, as well as means of evaluating the importance of inhomogeneities. Densities determined from the far-infrared O III lines agree well density diagnostics from other ions, indicating a fairly homogeneous density in the emitting gas. Temperatures are determined separately from the O III 4363/5007 A and 5007 A/52 micron intensity ratios and compared. Systematically higher values are derived from the former ratio, which is expected from a nebula which is not isothermal. Allowance for the presence of temperature variations within these nebulae raises their derived oxygen abundances, determinations to be reconciled with the solar value.

32441 (N—85-19901) **Boundary conditions for the paleoenvironment: chemical and physical processes in the presolar nebula.** Irvine, W.M.; Schloerb, F.P. (Massachusetts Univ., Amherst (USA)). Feb 1985. 10p. (NASA-CR—174370). NTIS, PC A02/MF A01.

Two additional hyperfine components of the interstellar radical C3H were detected. In addition, methanol was discovered in interstellar clouds. The abundance of HCCN and various chemical isomers in molecular clouds was investigated.

32442 (N—85-19904) **International Ultraviolet Explorer observations of amorphous hot galaxies.** Lamb, S.A.; Gallagher, J.S. III; Hjellming, M.S.; Hunter, D.A. (Illinois Univ., Urbana (USA)). Aug 1984. 46p. (NASA-CR—174354). NTIS, PC A03/MF A01.

In order to better understand the nature of star formation processes in amorphous galaxies, short wavelength International Ultraviolet Explorer (IUE) spectra of galaxies NGC 1705 and NGC 1800 were obtained. The IUE data for NGC 1705 were of excellent quality while the low signal-to-noise NGC 1800 observation was useful only as a rough guide to the ultraviolet energy distribution. It was found that NGC 1705 contains a normal mix of OB stars, which is consistent with the nearly constant recent star formation rate inferred from new optical data. The NGC 1800 is likely to have similar properties, and blue galaxies with amorphous structures thus do not show evidence for anomalies in stellar mass distributions. The UV spectra of amorphous galaxies and a variety of other hot extragalactic stellar systems have similar characteristics, which suggests OB stellar populations often are homogeneous in their properties.

32443 (N—85-19905) **Spectroscopic study of LMC X-4.** Petro, L.D.; Hiltner, W.A. (Massachusetts Inst. of Tech., Cambridge (USA)). 1982. 16p. (NASA-CR—174414). NTIS, PC A02/MF A01.

The orbital radial velocity semi-amplitude of the binary star system LMC X-4 primary was determined to be 37.9 + or - 2.4 km/s from measurements of the hydrogen absorption lines. The semi-amplitude of the He I and He II absorption lines are consistent with this, namely 44.9 + or - 5.0 and 37.3 + or - 5.3 km/s. The phase and shape of the radial velocity curves of the three ions are consistent with a circular orbit and an ephemeris based upon X-ray measurements of the neutron star, with the exception that the He II absorption line radial velocity curve has detectable shape distortion. Measurements of the He II LAMBOA 4686 emission line velocity are consistent with a phase shifted sine wave of semi-amplitude 535 km/s, a square wave of semi-amplitude 407 km/s, or high order harmonic fits. The spectral type was found to be 08.5 IV-V during X-ray eclipse. Variations to types as early as 07 occur, but not as a function or orbital phase. Absorption line peculiarities were noted on 6 of 58 spectra.

32444 (N—85-19912) **Solar Corona Explorer: a mission for the physical diagnosis of the solar corona.** (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Jul 1981. 82p. (NASA-TM—87416). NTIS, PC A05/MF A01.

Mission objectives and spacecraft requirements for the Solar Corona Explorer (SCE), a proposed free flying, unmanned solar research craft to be tenatively launched in 1987, were defined. The SCE's purpose is to investigate structure, dynamics and evolution of the corona, globally and in the required physical detail, to study the close coupling between the inner corona and the heliosphere. Investigative objectives are: (1) to understand the corona as the source of varying interplanetary plasma and of varying solar X-ray and extreme ultraviolet fluxes; (2) to develop the capabilities to model the corona with sufficient precision to forecast the Earth's variable environment in space, on the scales from weeks to years; (3) to develop an understanding of the physical processes that determine the dynamics and physical state of the coronal plasma, particularly acceleration processes; and (4) to develop insight and test theory on the Sun applicable to stellar coronae and winds, and in particular, to understand why cool stars put such a large fraction of their energy into X-rays. Considered related factors are: (1) duration of the mission; (2) onboard measuring instrumentation; (3) ground support equipment and procedures; and (4) programs of interpretation and modeling.

32445 (N—85-19913) **Directivity of Bremsstrahlung radiation from relativistic beams and the gamma-rays from solar flares.** Petrosian, V. (Stanford Univ., CA (USA)). Feb 1985. 30p. (NASA-CR—174433). NTIS, PC A03/MF A01.

It has been observed that flares with greater than 10 MeV gamma-ray emission are concentrated around the solar limb with a dispersion of 10 to 20 degrees. It is shown that the bremsstrahlung by relativistic electrons is responsible for such gamma-rays and that the expected relativistic beaming cannot explain this dispersion. It is argued that this dispersion is predominately a reflection of the pitch angle distribution of the electrons. Then it is shown that this requires a small variation of the magnetic field from the point where the electrons are injected to the photosphere and a nearly isotropic (in the downward direction) pitch angle distribution at the injection. The influence of other effects on the observed distribution is also discussed.

32446 (N—85-19916) **X-ray bursts: observation versus theory.** Lewin, W.H.G. (Massachusetts Inst. of Tech., Cambridge (USA)). 1981. 10p. (NASA-CR—174415). NTIS, PC A02/MF A01.

Results of various observations of common type I X-ray bursts are discussed with respect to the theory of thermonuclear flashes in the surface layers of accreting neutron stars. Topics covered include burst profiles; irregular burst intervals; rise and decay times and the role of hydrogen; the accuracy of source distances; accuracy in radii determination; radius increase early in the burst; the super Eddington limit; temperatures at burst maximum; and the role of the magnetic field.

32447 **(PUC-TN—08/83) Quantum and thermodynamic aspects of Black Holes.** Sande e Lemos, J.P. de; Videira, A.L.L. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). 1983. 33p. (In Portuguese). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701435.

The main results originating from the attempts of trying to incorporate quantum and thermodynamic properties and concepts to the gravitational system black hole, essentially the Hawking effect and the four laws of thermodynamics are reviewed.

32448 **(UCRL—92672) Some nuclear data needs in astrophysics.** Mathews, G.J.; Bauer, R.W.; Bloom, S.D.; Haight, R.C.; Howard, W.M.; Takahashi, K.; Ward, R.A. (Lawrence Livermore National Lab., CA (USA)). May 1985. Contract W-7405-ENG-48. 20p. (CONF-850507—20). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012916.

From International conference on nuclear data for basic and applied science; Santa Fe, NM, USA (13 May 1985).

In this paper we discuss a number of astrophysical environments and how improved nuclear data could facilitate a better understanding of them. One area of interest includes proton and alpha-particle reactions with unstable nuclei which are necessary for understanding the nucleosynthesis and energy generation in hot hydrogen-burning environments. Efforts underway at LLNL and elsewhere to develop the technology for the measurement of these reaction rates are discussed. Heavy-element nucleosynthesis in the late stages of red-giant stars and supernovae requires a complete network of neutron capture rates and beta-decay rates for nuclei near and far from stability. Experimental and theoretical efforts at LLNL to supply the input data and to model the nucleosynthetic environments will be outlined. Suggestions are made as to which nuclear data are most critical for the various scenarios. 42 refs., 11 figs., 1 tab.

32449 **(UCRL—92724) Stellar s-process diagnostics.** Mathews, G.J.; Ward, R.A.; Takahashi, K.; Howard, W.M. (Lawrence Livermore National Lab., CA (USA)). May 1985. Contract W-7405-ENG-48. 10p. (CONF-850375—5). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012926.

From 20. Rencontre de Moriond; Les Arcs, France (10 Mar 1985).

We argue that the solar-system σN curve can be best understood if the s-process is largely produced by stars in the mass range of $M \sim 2$ to 4 $M_{\odot}$. Several observations are then studied as indicators of the validity of this hypothesis. We find that isotopic Zr abundances and elemental (Ba/Sr) vs (Ba/Nd) ratios are consistent with these conditions. The elemental (Tc/Nb) ratio is found not to be an indicator of temperature as has been suggested but rather a measure of the age of an AGB star in the third dredge-up phase.

32450 **Can the universe be charged?.** Orito, S.; Yoshimura, M. (Department of Physics, University of Tokyo, Bunkyo-ku Tokyo 113, Japan). *Physical Review Letters;* **54**: No. 22, 2457-2460(3 Jun 1985).

We point out a possibility of temporal charge nonconservation in cosmological models based on more-dimensional theories a la Kaluza-Klein. A net excess charge may then have been created before the extra dimensional space was compactified. Cosmological implications of the excess charge are discussed.

32451 **Calculation of neutrino flux from Cygnus X-3.** Gaisser, T.K.; Stanev, T. (Bartol Research Foundation of the Franklin Institute, University of Delaware, Newark, Delaware 19716). *Physical Review Letters;* **54**: No. 20, 2265-2268(20 May 1985). Contract AC02-78ER05007.

We estimate the flux of neutrinos produced by protons accelerated by the compact partner in Cygnus X-3. Such neutrinos are produced in collisions with the atmosphere of the companion, and there can be substantial modulation due to absorption in the companion. The resulting flux of upward muons induced by neutrinos in rock below an underground detector is at the level of 1 per 1000 m^2 per year.

32452 **Evidence for muon production by particles from Cygnus X-3.** Marshak, M.L.; Bartelt, J.; Courant, H.; Heller, K.; Joyce, T.; Peterson, E.A.; Ruddick, K.; Shupe, M.; Ayres, D.S.; Dawson, J.; Fields, T.; May, E.N.; Price, L.E.; Sivaprasad, K. (School of Physics, University of Minnesota, Minneapolis, Minnesota 55455). *Physical Review Letters;* **54**: No. 19, 2079-2082(13 May 1985).

We have observed underground cosmic-ray muons, corresponding to a secondary flux of $\sim 7 \times 10^{-11}$ cm^{-2} s^{-1}, at a depth of 1800-m water equivalent, which appear to be initiated by Cygnus X-3. This identification is based on both direction and phase coherence. The existence of such secondary muons conflicts with the current understanding of photon cascades and/or the nature and location of Cygnus X-3.

32453 **QUIP: A time-dependent standard model.** Munier, A. (Los Alamos National Laboratory). *Astrophysical Journal;* **290**: No. 1, 47-65(1 Mar 1985).

A time-dependent solution representing the monotonic expansion o contraction of a self-gravitating gas sphere with polytropic index QUIP (quasi-invariant polytrope) is obtained from group theory. Radiation is introduced into the model through a dynamic diffusion description. Compatibility between the equations of hydrodynamics and radiation leads to the definition of a (time-dependent) standard QUIP generalizing Eddington's standard (static) model. The second-order dimensionless ordinary differential equation depending on a characteristic time scale a, used to describe the model, is solved numerically. Integral theorems by Ritter, Milne, Eddington, and Chandrasekhar, valid for a static configuration, are generalized to the case of the standard QUIP provided that two quantities are introduced: a Q-factor and a normalized moment of inertia. These two functions are calculated for different values of a. The solution of the standard QUIP is proved to depend on only three initial conditions related to experimental values. All quantities such as the ratio of the mean to the central density, the central density, pressure and temperature, etc., are calculated. A mass—radius—hydrodynamical time scale relation is given, together with a luminosity formula. Families of standard QUIPS can be characterized by a constant Q-factor and an effective temperature.

32454 **Noble gas component organization in Apollo 14 breccia 14318: ^{129}I and ^{244}Pu regolith chronology.** Swindle, T.D.; Caffee, M.W.; Hohenberg, C.M.; Hudson, G.B.; Laul, J.C.; Simon, S.B.; Papike, J.J. (McDonnell Center for the Space Sciences and Department of Physics, Washington University). *Journal of Geophysical Research;* **90**: No. S2, C517-C540(15 Feb 1985).

Noble gas, petrological, and chemical studies made on grain-size separates from lunar regolith breccia 14318 demonstrate that the noble gases are organized into two functional components, volume-correlated and surface-correlated. As in regolith breccia 14301, volume-correlated xenon in 14318 is primarily spallation-derived and the surface-correlated component contains not only solar wind xenon but also significant amounts of "parentless' xenon from the fission of now extinct ^{244}Pu and the decay of now extinct ^{129}I ("parentless" means the daughter products were incorporated onto grain surfaces following decay of the parent nuclide elsewhere). The ratio of $^{129}Xe/^{136}Xe$ in the total surface-correlated parentless component, as identified in grain-size analysis, is substantially higher than in the least tightly bound parentless component identified in stepwise heating analyses, confirming the trend seen in 14301. If the order of release of gases in stepwise heating is related to the order of incorporation in the simplest way (first in, last out), incorporation of these grain-surface components was probably time-ordered. The $^{129}Xe/^{136}Xe$ ratio in each identifiable parentless component would then be characteristic of the xenon available for surface adsorption at the particular time of acquisition. Continuous variations in this ratio further suggest that incorporation of the parentless xenon was closely coupled with production. Such observations provide the basis for a new chronometer from which we conclude that acquisition of parentless xenon was an ongoing process spanning at least 90 m.y., beginning no more than 44 +- 34 m.y. after the formation of the most meteorites and possibly predating xenon acquisition for the earth.

32455 **Electromagnetic ion beam instabilities: Hot beams at interplanetary shocks.** Gary, S.P. (Earth and Space Sciences Division, University of California, Los Alamos National Laboratory). *Astrophysical Journal;* **288**: No. 1, 342-352(1 Jan 1985).

This paper considers Vlasov instabilities driven by a very hot ion beam streaming parallel to a magnetic field. The linear theory of electromagnetic instabilities driven by such a beam in a homogeneous, collisionless, nonrelativistic plasma is used. Numerical solutions of the full linear dispersion equation for bi-Maxwellian distribution functions are presented. If the thermal speed of the beam is greater than its drift speed, the two dominant modes are the right-hand and left-had resonant ion beam instabilities. The parametric dependencies of the threshold drift speeds and growth rates for both modes are presented. In particular, the thresholds are shown to be sensitive functions of the beam temperature anisotropies. Arguments are presented that these two modes is sufficient to account for the amplitudes of MHD-like waves observed at such shocks.

32456 **Finite temperature corrections in N = 1 supergravity.** Olive, K.A. (Fermi National Accelerator Lab., Batavia, IL (USA). Astrophysics Theory Group); Srednicki, M.A. (California Univ., Santa Barbara (USA). Dept. of Physics). *Physics Letters, [Section] B;* **148**: No. 6, 437-439(6 Dec 1984).

We compute finite temperature corrections to the scalar potential for an arbitrary N=1 supergravity model. Applications to the inflation potential used for primordial inflation are discussed.

32457 **(AD-A—151414/0/XAB) Effects of finite-current-channel width on the current convective instability. Memorandum report, October 1983-October 1984.** Satyanarayana, P.; Chen, J. (Naval Research Lab., Washington, DC (USA)). 5 Mar 1985. 39p. (NRL-MR—5494). NTIS, PC A03/MF A01.

The effects of the finite-current channel width on the current-convective instability are studied both analytically and numerically. First, using a sharp-boundary field-aligned current distribution which has a finite width along the plasma-density gradient, the dispersion relation is obtained analytically. Numerically, results are also presented for a diffuse-boundary current velocity distribution. Applications to the high-latitude ionosphere are discussed.

32458 **(AD-A—151980/0/XAB) Effects of magnetic shear on lower hybrid waves in the suprauroral region. Final report, 1 April 1983-31 March 1984.** Bakshi, P. (Boston Coll., Chestnut Hill, MA (USA). Dept. of Physics). Jan 1985. 19p. NTIS, PC A02/MF A01.

Effects of magnetic shear on lower hybrid modes are investigated. It is shown that due to non-local effects, even a small shear can significantly affect the instability, leading to stabilization for some parameter ranges. These results are of importance in the context of the recently proposed mechanism of lower hybrid acceleration and ion evolution in the suprauroral region.

32459 **(N—85-17451) Plasma and magnetospheric research.** Comfort, R.H.; Horwitz, J.L. (Alabama Univ., Huntsville (USA)). Jan 1985. 13p. (NASA-CR—171293). NTIS, PC A02/MF A01.

Analysis techniques and software development, data analysis and modeling, spacecraft sheath effects, laboratory plasma flow studies, and instrument development are described.

32460 **(N—85-17461) Partial reflection D-region electron densities.** Manson, A.H.; Meek, C.E. (Saskatchewan Univ., Saskatoon (Canada)). Nov 1984. 11p. NTIS, PC A12/MF A01.

In International Council of Scientific Unions, middle atmosphere handbook, Vol. 13, 113-123 p. (N—85-17452 08-46).

The differential absorption technique of measuring electron densities as a function of height in the D region is discussed. In the basic experiment, pulses of medium or high frequency, usually at a fixed frequency (2 to MHz), are radiated upwards with known wave polarizatin (usually linear or circular) from a transmitter at ground level. Partial reflections, from ionospheric scatterers at heights below the E region, are received at the ground, and are resolved into two characteristic components, the ordinary (0) and extraordinary (E) modes whose amplitude ration A(x)/A(o) is then measured as a function of height, h. The heights of these are determined by delay times, the group retardation being minimal in the undisturbed D-region. The electronic system can be very simple. Power splitters and quadrature networks to separate the A(x) and A(o) components are commercially available at low prices and an A-D converter, height-gate system, and microcomputer allows the real-time calculation of mean amplitudes. The ratio of the coefficients of reflection of the two modes, as they originate at each reflection height is then calculable.

32461 **(N—85-17463) Incoherent scatter radar studies of the mesosphere.** Mathews, J.D. (Case Western Reserve Univ., Cleveland, OH (USA)). Nov 1984. 20p. NTIS, PC A12/MF A01.

In International Council of Scientific Unions, middle atmosphere handbook, Vol. 13, 135-154 p. (N—85-17452 08-46).

All current incoherent backscatter radars can make mesospheric or D region measurements under at least some conditions. The conditions under which measurements are possible are derived and shown for each radar. Conditions examined include overall system sensitivity, electron and ion spectral line widths and power distributions, and time/height averaging effects. The radar equations is derived and calibrations of the radar system is discussed. Total power only and combined total power and ion line spectral measurements are described in terms of ease of use, applicability to various radars, and parameters of aerodynamic interest derivable from the measurements.

32462 **(N—85-17468) D1 LF wind measurements in the 90 to 100 km height range.** Schminder, R.; Kurschner, D. (Leipzig Univ. (German Democratic Republic)). Nov 1984. 14p. NTIS, PC A12/MF A01.

In International Council of Scientific Unions, middle atmosphere program, Vol. 13, 241-261 p. (N—85-17452 08-46).

A short historical review of the development and use of D1 low frequency (LF) techniques for wind measurement is presented and the measuring and evaluation procedures are described. The advantages and disadvantages of D1 LF measurements are examined. Finally, the results of measurements over Central Europe acquired by the Collm Geophysical Observatory are discussed.

32463 **(N—85-17925) Current carriers for the field-aligned current system.** Hoffman, R.A.; Sugiura, M.; Maynard, N.C. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Sep 1984. 21p. (NASA-TM—86161; CONF-8406167—7). NTIS, PC A02/MF A01.

From 25. plenary session of COSPAR; Graz, Austria (25 Jun 1984).

The Dynamics Explorer satellites have returned a large body of data containing high resolution magnetometer measurements and distributions of charged particles of all but thermal electrons. From these data the relations of the field aligned currents to particle precipitation structures were investigated and the charge carriers were identified. Results include the following: (1) during very quiet periods, field aligned currents exist primarily as fine structure; (2) during onset of substorms, region 1 and region 2 become clearly evident but contain significant structure; (3) as magnetic activity subsides, current regions become less distinct, and structure becomes more dominant; (4) the distribution of the upward currents derived from magnetometer data and calculated from suprathermal electron data agree remarkably well in shape but not necessarily in magnitude; (5) at all local times; 5 eV electrons seldom carry most of the upward current; (6) except for the accelerated inverted-V electrons, the dominant upward current carriers which are measured are below 500 eV and are distributed in energy (7) dusk upward currents (region 1) are associated with the boundary plasma sheet and (8) suprathermal electron bursts are important current carrying structures.

32464 **(N—85-19823) Research study of space plasma boundary processes. Final report, 1 October 1983-30 September 1984.** Greenstadt, E.W.; Taylor, W.W.L. (TRW Space Technology Labs., Redondo Beach, CA (USA)). Oct 1984. 45p. (NASA-CR—174351). NTIS, PC A03/MF A01.

Representation of the Earth's bow shock and magnetopause and their geometrically determined macrostructure was investigated. Computer graphic depictions of the global distributions of bow shock structures and elementary animation of the dynamics of those distributions in the changing solar wind were developed. The shock-foreshock boundary and subcritical bow shocks as observed by ISEE 1 and 2 are discussed.

32465 **(SD-TR—84-50) Earth's radiation belts.** Schulz, M. (Aerospace Corp., El Segundo, CA (USA). Space Sciences Lab.). 28 Sep 1984. 45p. NTIS, PC A03/MF A01. File Number DE85901411.

This report reviews the status of radiation-belt science at the close of the data-acquisition phase (1976-1979) of the International Magnetospheric Study (IMS). The purpose is to place recent discoveries in context with respect to long-standing problems, and to indicate possible directions for future research in radiation-belt physics. The review includes a synopsis of results achieved on topics related to the source, energization, transport, and loss processes that affect geomagnetically trapped radiation, as well as results concerning certain subtle consequences of adiabatic charged-particle motion. Major areas of interest include the effects of charge exchange and radial transport on the ion composition of the ring current and radiation belts, the measurement of ion distributions in all three dimensions of velocity space, and the evolution of radiation-belt particle intensities as a consequence of temporal variations of transport coefficients and boundary conditions over the solar cycle and over the course of a magnetic storm. Moreover, the realization is developing that the major uncertainties in radiation-belt physics lie beyond the radiation belts themselves. These uncertainties include: (1) the problem of particle energization in the plasma sheet, which defines an outer boundary condition for the ring current and radiation belts; (2) the problem of particle energization in solar flares and in Jupiter's magnetosphere, both of which seem to constitute sources for the earth's radiation belts; and (3) the relationship of large-scale electric- and magnetic-field fluctuations across the magnetosphere to interplanetary parameters and geomagnetic indices that vary with time.

32466 **Poleward leap of the auroral electrojet as seen in auroral images.** Hones E.W. Jr. (University of California, Los Alamos National Laboratory, New Mexico). *Journal of Geophysical Research;* **90**: No. A6, 5333-5337(1 Jun 1985).

This paper discusses a recently published series of 12 successive images of the northern auroral oval obtained by the University of Iowa's auroral imager on DE 1 during a substorm on November 8, 1981. The images showed a sudden (within <12 min) thickening and poleward expansion of the midnight sector of the oval that occurred at the "maximum epoch" of the substorm, i.e., as auroral zone bays reached their peaks and began to subside about 90 min after the expansive phase onset. We propose that this was the auroral manifestation of the poleward leap of the auroral electrojet that has been reported on many occasions to coincide with thickening of the plasma sheet in the outer magnetotail (beyond ~15 R/sub E/) late in a substorm. The plasma sheet thickening is thought to be associated with a tailward retreat of the substorm magnetic neutral line. We note evidence that the neutral line's tailward retreat influences auroral currents and particle precipitation even at low auroral latitudes. Modifications of the present auroral substorm model are suggested.

32467 **Simulation study of type 2 counterstreaming electrons along auroral field lines.** Wagner, J.S.; Lin, C.S.; Tajima, T. (Sandia National Laboratory, Albuquerque, New Mexico). *Journal of Geophysical Research;* **90**: No. A5, 4249-4260(1 May 1985).

We examine the production of counterstreaming electrons associated with parallel fields along auroral field lines through the use of computer simulation. We use a 2 1/2 -dimensional (two spatial and three velocity dimensions) electrostatic particle algorithm and auroral boundary conditions to set up a self-consistent V potential structure. The simulation produces signatures of counterstreaming electrons resembling those observed by the Dynamics Explorer 1 (DE 1) satellite. The main signatures are as follows: (1) the phase space contours of the electron distribution function are elongated along the V/sub parallel/ axis, and (2) the energy of electrons streaming in the upward direction is comparable to the energy of the accelerated electron beam. The simulation indicates that a portion of the accelerated electron beam is trapped by large amplitude electrostatic waves produced through the two-stream instability. Strong wave-particle interactions then thermalize the trapped electrons to produce suprathermal electrons streaming in the direction opposite to that of the accelerated electron beam. These results suggest a possible mechanism of producing a counterstreaming electron fluxes through nonlinear processes of the two-stream instability.

32468 **Simulations of high—Mach-number collisionless perpendicular shocks in astrophysical plasmas.** Quest, K.B. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review Letters;* **54**: No. 16, 1872-1874(22 Apr 1985).

A problem of critical importance to space physics and astrophysics is the existence and properties of high—Mach-number shocks. In this Letter we present the preliminary results of a simulation of a perpendicular shock with Alfven Mach number 22. We show that for sufficiently small electron resistivity the dissipation for this shock is provided by a periodic, rather than time-stationary, reflection of ions. We discuss the problem of electron heating and the extension to higher Mach numbers.

32469 **Computer modeling of magnetotail convection.** Birn, J.; Schindler, K. (University of California, Los Alamos National Laboratory, Los Alamos, New Mexico). *Journal of Geophysical Research;* **90**: No. A4, 3441-3447(1 Apr 1985).

We studied the dynamic evolution of the geomagnetic tail in response to a dawn-to-dusk electric field E/sub y/ applied at the high-latitude boundary by means of a two-dimensional nonlinear MHD code. We found that the electric field propagates inward through the lobes toward the plasma sheet. Only a small fraction, however, penetrates into the interior of the plasma sheet, and eventually an almost linear decrease from the boundary to the equatorial plane is assumed. There was no tendency to evolve toward a steady or nearly steady state which would require E/sub y/ roughly-equal const in a larger area. The resulting time-dependent changes are consistent with quasi-static analytic models of Schindler and Birn (1982) and Birn and Schindler (1983) and with observed substorm growth phase effects in the near tail. If the external electric field E/sub y/ is constant or varies only slightly along the tail, the convection speed within the plasma sheet remains small. A strongly nonuniform external electric field E/sub y/ leads to similar spatial and temporal variation of E/sub y/. It does, however, produce a locally much stronger thinning which favors the onset of a tail instability such as the tearing mode. It can also produce stronger flows primarily parallel to the magnetic field.

32470 **Coupling of Newborn ions to the solar wind by electromagnetic instabilities and their interaction with the bow shock.** Winske, D.; Wu, C.S.; Li, Y.Y.; Mou, Z.Z.; Guo, S.Y. (Los Alamos National Laboratory, New Mexico). *Journal of Geophysical Research;* **90**: No. A3, 2713-2726(1 Mar 1985).

The process by which the solar wind assimilates newly ionized atoms is important for understanding the presence of planetary or interstellar helium in the solar wind, the dynamics of the Active Magnetospheric Particle Tracer Explorers (AMPTE) lithium releases in front of the earth's bow shock, and the formation of cometary tails. In this paper we examine how newborn ions can be coupled to the solar wind in the direction parallel to the magnetic field by means of electromagnetic instabilities driven by the distribution of newborn ions. The linear properties of three instabilities are analyzed and compared with numerical solutions of the linear dispersion equation, while their nonlinear behavior is followed by means of computer simulation to obtain the characteristic time for the pickup process. With a primary emphasis on the AMPTE lithium releases, various degrees of realism are introduced into the calculations to model the upstream conditions and the intersection of the lithium with the bow shock. It is shown that a time-dependent shock model is needed to correctly reproduce the amount of lithium which is transmitted through the shock and that the resulting lithium ion distribution is still likely to be subject to the same type of instabilities in the magnetosheath. Application of these results to comets, in particular the artificial comet expected to be generated by the AMPTE barium release in the magnetosheath, is also briefly discussed.

32471 **Slow-mode shocks: A semipermanent feature of the distant geomagnetic tail.** Feldman, W.C.; Baker, D.N.; Bame, S.J.; Birn, J.; Gosling, J.T.; Hones E.W. Jr.; Schwartz, S.J. (Los Alamos National Laboratory, University of California, Los Alamos, New Mexico). *Journal of Geophysical Research;* **90**: No. A1, 233-240(1 Jan 1985).

A survey is made of the relative frequency of encounters with slow-mode shocks observed by ISEE 3 in the distant geomagnetic tail. The association of these shocks with the phase of substorm activity as evidenced by enhanced currents in the auroral ionosphere and enhanced energetic-particle populations at geostationary orbit is also documented. During the 25 days between January 18 and February 11, 1983, 26 unambiguous examples of slow shocks were observed. Although a very strong association with the level of geomagnetic activity is found, shocks were observed during all phases of substorm activity including one during quiet conditions. Slow-mode shocks must therefore be a semipermanent feature of the bounding surfaces which separate lobe and plasma sheet particle populations in the distant geomagnetic tail.

32472 **Gyrating ions and large-amplitude monochromatic MHD waves upstream of the earth's bow shock.** Thomsen, M.F.; Gosling, J.T.; Bame, S.J.; Russell, C.T. (Los Alamos National Laboratory, New Mexico). *Journal of Geophysical Research;* **90**: No. A1, 267-274(1 Jan 1985).

Episodes of nearly monochromatic, low-frequency ($\sim$0.03 hz) hydromagnetic waves are occasionally observed upstream of the earth's bow shock. These waves have previously been associated with suprathermal ions of the "intermediate" type of distribution and have been attributed to the early stage of disruption of a field-aligned ion beam through the electromagnetic ion beam instability. However, high time resolution (3 s) measurements of two-dimensional ion distributions during two nearly monochromatic wave events reveal that the ion distributions associated with these waves are, in fact, "gyrating ions." Such distributions consist of suprathermal ions with parallel and perpendicular velocities confined to a fairly narrow range of (nonzero) values. The ions are also often confined to a fairly narrow range of gyrophase angle ("gyrophase bunched"). In one of the two cases, the observed frequency of the waves agrees quite well with the Doppler shifted resonance frequency of waves in right-hand resonance with the observed gyrating ions. In the second case, the observed frequency is lower than the predicted frequency by a factor of $\sim$1.5—2.

32473 **Solar wind variations and geomagnetic storms: A study of individual storms based on a high time resolution ISEE-3 data.** Akasofu, S.h.; Olmsted, C.; Smith, E.J.; Tsurutani, B.; Okida, R.; Baker, D.N. (Geophysical Institute, University of Alaska, Fairbanks). *Journal of Geophysical Research;* **90**: No. A1, 325-340(1 Jan 1985).

We employ two independent methods to determine the relationship between the ϵ parameter and the total energy dissipation rate of the magnetosphere by selecting disturbed periods from the same data set used by Baker et al. (1983). Specifically, four storms are examined in detail, since the accuracy of estimating U/sub T/ is significantly improved during disturbed periods. The first method assumes U/sub T/ = M/sub A//sup 2alpha/ϵ, where M/sub A/ is the Alfven Mach number and α varies with time. The second method considers a linear, time-invariant dynamic system with ϵ as input and U/sub T/ as output. This means U/sub T/ = W*ϵ, where * is convolution and W is a transfer function characteristic of the system. It is found that α values fluctuate mainly between 0 and -0.25. The transfer function analysis indicates that W often resembles a δ-function or a narrow rectangular impulse. Both results give the same implication (namely, U/sub T/ $\sim\epsilon$) and thus are consistent with the view that the magnetosphere is primarily a directly driven system during disturbed periods.

32474 **(AD-A—151301/9/XAB) High current beam hollowing instability study. Final technical report.** Ekdahl, C.A. (Mission Research Corp., Albuquerque, NM (USA)). Jan 1985. 47p. NTIS, PC A03/MF A01.

High-current relativistic electron beams propagating in air are subject to a variety of macroscopic resistive instabilities, including hollowing, hose, and filamentation. Although the hose instability typically dominates experiments, computer simulations indicate that hollowing is potentially very disruptive to fast-current-risetime beams, especially at low air density. There have been at least three experiments that exhibited the hollowing instability clearly. Results from the last of these, performed using the 4-MeV, 70-kA IBEX beam generator, are analysed. The instability occurs routinely in computer simulations for beam currents above 17 kA and risetimes less than a few ns in full-density air, and over broader parameter ranges at reduced air densities. It develops rapidly in the beam nose and is highly disruptive. Although emittance tailoring and electron energy spread can raise the threshold for the onset of hollowing, the stability of high-current beams against hollowing can be assured only by maintaining a sufficiently long current risetime. A series of three high-current beam experiments have been performed to confirm this theoretical picture of the hollowing instability.

32475 **(AD-A—151763/0/XAB) Theory of electron-impact atomic ionization cross sections. Annual summary report, 1 July 1984-30 June 1985.** Girardeau, M.D. (Oregon Univ., Eugene (USA)). Mar 1985. 8p. NTIS, PC A02/MF A01.

The research underway is concerned with both the general theory and detailed calculations of differential cross sections for charge exchange and electron impact ionization occurring in collisions of simple atomic, ionic, and molecular species.

32476 **(AD-A—151958/6/XAB) Population inversion in laser-initiated vacuum arcs. Annual report, 1 February 1984-31 January 1985.** Krishnan, M. (Yale Univ., New Haven, CT (USA)). 25 Jan 1985. 54p. NTIS, PC A04/MF A01.

A detailed study of resonant photo-excitation of CII ions in a vacuum arc discharge by line radiation from laser-produced, AlIII ions was completed. Although enhanced fluorescence by up to a factor of eight in CII at 2138 A was observed, the collisional-radiative kinetics are such as to prevent a population inversion from building up under the conditions of the experiments. This unfavorable conclusion prompted the identification of a new class of Be-like, photo-excited lasers with potential laser wave-lengths from 2177 A in CIII down to 230 A in MgIX. Design considerations for such lasers are presented. Initial experiments in CIII pumped by MnVI line radiation have shown fluorescence enhancements in CIII at 2177 A by up to a factor of 150. Optimization of the pump plasma geometry has increased this enhancement to a factor of 500. Gain estimates are given which suggest that a laser can be constructed at 2177 A.

32477 **(AD-A—152001/4/XAB) Studies of collisional and nonlinear radiative process for development of coherent uv and xuv sources. Final report, November 1983-November 1984.** Rhodes, C.K.; Pummer, H.; Egger, H. (Illinois Univ., Chicago (USA). Dept. of Physics). Nov 1984. 116p. NTIS, PC A06/MF A01.

The availability of recently developed high-brightness picosecond rare-gas halogen sources permits the performance of a broad range of basic physical studies of high-lying electronic states of atomic and molecular materials. Moreover, the extension of the ultraviolet source technology to the femtosecond range will enable the generation of extreme physical environments, namely, coherent irradiation with an electric field amplitude, that are impossible to establish by any other known means. Experiments conducted over the past year indicate that it may be feasible to examine the detailed properties of states in a wide variety of systems in the region above 100 eV, and even possibly into the 1000 range of excitation, with these new experimental tools. The excited configurations of principal interest are those coupled to adjacent continua, prominent members of which are multiply excited and core excited states. The nature of intra-atomic interactions, including collective motions, figures naturally and importantly in this topic.

(Brookhaven National Lab., Upton, NY (USA)). 1985. Contract AC02-76CH00016. 3p. (CONF-850504—122). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012515.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

An atomic hydrogen source, designed to operate in the viscous flow range, has been built at BNL. A unique feature of this source is a miniature gap between a teflon tube which guides the beam and an accommodator which cools it. Across this gap a step-function in temperature, with the teflon temperature exceeding 100°K and the accommodator temperature below 8°K, was successfully maintained. This configuration collimates the beam enough to prevent significant diffusive losses without subjecting it to the temperature range of high recombination. Initial results with an orifice of only one-tenth the dissociator aperture are indicative of particle density in the beam of well above 10^{10} cm^{-3}. 4 refs., 1 fig.

From International Europhysics conference on high energy physics; Brighton, UK (20 Jul 1983).

Light neutral particles such as axions could be emitted in orthopositronium annihilation: $e^+e^-(^3S_1) \rightarrow a^0\gamma$. Status and perspectives of an experiment to observe such decays are discussed.

32480 **(CONF-850560—4) Exit channels of autoionization resonances in atoms.** Krause, M.O. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012299.

From Workshop on autoionization of atoms and small molecules; Argonne, IL, USA (2 May 1985).

In many-electron atoms with open shells strong autoionization resonances occur when an electron from an inner, weakly bound subshell is excited. Usually, the resonance state lies above several ionization thresholds and, hence, will decay into more than one exit or continuum channel. Several cases are discussed in which the resonance state is induced by synchrotron radiation, and the exit channels are differentiated and characterized by the analysis of the ejected electrons.

32481 **(CONF-8504136—1) Experimental x-ray scattering cross sections for H_2 and rare atomic gases.** Ice, G.E. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 23p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011572.

From New directions in X-ray scattering workshop; Asilomar, CA, USA (3 Apr 1985).

Slides are presented for a talk on x-ray scattering from rare gases as an unambiguous test of ab initio wave functions and theoretical x-ray scattering cross sections.

32482 **(CTA-IEAV-RP—02/84) High-resolution spectroscopy of the N_2O in the far infrared using a tunable diode laser.** Torres Filho, A. (Centro Tecnico Aeroespacial, Sao Jose dos Campos (Brazil). Inst. de Estudos Avancados). Mar 1984. 317p. (In Portuguese). NTIS (US Sales Only), PC A14/MF A01. File Number DE85701410.

The high resolution spectroscopy of the N_2O molecule in the 17,5 to 15,8 μm (570 to 630 cm^{-1}) region was analysed using a tunable diode laser spectrometer (Spectro-Physics, model SP-5000). The main goal for this study is the use of the various well-known N_2O absorption lines as calibration standard for the precise determination of absorption line positions of other molecules, in the same spectral region.

32483 **(DESY—85-002) Comment on 'Path integral solution for a Mie-type potential'.** Steiner, F. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Jan 1985. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751633.

We comment on several incorrect results given in a recent paper by Erkoc and Sever (ES). In particular, it is pointed out that their path integral formula for the one-dimensional Mie-Lennard-Jones potential is wrong, since a quantum correction proportional to $(h/2\pi)^2$ - which is a consequence of the stochastic nature of the Feynman paths - has been overlooked. The correct expression can be obtained from a general path integral formula, which we have derived in a previous paper. For the particular potential discussed in detail by ES, we give a complete path integral treatment, which allows us to derive the energies and normalized wave functions of the discrete spectrum.

32484 **(DOE/ER/13137—T1) Generation of stimulated emission in the soft x-ray range by nonlinear processes with excimer lasers. Progress report, October 1, 1984-May 15, 1985.** Rhodes, C.K.; Boyer, K.; Luk, T.S.; Johann, U.; Schwarzenbach, A.P. (Illinois Univ., Chicago (USA). Dept. of Physics). 1985. Contract AC02-83ER13137. 36p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012465.

Studies of multiphoton ionization of atoms have revealed several unexpected characteristics. The confluence of the experimental evidence leads to the hypothesis that the basic character of the atomic response involves highly organized coherent motions of entire atomic shells. The important regime, for which the radiative field strength E is greater than an atomic unit ($e/a_0{}^2$), can be viewed in approximate correspondence with the physics of fast (~10 MeV/amu) atom-atom scattering. This physical picture provides a basis for the expectation that stimulated emission in the x-ray range can be produced by direct highly nonlinear coupling of ultraviolet radiation to atoms. 53 refs., 8 figs.

32485 **(DOE/ER/45130—T1) Non-empirical interatomic potentials for transition metals. [Progress report].** (Washington Univ., St. Louis, MO (USA)). 07 Jun 1985. Contract FG02-84ER45130. 7p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013448.

Research is reported in the study of metallic bonding and interatomic potential functions. Topics covered include many-atom interactions and the notion of an effective pair potential in a metal, interactions between transition metal ions in semiconductors and insulators, mathematical techniques for extrapolation from incomplete information about atomic distribution functions, and bonding and electronic structure of filled d-band tetrahedral compounds. (GHT)

32486 **(FIAS-R—131) Interpretation of intensities in electron-momentum and photoelectron spectroscopies.** McCarthy, I.E. (Flinders Univ. of South Australia, Bedford Park. Inst. for Atomic Studies). Jun 1984. 40p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85700986.

Relative intensities for the photoelectron reaction on atoms and molecules are not related to structure calculations in the same way as those for the noncoplanar symmetric (e,2e) reaction. The photoelectron dipole matrix element is dependent on recoil momentum only through its unique relationship to the photon energy and is much harder to calculate for chemically-interesting momenta. Relative intensities for binary (e,2e) reactions are independent of total energy at high enough energies and strongly dependent on symmetry and recoil momentum, for which an intensity profile can be measured for values starting at zero. In comparing with structure calculations, binary (e,2e) intensities for low recoil momentum may be compared directly with pole strengths in calculations of the one-electron Green's function or corresponding configuration-interaction calculations. In the case of states within a single symmetry manifold the relative intensities will be independent of recoil momentum up to some maximum, usually at least a few atomic units.

32487 (FRNC-TH—1918) **Study and characterization of a phosphorous ion source and development of a emittance-meter suited to multi-beam ion sources.** Hoang Gia Tuong. (Nancy-1 Univ., 54 (France)). Dec 1982. 97p. (In French). NTIS (US Sales Only), PC A05/MF A01. File Number DE85751343.

The ionization process which is used is the electronic bombardment. Phosphorus choice for the source experimentation is motivated by its principal destination: ionic implantation. Heavy ion applications are also quoted. Operating conditions allowing good results to be obtained are determined after a study of different parameters such as the electron current, the neutron pressure and the extraction voltage: the ion current obtained is of the order of mA. The source emittance, representing the quality of the ionic beam, is measured by a method suited to multibeam sources.

32488 (GSI—84-60-Prepr.) **Positron emission from the supercritical vacuum.** Kienle, P. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Oct 1984. 25p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751122.

During the last years systematic experiments to study the pair creation in heavy ion-atom collisions were carried out using ^{208}Pb, ^{232}Th and especially ^{238}U beams from UNILAC heavy ion facility of the GSI in Darmstadt. While most experiments focused on bombarding energies around the Coulomb barrier some exploratory studies of positron production in deep inelastic reactions were reported. In this contribution our attention will be directed on reactions at the Coulomb barrier, in which unexpectedly positron lines at around 300 keV kinetic energy with a line width of about 60 keV were observed. The study of the characteristic features of these lines will be reported especially also in context with the suggestion that they originate from spontaneous positron decay of the overcritical vacuum of rather longlived (proportional 10^{-20}s) giant nuclei with $182<=Z<=188$.

32489 (GSI—84-64-Prepr.) **Bound electrons in critical magnetic fields.** Schlueter, P.; Soff, G.; Wietschorke, K.H.; Greiner, W. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Oct 1984. 32p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85780952.

We determined the threshold for spontaneous electron-positron pair creation for various combinations of a nuclear Coulomb field and an external homogeneous magnetic field. The dependence of electron binding energies of the nuclear charge and the magnetic field strength is investigated. Our exact solutions of the Dirac equation are compared with approximative methods valid for weak and rather strong magnetic fields.

32490 (GSI—84-65-Prepr.) **Calculations of deeply bound pionic states in heavy and superheavy atoms.** Friedman, E.; Soff, G. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Oct 1984. 14p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85780953.

Binding energies and widths of pions bound in the 1s-state of heavy and superheavy atoms are evaluated. The repulsive strong interaction lowers the Coulomb binding energy by up to 50%. The energy width of the strongest bound state investigated becomes comparable with the binding energy. No drastic consequence on the pion propagation in nuclear matter is expected.

32491 (INIS-mf—9632, pp 9) **Anomalous strong interaction in pionic atoms of Mg and Al.** Achard van Enschut, J.F.M. d' (Technische Hogeschool Delft (Netherlands)); Berkhout, J.B.R. (Vrije Univ., Amsterdam (Netherlands)); Duinker, W. (Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie K). 19 Oct 1984. 32493 (JAERI-M—84-005) **X-ray photoelectron and x-ray-induced Auger electron spectroscopic data, 1. 3d transition-metals (Sc, Ti, V, Ni) and related oxides.** Baba, Yuji; Sasaki, T.A. (Japan Atomic Energy Research Inst., Tokyo). Feb 1984. 43p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85700988.

The intrinsic data of the X-ray photoelectron spectra (XPS) and X-ray-induced Auger electron spectra (XAES) for 3d transition-metals and related oxides were presented. The clean surfaces of the metals were obtained by two different methods ; mechanical filings and Ar^+ ion etchings. The oxides examined are typical compounds such as Sc_2O_3, TiO_2, V_2O_5 and NiO. The report consists of 4 wide scans, 26 core-line spectra, 10 valence-band spectra and 20 XAES spectra. The peak positions of the core-lines and the Auger lines were summarized in 8 tables together with their chemical shifts.

32494 (JINR—R-2-83-899) **Hidden symmetry, separation of variables and interbasis expansions in the two-dimensional hydrogen atom.** Mardoyan, L.G.; Pogosyan, G.S.; Sisakyan, A.N.; Ter-Antonyan, V.M. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1983. 18p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85700985.

Submitted to the journal J. Phys., A.

A group of hidden 0/3/ symmetry of the discrete spectrum of the two-dimensional hydrogen atom is determined on the basis of the method of separation of variables. Expansions for each fundamental basis of this group over two others are found and an additional integral of motion corresponding to an elliptic basis is determined. Representations of the elliptic basis as a superposition of polar and parabolic states are obtained. Certain interesting limiting cases are investigated.

32496 (LA-UR—85-1606) **Beam potential measurement of an intense H^- beam by use of the emissive probe technique.** Sherman, J.D.; Allison, P.; Smith, H.V. Jr. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—65). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012671.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

An emissive probe has been developed to study the beam-plasma potential generated by a 20-keV, 30-mA/cm^2 quiescent H^- beam propagating in Xe background gas. An axial ion trap has been built, and its influence on the measured potentials is reported. The peak plasma potential at 10^{13} cm^{-3} Xe density increased from +5V to +10V when the ion-trap voltage was increased from zero to +80V. The quiescent H^- beam rms emittance, measured 34 cm from the ion source, increased from 0.012 to 0.023 π x cm x mrad when the Xe density was decreased from 2.2 x 10^{12} cm^{-3} to zero. 8 refs., 3 figs.

File Number DE85780939.

In Annual report June 1984. [Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Center].

The study deals with krypton L-shell excitation in Kr-Kr and Kr-Xe collisions. Krypton L-shell vacancy production in slow Kr-Kr and Kr-Xe collisions has been investigated both experimentally and theoretically. Impact parameter dependent vacancy production rates have been obtained for Kr-Kr collision energies of 0,7 1,05 1,4 MeV and for Kr-Xe collision energies of 0,7 1,05 and 1,4 MeV. The differential cross sections for Kr-L excitation in Ar-Kr collisions and the total cross sections for Kr L-shell vacancy production were determined.

32501 (NRCN—544) **Calculation of collisional angular-momentum mixing of Rydberg states.** Oreg, J.; Strauss, M.; Hazak, G. (Israel Atomic Energy Commission, Beersheba. Nuclear Research Center-Negev). Sep 1983. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701411.

Exact solutions of the coupled differential equations for collisional mixing probabilities are presented for a sodium-helium system. The results show that complete mixing is not reached in this model. The main contribution to the collisional mixing cross-section of the sodium "nd" state comes from impact parameters b within the range $n^2<=b<=2n^2$. The total cross-sections obtained are in agreement with the experiment.

32502 (ORNL/TM—9501) **Electron impact ionization of multicharged ions at ORNL: 1980-1984.** Gregory, D.C.; Crandall, D.H.; Phaneuf, R.A.; Howald, A.M.; Dunn, G.H.; Falk, R.A.; Meuller, D.W.; Morgan, T.J. (Oak Ridge National Lab., TN (USA)). May 1985. Contract AC05-84OR21400. 97p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85013104.

Experimental electron-impact ionization cross sections for thirty-seven target ions are presented, summarizing measurements made at ORNL during the period from 1980 through early 1984. Target ions range in atomic number from Z = 5 (boron) to Z = 73 (tantalum), with charge states ranging from +2 through +6 and energies ranging from below the ionization threshold to 1500 eV in most cases. All data are presented in both tables and graphs. Maxwellian ionization rate coefficients are tabulated over the equivalent temperature range 10 to 3000 eV, and fitting parameters are given to allow the calculation of rates at intermediate electron temperatures or for inclusion in computer programs for plasma modeling.

32503 (PUC-TN—09/83) **Electrons in crossed laser and magnetic fields: an exactly soluble model in QED.** Davidovich, L.; Rochlin, H. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Jun 1983. 9p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701412.

The interaction of an electron with a static and uniform magnetic field B sup(→), in the presence of the quantized electromagnetic field, is studied by means of an exactly soluble model, which allows the study of the line shape of the scattered radiation in the resonance region, with spontaneous emission effects taken into account. The model also allows an exact renormalization procedure, after which the calculated spectrum remains finite, in the point-electron limit. In particular it is found, in this limit finite expressions for the linewidth and the energy shift of the scattered radiation, as functions of B. Explicit expressions for the electron and field operators are also found, and the correspondence of these results with classical solutions is discussed.

32504 (PUC-TN—10/83) **High-intensity ionization approximations: test of convergence in a one-dimensional model.** Antunes Neto, H.S.; Davidovich, L.; Marchesin, D. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Jun 1983. 9p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701413.

By solving numerically a one-dimensional model, the range of validity of some non-perturbative treatments proposed for the problem of atomic ionization by strong laser fields is examined. Some scaling properties of the ionization probability are established and a new approximation, which converges to the exact results in the limit of very strong fields is proposed.

32505 (PUC-TN—17/83) **Direct Coulomb ionization of the 1s σ molecular orbital by slow heavy projectiles following hyperbolic paths.** Montenegro, E.C.; Sigaud, G.M. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Jun 1983. 9p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701414.

Briggs united-atom model is used to derive the direct Coulomb ionisation cross-section of the 1s σ molecular orbital by slow projectiles following hyperbolic paths.

32506 (PUC-TN—28/83) **Nonperturbative treatment of decaying states.** Nussenzveig, H.M. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Oct 1983. 33p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701415.

An exactly soluble model of a multilevel atom interacting with the quantized radiation field is treated. The general solution for the resolvent matrix elements in the sector of interest is obtained. The solution is explicitly evaluated when the interaction matrix elements are the exact ones associated with a nonrelativistic hydrogen atom, including retardation. The analytic properties of the resolvent are discussed. The results are applied to derive the time evolution of a Weisskopf-Wigner initial state and the resonance scattering of an incident photon wave packet by the atom, including radiative level shifts.

32507 (SAND—84-2065C) **Electron and photon stimulated desorption from organic molecular solids: final state leading to desorption.** Kelber, J.A. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 7p. (CONF-8410274—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85004651.

From Diet II conference; Elmau, F.R. Germany (14 Oct 1984).

The results discussed here for both fluoroalkanes and neopentane illustrate how useful a systematic variation of chemical structure can be in investigating desorption mechanisms. Condensed thin films of large organic molecules are obviously ideal for this purpose. Additional benefits include the ability to avoid charging by using a sufficiently thin film on a metal substrate and the relative ease of preparing a fresh surface after damage by electron or photon bombardment. One must, however, exercise some caution in extending results from experiments performed on such materials to real world extended systems such as polymers and semiconductor surfaces. The effect of system size on desorption mechanisms is not well understood, and much work in this area can be anticipated in the near future. 23 refs., 4 figs.

32508 (UCRL—15671) Atomic processes in electron beam channels. Final report, November 13, 1981-October 30, 1983. Bardsley, J.N. (Pittsburgh Univ., PA (USA)). 11 May 1984. Contract W-7405-ENG-48. 17p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012972.

Calculations are presented of the rate of dissociative recombination of electrons with NO^+ ions. The computed rates agree with measured values at room temperature and lie between conflicting experimental values at high temperature. The effect of these calculations on the residual electron density in particle beam channels is discussed.

32509 (UCRL—92713) Mean life of the $2p^4(^1S)3s$ ^2S state in fluorine. Cheng, K.T.; Chen, M.H. (Lawrence Livermore National Lab., CA (USA)). 17 May 1985. Contract W-7405-ENG-48. 5p. (CONF-850560—5). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012929.

From Workshop on autoionization of atoms and small molecules; Argonne, IL, USA (2 May 1985).

In this work, we calculate the radiationless as well as the radiative decay rates for the $2p^4(^1S)3s$ ^2S state. For comparison purposes, we also make similar calculations for the $2p^4(^1D)4s$ ^2D state. Our calculation is based on the multi-configuration Dirac-Fock (MCDF) method. As spin-orbit interaction is built in, this method is capable of studying LS forbidden Auger transitions. Details of the Auger transition calculations have been given before. 9 refs.

32510 Structure and predissociation dynamics of electronically excited nitrogen dioxide: A resonance Raman study. Rohlfing, E.A.; Valentini, J.J. (Chemistry Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Chemical Physics;* **83**: No. 2, 521-528(15 Jul 1985).

Resonance Raman spectra of NO_2 have been recorded as a function of excitation frequency in the range 0—8000 cm^{-1} above the predissociation threshold. These spectra are interpreted using the time-dependent formulation of resonant Raman scattering, to elucidate the shape of the excited electronic state potential energy surface, and the dynamics which occur on it immediately following photoexcitation. Our results show that the dominant optical transition in this spectral range is $^2B_2$—$^2A_1$. Our Raman spectra reveal a marked decrease in the dynamical time scale of the predissociation of the $^2B_2$ state as excitation frequency increases. At excitation frequencies approximately 4850 cm^{-1} above the dissociation threshold, the $^2B_2$ predissociative lifetime becomes comparable to a vibrational period. We have analyzed the resonance Raman spectra, along with the absorption spectrum, to determine the magnitudes of the slopes of the potential surface along the symmetric stretch and bending normal coordinates for the $^2B_2$ excited state in the Frank—Condon region.

32511 Quantum mechanical reactive scattering via exchange kernels: Infinite order exchange on a grid. Dardi, P.S.; Shi, S.; Miller, W.H. (Department of Chemistry, and Materials and Molecular Research Division of the Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Journal of Chemical Physics;* **83**: No. 2, 575-583(15 Jul 1985).

A general methodology is described for carrying out quantum mechanical reactive scattering calculations. The approach is based on Miller's [J. Chem. Phys. 50, 407 (1969)] formulation of quantum reactive scattering in which rearrangement processes (i.e., chemical reactions) are characterized by nonlocal exchange interactions that couple different arrangements. The specific approach described here requires that nonreactive coupled channel calculations first be carried out separately in the various arrangements: this is a relatively standard inelastic scattering problem: and the non-local exchange interactions are then discretized on a grid in (translational) coordinate space; straightforward linear algebra calculations then lead to the scattering matrix. (Discretizing the exchange kernels on a grid is suggested because exchange is very short range.) The attractiveness of the overall method is its straightforwardness, generality, and special suitability for the vector-processing character of modern supercomputers. Application to a standard test problem (the collinear $H+H_2$ reaction) shows that it is numerically stable over a wide range of collision energies.

32512 Study of the isomeric dependence of low-energy (<10 eV) electron attachment: Perfluoroalkanes. Spyrou, S.M.; Hunter, S.R.; Christophorou, L.G. (Atomic, Molecular, and High Voltage Physics Group, Health and Safety Research Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831). *Journal of Chemical Physics;* **83**: No. 2, 641-654(15 Jul 1985). Contract AC05-84OR21400.

The attachment of low-energy (<10 eV) electrons to the open-chain i-C_4F_{10}, i-C_5F_{12}, neo-C_5F_{12}, and to the cyclic c-C_4F_8 and c-C_5F_{10} perfluoroalkanes has been studied using a time-of-flight mass spectrometer (TOFMS) and a high pressure electron swarm technique as well as the TOFMS results reported earlier on c-C_4F_8 and i-C_4F_{10}. Both long-lived parent anions (autodetachment lifetimes tau/sub a/ $>10^{-6}$ s) and dissociative attachment fragment anions were observed for these molecules in the mass spectrometric study. The relative cross sections for negative ion formation and the tau/sub a/ of the long-lived parent anions were measured as a function of electron energy in the mass spectrometric study. The absolute total electron attachment rate constants as a function of the mean electron energy have been measured in the swarm study and used to calculate the total electron attachment cross sections as a function of electron energy. Both studies have shown a strong dependence of dissociative and nondissociative electron attachment processes on the structure of the molecules studied. For neo-C_5F_{12}, the predominant anion is the fragment $C_4F^-{}_9$. In contrast, for i-C_4F_{10}, i-C_5F_{12}, c-C_4F_8, and c-C_5F_{10}, the parent anions are stronger than any of the fragment anions. Energetic considerations have been employed to identify fragmentation mechanisms of the negative ion states (NISs) leading to the formation of the observed fragment anions and to deduce some thermochemical data.

32513 Charge transfer: An electronic bath approach. McDowell, H.K. (Los Alamos National Laboratory, University of California, Los Alamos, New Mexico 87545). *Journal of Chemical Physics;* **83**: No. 2, 772-780(15 Jul 1985).

A charge transfer theory is developed for systems in which an atom, molecule, or ion interacts for a period of time with a substrate. The Hamiltonian of the system is taken to be one-electron and the nuclear motion of the substrate is ignored. The theory is structured so as to mimic generalized Langevin theory; namely, the equations of motion for annihilation operators of spin orbitals localized at the interaction site are developed such that a primary zone is defined with the remainder of the substrate being included through a memory kernel and a driving term. An electronic bath approximation is presented which leads to equations of motion for the occupation numbers of spin orbitals in the primary zone. These equations have the property that primary-zone occupation numbers damp to an equilibrium state at long time independent of their initial values. Specific application to a substrate modeled as a semi-infinite, Huckel chain is presented and numerical results are obtained. The electronic bath approximation is found to produce results in agreement with numerically exact data.

32514 Computation of two surface properties by coordinate-space propagator techniques. Coalson, R.D. (Theoretical Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Chemical Physics;* **83**: No. 2, 688-697(15 Jul 1985).

The time-dependent two-surface formalism (used to calculate electronic absorption spectra, Raman excitation profiles, etc.) is recast so as to enable the employment of recently developed coordinate space propagator techniques in the computation of the relevant time kernels. Two classes of propagator methods are discussed in connection with the two-surface problem: matrix multiplication of discretized short-time propagators and Monte Carlo path integration. As a nontrivial test case, the matrix multiplication procedure is successfully utilized to extract a high resolution finite temperature electronic absorption spectrum involving displaced one-dimensional Morse wells.

32515 Rydberg states of the ArCO$_2$ and KrCO$_2$ van der Waals molecules. Dehmer, P.M. (Argonne National Laboratory, Argonne, Illinois 60439). *Journal of Chemical Physics;* **83**: No. 1, 24-33(1 Jul 1985). Contract W-31-109-ENG-38.

Relative photoionization cross sections were determined for ArCO$_2$ at a wavelength resolution of 0.24 A in the regions of both the Ar*+CO$_2$ and the Ar+CO($_2$ dissociation limits (690—920 A) and for KrCO$_2$ at a wavelength resolution of 0.4 A in the region of the Kr+CO($_2$ dissociation limits (690—780 A). The dimer ionization potentials are 13.59 +- 0.04 eV (912.5 +- 2.5 A) for ArCO$_2$ and 13.33 +- 0.04 eV (930.0 +- 3.0 A) for KrCO$_2$. Combining these values with the known value of the CO$_2$ ionization potential and the known (or estimated) values of the ArCO$_2$ and KrCO$_2$ dissociation energies yields values for the dimer ion ground state dissociation energies of 0.20 +- 0.04 eV for ArCO$^+{}_2$ and 0.47 +- 0.05 eV for KrCO$^+{}_2$. Rydberg structure is observed in the photoionization cross section of ArCO$_2$ corresponding to dissociation limits of the type Ar*(nd,ns)+CO$_2$; however, discrete structure is observed only near the Ar*(3d,5s)+CO$_2$ dissociation limits. van der Waals structure corresponding to the higher Ar*+CO$_2$ limits is diffuse and red degraded. Molecular Rydberg structure also is observed in the photoionization cross sections of both ArCO$_2$ and KrCO$_2$ corresponding to dissociation limits of the type Ar+CO($_2$.

32516 Measurement and analysis of the infrared-active stretching fundamental (νa) of UF$_6$. Aldridge, J.P.; Brock, E.G.; Filip, H.; Flicker, H.; Fox, K.; Galbraith, H.W.; Holland, R.F.; Kim, K.C.; Krohn, B.J.; Magnuson, D.W.; Maier W.B. II; McDowell, R.S.; Patterson, C.W.; Person, W.B.; Smith, D.F.; Werner, G.K. (University of California, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Chemical Physics;* **83**: No. 1, 34-48(1 Jul 1985).

High-resolution spectra of the infrared-active stretching fundamental ν_3 of ^{238}UF$_6$ have been obtained between 620.6 and 633.5 cm^{-1} using tunable semiconductor diode lasers. Interference from hot bands was suppressed by cooling the UF$_6$ in a supersonic expansion, and useful monomer concentrations were produced with effective temperatures of $<$100 K. Portions of the band from P(77) to R(66) are illustrated. All transitions from the vibrational ground state have been assigned, and the Q branch has been fully analyzed. A total of 43 line frequencies and 110 frequency differences extending in J to P(77), Q(91), and R(67) has been used to fit seven spectroscopic constants. The ground- and excited-state values of the rotational constant B could be individually determined, and the U—F bond length in the ground vibrational state is r_0 = 1.9962 +- 0.0007 A. The Q branch of ^{235}UF$_6$ has also been analyzed and the ^{235}UF$_6$—^{238}UF$_6$ ν_3 isotope shift measured to be 0.603 79 +- 0.000 17 cm^{-1}. The isotope shift and the Coriolis constant zeta$_3$ have been used to refine the general quadratic intramolecular force field of UF$_6$, and the Cartesian displacement coordinates of both infrared-active fundamentals are illustrated and compared with those of SF$_6$.

32517 Ab initio study of cyanogen: The X $^1u^+$/sub g/, a $^3\Sigma^+$/sub u/, B $^1\Delta$/sub u/, and C ^{1}Pi/sub u/ states. Dateo, C.E.; Dupuis, M.; Lester W.A. Jr. (Materials and Molecular Research Division, Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Journal of Chemical Physics;* **83**: No. 1, 265-272(1 Jul 1985). Contract AC03-76SF00098.

An ab initio multiconfiguration Hartree—Fock (MCHF) study of the X $^1\Sigma^+$/sub g/, a $^3\Sigma^+$/sub u/, B $^1\Delta$/sub u/, and C ^{1}Pi/sub u/ states of cyanogen (C$_2$N$_2$) is presented. Equilibrium structures, harmonic vibrational frequencies, excitation energies, and dissociation energies have been calculated and found to be in semiquantitative agreement with available experimental data. This study confirms the $\pi \rightarrow \pi^*$ character of C$_2$N$_2$ (a $^3\Sigma^+$/sub u/) and C$_2$N$_2$ (B $^1\Delta$/sub u/), and the n $\rightarrow \pi^*$ character of C$_2$N$_2$ (C ^{1}Pi/sub u/) near their equilibrium structures. Configuration mixing among the n and π electrons is needed to correct the broken symmetry description given by the Hartree—Fock (HF) method, and leads to a qualitatively correct representation of these states. For C$_2$N$_2$ (a $^3\Sigma^+$/sub u/) and C$_2$N$_2$ (B $^1\Delta$/sub u/), the harmonic force constants show a strong through-bond interaction which is due to the dominance of the charge transfer configuration $^+$NCCN$^-$.

32518 Vibrational energy transfer in HBr—C$_2$D$_2$ mixtures. Breshears, W.D.; Smith, I.W.M. (Department of Physical Chemistry, University Chemical Laboratories, Lensfield Road, Cambridge CB2 1EP, England). *Journal of Chemical Physics;* **83**: No. 1, 140-144(1 Jul 1985).

Infrared fluorescence from HBr and C$_2$D$_2$(ν_3) has been measured following irradiation of HBr—C$_2$D$_2$ mixtures with a pulsed HBr laser. The fluorescence decay from both species yields the total rate constant for deactivation of HBr(v = 1) by collisions with C$_2$D$_2$, k = (1.6 +- 0.1) x 10^4 s^{-1} Torr^{-1}. The exponential rise of C$_2$D$_2$(ν_3) fluorescence is characterized by the rate constants k = (3.4 +- 0.2) x 10^4 s^{-1} Torr $^{-1}$ for collisions with both C$_2$D$_2$ and HBr, and k = (5.5 +- 2.3) x 10^3 s^{-1} Torr^{-1} for collisions with added Ar. A model developed to fit the observations implies that ν_3 is populated indirectly by transfer from another, unidentified, level of C$_2$D$_2$, and that the exponential rise constants refer to transfer from ν_3 to this level.

32519 Vibrational excitation of CH$_3$F by collisions with "hot" H and D atoms. McGee, T.H.; Weston R.E. Jr.; Flynn, G.W. (Department of Chemistry, Brookhaven National Laboratory, Upton, New York 11973). *Journal of Chemical Physics;* **83**: No. 1, 145-148(1 Jul 1985). Contract AC02-78ER04940.

Hot hydrogen atoms have been produced by photolysis of HBr, HI, and H$_2$S at 193 nm, and HI at 248 nm; D atoms were produced by photolysis of D$_2$S at 193 nm. Vibrational excitation of CH$_3$F in collisions with these hot atoms has been observed by detection of infrared emission at 3.3 μm (ν_1, ν_4) and 9.6 μm (ν_3). Relative probabilities for excitation of these modes have been determined, and the ν_3/ν_1, ν_4 ratio is much larger than is predicted by simple impulsive models. The "isotope effect," i.e., relative excitation by H atoms compared to D atoms, is 1.4 for both vibrational modes.

32520 Detection of the bending fundamental band of DN$^+$Z by diode laser absorption spectroscopy. Sears, T.J. (Department of Chemistry, Brookhaven National Laboratory, Upton, New York 11973). *Journal of Chemical Physics;* **82**: No. 12, 5757-5758(15 Jun 1985).

The detection of 28 rotational lines in the bending fundamental band of DN$^+{}_2$ is reported. The spectra were obtained in a modulated discharge of D$_2$ and N$_2$ in a large hollow cathode which was cooled to liquid nitrogen temperature. Analysis leads to accurate values for the band origin and all of the major parameters describing the (01^{1}0) state of the ion.

32521 Photoelectron spectrum of ArXe obtained using resonantly enhanced multiphoton ionization. Pratt, S.T.; Dehmer, P.M.; Dehmer, J.L. (Argonne National Laboratory, Argonne, Illinois 60439). *Journal of Chemical Physics;* **82**: No. 12, 5758-5760(15 Jun 1985).

The photoelectron spectrum of the heteronuclear rare gas dimer ArXe was determined using resonantly enhanced multiphoton ionization-photoelectron spectroscopy (REMPI-PES). Three photoelectron peaks are observed corresponding to the production of ArXe$^+$ in the A$^2\Sigma^+$/sub 1/2/ B^{2}Pi$_3$/sub //$_2$, and B^{2}Pi$_1$/sub //$_2$ states. The kinetic energies of these peaks are used to determine lower limits for the dissociation energies of the ionic states.

32522 **State-to-state study of the symmetric charge transfer reaction Ar$^+$(^{2}P/sub 3/2,1/2/)+Ar(^{1}S$_0$).** Liao, C.; Liao, C.; Ng, C.Y. (Ames Laboratory, U. S. Department of Energy, and Department of Chemistry, Iowa State University, Ames, Iowa 50011). *Journal of Chemical Physics;* **82**: No. 12, 5489-5498(15 Jun 1985). Contract W-7405-ENG-82.

The relative state-to-state total charge transfer cross sections, σ/sub 3/2arrow-right3/2/, σ/sub 3/2arrow-right1/2/, σ/sub 1/2arrow-right1/2/, and σ/sub 1/2arrow-right3/2/, for the reactions Ar$^+$(^{2}P$_3$/sub //$_2$)+Ar(^{1}S$_0$) → Ar(^{1}S$_0$)+Ar$^+$(^{2}P$_3$/sub //$_2$)= GFIX → Ar(^{1}S$_0$)+Ar$^+$(^{2}P$_1$/sub //$_2$), Ar$^+$(^{2}P$_1$/sub //$_2$)+Ar(^{1}S$_0$) → Ar(^{1}S$_0$)+Ar$^+$(^{2}P$_1$/sub //$_2$) GFIX → Ar(^{1}S$_0$)+Ar$^+$(^{2}P$_3$/sub //$_2$), respectively, at the laboratory collision energy range of 1—4000 eV, have been determined using the newly constructed crossed ion—neutral beam

32523 **Evidence for uncorrelated electron capture and K-shell excitation in S^{13+} VHe collisions.** Tanis, J.A.; Bernstein, E.M.; Clark, M.W.; Graham, W.G.; McFarland, R.H.; Morgan, T.J.; Johnson, B.M.; Jones, K.W.; Meron, M. (Department of Physics, Western Michigan University, Kalamazoo, Michigan 49008). *Physical Review [Section] A: General Physics;* **31**: No. 6, 4040-4042(Jun 1985).

Evidence is presented for a two-step process in ion-atom collisions in which two independent interactions occur in a single encounter. Measurements for 15—200-MeVS^{13+} +He collisions indicate that uncorrelated projectile K-shell excitation and capture of a target electron occur in a single collision with one target atom. The results are in reasonable qualitative agreement with theoretical predictions of this two-step process.

32524 **New target cell design for alkali and alkaline earth vapor scattering experiments.** Coggiola, M.J.; Peterson, J.R.; Leon, R.L. (Chemical Physics Laboratory, SRI International, Menlo Park, California 94025). *Review of Scientific Instruments;* **56**: No. 6, 1248-1252(Jun 1985). Contract AT03-80ER53091.

A scattering cell is described that is suitable for use with targets of alkali and alkaline earth vapors in beam-static gas collision experiments. A novel feature of this vapor oven design is that the entire assembly can be rapidly moved into and out of the projectile beam path. When used with fixed beam defining apertures, this arrangement results in greatly simplified total scattering cross-section measurements using an attenuation technique. Examples of cross sections measured in this way are presented for electron capture and loss by D$^+$/D$^-$ in a Cs target between 0.1 and 4.0 keV/amu.

32525 **Effect of optical saturation on hyperfine intensities in optogalvanic spectroscopy.** Engleman R. Jr.; Keller, R.A.; Miller, C.M. (Chemistry Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of the Optical Society of America B: Optical Physics;* **2**: No. 6, 897-902(Jun 1985). Contract W-7405-ENG-36.

The hyperfine structure of the 22 125-cm^{-1}, ^{2}D/sup degree//sub 3/2/ ← ^{2}D/sub 3/2/ lutetium transition has been examined by both Fourier transform emission and laser optogalvanic spectroscopy. The component intensities of the Fourier-transform spectrum closely agree with classical intensities. The optogalvanic spectra show progressively larger deviations from classical intensities as the laser power is increased. Introduction of a single optical saturation parameter into the intensity formula is sufficient to fit the observed intensities even at high laser powers. These spectra were used to derive accurate values for the ^{175}Lu line origin, the upper-state hyperfine constants of ^{175} Lu, and the isotope shift between ^{176}Lu and ^{175} Lu.

32526 **Interpreting coherent anti-Stokes Raman spectra measured with multimode Nd:YAG pump lasers.** Farrow, R.L.; Rahn, L.A. (Combustion Research Facilities, Sandia National Laboratories, Livermore, California 94550). *Journal of the Optical Society of America B: Optical Physics;* **2**: No. 6, 903-907(Jun 1985).

We report comparisons of coherent anti-Stokes Raman spectroscopy (CARS) measurements using single-axial-and multiaxial-mode Nd:YAG lasers. Our results demonstrate the validity of a recently proposed convolution expression for unresolved CARS spectra. The results also support the use of a relative delay of several coherence lengths between pump-beam paths for reducing the effects of pump-field statistics on the CARS spectral profile.

32527 **Muonic atoms with vacant electron shells.** Bacher, R.; Gotta, D.; Simons, L.M.; Missimer, J.; Mukhopadhyay, N.C. (Kernforschungszentrum Karlsruhe, Institut fuer Kernphysik und Universitat Karlsruhe, Institut fuer Experimentelle Kernphysik, Karlsruhe, Federal Republic of Germany). *Physical Review Letters;* **54**: No. 19, 2087-2090(13 May 1985). Contract AC02-83ER40114.

We show that the cascade in muonic atoms with $Z<20$ ejects sufficient atomic electrons to ionize an isolated muonic atom completely. In gases, the rates with which electrons refill the atomic shell can be accurately deduced from measured and calculated electron transfer cross sections. Thus, we can conclude that completely ionized muonic atoms can be prepared in gases, and that they remain isolated for long enough times at attainable pressures to facilitate studies of fundamental interactions in muonic atoms.

32528 **Vibrational relaxation in H_2 molecules by wall collisions: Applications to negative ion source processes.** Karo, A.M.; Hiskes, J.R.; Hardy, R.J. (Lawrence Livermore National Laboratory, Livermore, California 94550). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1222-1228(May 1985). Contract W-7405-ENG-48.

In the volume of a hydrogen discharge, H_2 molecules, excited to high vibrational levels ($v''>6$), are formed either by fast-electron collisions or from $H^+{}_2$ ions that are accelerated across the discharge-wall potential that undergo Auger neutralization prior to impact with the discharge chamber wall. We have used computer molecular dynamics to study the deexcitation and reexcitation of vibrationally excited H_2 molecules undergoing repeated wall collisions. The initial translational energies range from thermal to 100 eV and the initial vibrational states range from $v'' = 2$ to $v'' = 12$. The average loss or gain of vibrational, rotational, translational, and total molecular energies and the survival rates of the molecules have been evaluated. At thermal energies vibrational deexcitation is the predominant process, and a consistent picture emerges of rapid energy redistribution into all the molecular degrees of freedom and a slower rate of loss of total molecular energy to the wall. At higher translational energies (1—100 eV) a substantial fraction of the molecules survives with large ($v''>6$) vibrational energy. This vibrational population provides a contribution to the total excited vibrational population comparable to that from the fast-electron collision process. Implications of these results for negative ion generation will be discussed.

32529 **Hydrogen vibrational population distributions and negative ion generation in tandem high density hydrogen discharges.** Hiskes, J.R.; Karo, A.M.; Willmann, P.A. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1229-1233(May 1985). Contract W-7405-ENG-48.

The tandem high-density hydrogen negative-ion-source system is optimized to identify the largest possible ion concentrations and extracted ion currents. The optimization includes varying the length of the second chamber, varying neutral gas and electron densities, and varying the ratio of atomic to molecular density. Vibrational excitation occurs via high-energy electron excitation (E—V process) and $H^+{}_2$ surface neutralization (s—V process). These processes are considered separately and acting in parallel. The solutions are presented in terms of a dimensional scale factor R. For a system scale length R = 1 cm, optimum extracted current densities are in the range 50 to 100 mA cm^{-2}. A single-chamber s—V system with the high-energy electron component suppressed can provide larger ion concentrations than a tandem E—V, s—V system.

32530 Observation of the *ν*Z (bending) fundamental of the HN_2^+ ion at 14.6 micrometers. Sears, T.J. (Department of Chemistry, Brookhaven National Laboratory, Upton, New York 11973). *Journal of the Optical Society of America B: Optical Physics;* **2**: No. 5, 786-789(May 1985). Contract AC02-76CH00016.

Twenty vibration-rotation lines in the bending fundamental of HN_2^+ have been detected by absorption spectroscopy using a tunable-diode laser. The ions were produced in a large hollow-cathode discharge in a mixture of hydrogen and nitrogen maintained at liquid-nitrogen temperature. Analysis of the spectrum provides an accurate determination of the ν_2 band origin and the major parameters describing the (01 ^{1}0) state of the ion.

32531 Orientation dependence of the H + D_2 reaction cross section: steric model vs. trajectory calculations. Blais, N.C.; Bernstein, R.B.; Levine, R.D. (Los Alamos National Lab., NM). *Journal of Physical Chemistry;* **89**: No. 1, 10-13(3 Jan 1985).

Quasiclassical trajectory calculations of the orientation dependence of the cross section for the $H + D_2 \rightarrow HD + D$ reaction have been carried out at collision energies of 0.55 and 1.30 eV. The results are well approximated by the angle-dependent barrier, line-of-centers steric model of Levine and Bernstein. 18 references, 3 figures, 1 table.

32532 Search for stationary points on surfaces. Banerjee, A.; Adams, N.; Simons, J.; Shepard, R. (Univ. of Utah, Salt Lake City). *Journal of Physical Chemistry;* **89**: No. 1, 52-57(3 Jan 1985). Contract W-31-109-ENG-38.

Algorithms for finding local minima, maxima, and saddle points on surfaces, starting from an arbitrary point are presented. These algorithms are based on making a local approximation to the surface in the form of a rational function constructed from the local first and second derivatives of the surface. All parameters of these algorithms required for stepping across the surface are determined in nonarbitrary ways. The convergence of these procedures to the desired stationary point is shown to be quadratic. Applications for stationary-point searches on two model surfaces are also given for illustrative purposes. 12 references, 4 figures.

32533 Spectroscopic constants for tritiated and deuterated H3(+). Carney, G.D. (Allegheny College, Meadville, PA). *Canadian Journal of Physics;* **62**: 1871-1874(Dec 1984).

Theoretical vibration-rotation coefficients for tritiated and deuterated H3(+) are reported for Carney and Porter's (1974) ab initio electronic Cl potential energy surface. In the calculation of coefficients connecting the zero-point and fundamental states of vibration, accurate vibrational Cl wave functions consisting of 220 configuration functions were used.

32534 (AD-A—150145/1/XAB) Ion transport in beam-plasma interactions. Annual report, 30 September 1983-30 September 1984. Stern, R.A. (Colorado Univ., Boulder (USA)). 30 Sep 1984. 8p. NTIS, PC A02/MF A01.

This interm report covers work performed on the topic of laser-fluorescence measurements of ion beam scattering and transport of background ions during beam-plasma interactions. Achievements to date include (1) construction and operation of the plasma device, (2) assembly of a diagnostic pulsed laser, and (3) assembly and emplacement of the detection system. Future work plans, personnel changes and general scientific activities are described.

32535 (AD-A—151225/0/XAB) Plasma initiation/flow chamber to study cw-laser-beamed energy absorption in light gases. Annual report, 1 February 1983-30 January 1984. Krier, H.; Mazumder, J.; Glumb, R.J.; Bender, T.D.; Rockstroh, T.J. (Illinois Univ., Urbana (USA). Dept. of Mechanical and Industrial Engineering). 1 Mar 1984. 75p. (UILU-ENG—84-4002). NTIS, PC A04/MF A01.

This report summarizes the research work of the past year, investigating the use of laser-sustained plasmas for propulsion applications. One focus of the research is the initiation of plasmas in inert gases using metal-vapor seedants. Another is to define the operating characteristics of the dual-flow design by measuring temperatures, number densities, and global absorption. A pressure chamber was built to permit observations of the plasma under wide ranges of pressure, flow conditions, and beam geometry. Laser energy absorption will be measured using a high -flux calorimeter, and temperature profiles will be found using a combination of spectroscopic relative line-intensity measurements, thermocouples, infrared thermography, and possible laser-induced fluorescence. The report summarizes the design and construction of the pressure chamber, optics, and related equipment, and discusses the techniques that will be used to analyze temperatures throughout the flowfield.

32536 (AD-A—151502/2/XAB) Electric-discharge excitation and energy source integration. Final report, 30 January 1980-31 December 1983. Grosjean, D.F. (Systems Research Labs., Inc., Dayton, OH (USA). Research Applications Div.). 6 Jan 1985. 170p. (SRL—6569). NTIS, PC A08/MF A01.

Methods of transferring energy from electrical storage to an electro-negative gas discharge at high repetition rates of approx < 1.5 kHz are examined. The electrical-energy range of interest is 1 - 10 J. The XeC1 gas-discharge laser system is used as a representative discharge. Computer modeling of the pertinent kinetics of a He/Xe/HC1 gas mixture which was performed in conjunction with various configurations of pulse-forming networks is described; gas thyratrons and magnetic switches were used as switching elements. Due to the relatively constant E/N characterisitics of this system, a stripline arrangement is shown to provide the most efficient method of energy transfer for pulse lengths approx < 50 nsec. Capacitor discharge methods are applicable to shorter pulse lengths. Construction of a closed-cycled, high-rep-rate XeC1 gas-discharge laser is described. Operation of an x-ray preionized system at 1.5 kHz is also detailed; no contamination was observed in this configuration. The application of the XeC1 laser as a pump source for a high-rep-rate, high-average-power dye laser is also described. A flowing-dye jet was utilized in order to avoid liquid-cell boundary-layer problems of a fast-flow stream. The optical quality of the jet stream was the limiting factor in achieving the power goals. A method of achieving high efficiency in a rare-gas-halide system is proposed via a magnetic switch and prepulse arrangement in conjunctions with a stripline PFN. A high-efficiency pulse-charging source is also described.

Two-point Pade approximants are employed to interpolate between the known high - and low - density ground state energy expansions for the electron gas problem to predict the paramagnetic-tpo-ferromagnetic transition point in excellent agreement with recent computer simulations.

32538 (K/TS—11-516) Stability of Timoshenko beams conveying a compressible fluid. Johnson, R.O. (Oak Ridge Gaseous Diffusion Plant, TN (USA)). Dec 1984. Contract AC05-84OT21400. 189p. NTIS, PC A09/MF A01; GPO Dep. File Number DE85013096.

Thesis. Submitted to the Univ. of Tennessee, Knoxville.

The purpose of this study is to formulate and solve the stability problem associated with the equations of motion of a Timoshenko beam conveying a compressible fluid. The beam is assumed to be either cantilevered or simply supported. Shear deformation and rotary inertia are considered in the Timoshenko beam theory. The beam analysis that is carried out is quite general and allows for viscous damping external to the tube as well as both internal strain rate and hysteretic damping. Interactions between these three damping mechanisms, shear deformation, and rotary inertia are also accounted for. The compressible, isentropic flow through the tube is governed by Euler's equations of motion. Gravitational effects are neglected in the analysis. This is equivalent to assuming that the tube is horizontal. The motion of the fluid is coupled to that of the beam by a compatibility condition at the tube wall which requires that they vibrate together. 132 refs., 39 figs., 13 tabs.

32539 **(LA-UR—85-1049) Gradient scaling for nonuniform meshes.** Margolin, L.G.; Ruppel, H.M.; Demuth, R.B. (Lawrence Livermore National Lab., CA (USA); Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 13p. (CONF-850745—7). NTIS, PC A02/MF A01; GPO Dep. File Number DE85009625.

From 4. international conference on numerical methods in laminar and turbulent flow; Swansea, UK (8 Jul 1985).

This paper is concerned with the effect of nonuniform meshes on the accuracy of finite-difference calculations of fluid flow. In particular, when a simple shock propagates through a nonuniform mesh, one may fail to model the jump conditions across the shock even when the equations are differenced in manifestly conservative fashion. We develop an approximate dispersion analysis of the numerical equations and identify the source of the mesh dependency with the form of the artificial viscosity. We then derive an algebraic correction to the numerical equations - a scaling factor for the pressure gradient - to essentially eliminate the mesh dependency. We present several calculations to illustrate our theory. We conclude with an alternate interpretation of our results. 14 refs., 5 figs.

32540 **(SAND—85-0111) Preliminary considerations for the gasdynamic precompression of solid molecular hydrogen.** Barker, L.M.; Trucano, T.G.; Asay, J.R.; Wise, J.L. (Sandia National Labs., Albuquerque, NM (USA)). Mar 1985. Contract AC04-76DP00789. 74p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85013256.

In this report, we present a preliminary examination of the feasibility of quasi-isentropically compressing solid or liquid molecular hydrogen to multi-megabar pressures by means of a gas-cushioned projectile impact experiment. The primary purpose for using a gas-cushioned projectile is to prevent large temperature increases in the sample. We present initial experimental design concepts, and a series of one-dimensional Lagrangian computations that demonstrate the feasibility of the experimental concepts. We briefly discuss the expected temperature rises in the hydrogen sample undergoing continuous compression, and contrast them with the temperature rises expected in direct shock loading. This experimental procedure will allow the acquisition of very high pressure data which are beyond the range of diamond-anvil cell technology. Since the estimated peak pressures of the experiment are within theoretical predictions of the metal-insulator transition in molecular hydrogen, the proposed experiment will directly probe the existence of this transition. The molecular-to-metallic transition in hydrogen is a subject of current importance in solid-state physics. 34 refs., 29 figs., 2 tabs.

32541 **(UNICP-J—83) Progress report 1 October 1980-30 September 1983 of the section 'Plasma Physics' of the 'Institute for Theoretical Physics' at the Leopold Franzens University, Innsbruck, Austria.** Cap, F. (Innsbruck Univ. (Austria)). Jan 1984. 20p. (In German). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701536.

32542 **Normalization constraint for variational bounds on fluid permeability.** Berryman, J.G.; Milton, G.W. (Lawrence Livermore National Laboratory, P. O. Box 808, L-201, Livermore, California 94550). *Journal of Chemical Physics;* **83**: No. 2, 754-760(15 Jul 1985).

A careful reexamination of the formulation of Prager's original variational principle for viscous flow through porous media has uncovered a subtle error in the normalization constraint on the trial functions. Although a certain surface integral of the true pressure field over the internal surface area always vanishes for isotropic materials, the corresponding surface integral for a given trial pressure field does not necessarily vanish but has nevertheless been previously neglected in the normalization. When this error is corrected, the form of the variational estimate is actually simpler than before and furthermore the resulting bounds have been shown to improve when the constant trial functions are used in either the two-point or three-point bounds.

32543 **Numerical solution of the Graetz problem for a bingham plastic in laminar tube flow with constant wall temperature.** Blackwell, B.F. (Centrifuge, Climatic and Radiant Heat, Division 7531, Sandia National Laboratories, Albuquerque, N. M. 87185). *Journal of Heat Transfer;* **107**: No. 2, 466-471(May 1985). Contract AC04-76DP00789.

The Sturm-Liouville equation is used to study:m the heat transfer properties of aqueous foams used as a drilling fluid. (AIP)

32544 **Velocity and vorticity correlations.** Berger, B.S. (University of Maryland). *Quarterly of Applied Mathematics;* **43**: No. 1, 97-126(Apr 1985). Contract AS05-81ER10809.

It is shown that one point velocity correlations may be expressed as a volume integral of the product of the singular part of Green's function and a function, h/sub j/m(x,X), which satisfies Poisson's equation and vanishes for points on the boundary. An explicit expression is found for h/sub j/m(x,X). These results provide a computational method for determining the velocity correlations.

32545 **Numerical study of gravity currents in a channel.** Wang, D. (Energy and Environmental Systems Division, Argonne National Laboratory, Argonne, IL 60439). *Journal of Physical Oceanography;* **15**: No. 3, 299-305(Mar 1985).

A three-dimensional, primitive-equation model was used to study gravity currents produced by instantaneous releases of a buoyant fluid in a rectangular channel. Without rotation, the gravity current passes through two distinct phases: an initial adjustment phase in which the front speed is constant, and an eventual self-similar phase in which the front speed decreases with time. With rotation, the gravity current is confined to the right-hand wall, forming a coastal jet. The initial front-speed is constant; however, the front speed decreases rapidly due to strong mixing at the horizontal edge of the gravity current. Also, with rotation, part of the buoyant fluid is trapped near the source region, forming an anticyclonic vortex.

32546 **Second-order theory of electromagnetic hot ion beam instabilities.** Gary, S.P.; Tokar, R.L. (Earth and Space Sciences Division, Los Alamos National Laboratory, New Mexico). *Journal of Geophysical Research;* **90**: No. A1, 65-72(1 Jan 1985).

The wave-particle interactions of a hot ion beam streaming along a magnetic field B are studied. A second-order theory of electromagnetic instabilities in a homogeneous, collisionless plasma at propagation parallel to B is used. The two instabilities most likely to be driven by a hot beam are the right-hand and left-hand resonant ion beam instabilities. If the conditions necessary for the validity of the theory are met, the two modes are found to reinforce one another. That is, each mode acts to produce a beam anisotropy which reduces its own growth rate but enhances the growth rate of the other. Thus this theory predicts that whenever sufficiently hot or "diffuse" ions are found at a collisionless shock and the plasma is sufficiently homogeneous that significant wave growth is possible, ion beam instabilities will act to produce a mixture of both right- and left-hand polarized MHD-like waves.

32547 **Plasma heating at collisionless shocks due to the kinetic cross-field streaming instability.** Winske, D.; Tanaka, M.; Wu, C.S.; Quest, K.B. (Institute for Fusion Studies, Hiroshima University, Japan). *Journal of Geophysical Research;* **90**: No. A1, 123-136(1 Jan 1985).

Heating at collisionless shocks due to the kinetic cross-field streaming instability, which is the finite beta (ratio of plasma to magnetic pressure) extension of the modified two stream instability, is studied. Heating rates are derived from quasi-linear theory and compared with results from particle simulations to show that electron heating relative to ion heating and heating parallel to the magnetic field relative to perpendicular heating for both the electrons and ions increase with beta. The simulations suggest that electron dynamics determine the saturation level of the instability, which is manifested by the formation of a flattop electron distribution parallel to the magnetic field. As a result, both the saturation levels of the fluctuations and the heating rates decrease sharply with beta. Applications of these results to plasma heating in simulations of shocks and the earth's bow shock are described.

32548 **Ion and electron heating at collisionless shocks near the critical Mach number.** Thomsen, M.F.; Gosling, J.T.; Bame, S.J.; Mellott, M.M. (Los Alamos National Laboratory, New Mexico). *Journal of Geophysical Research;* **90**: No. A1, 137-148(1 Jan 1985).

The evolution of the ion and electron distribution functions across a set of 10 low-Mach number, nominally subcritical, quasi-perpendicular shocks is examined in high time resolution (full distribution every 3 s) using data from the ISEE 1 and 2 spacecraft. Both ions and electrons sometimes show slight preheating upstream of the shock, but otherwise the ion and electron temperatures rise together in the magnetic ramp and show no further increase downstream. Contrary to the usual assumption based on early laboratory and theoretical work that at subcritical shocks the bulk of the energy dissipation occurs as resistive heating of the electrons, it is found that the ion temperature increase exceeds that of the electrons. The difference is attributed to the distinction between dispersive shocks, such as those studied here, and resistive shocks, such as those observed in most laboratory studies. The increase in ion temperature is predominantly in the perpendicular direction and is due to heating of the entire distribution rather than to the formation of a high-energy tail. The perpendicular temperature increase is typically a factor of 10—20, much greater than the usual assumption of adiabatic heating. The downstream to upstream ratio of perpendicular electron temperature is equal to the magnetic field ratio (~2—2.5). The electrons also show significant heating in the parallel direction, with the downstream T/sub parallel//T/sub perpendicular/ ~1—1.2. The downstream electron distribution exhibits the characteristic flattop seen downstream of supercritical shocks, and there is evidence for the field-aligned electron beam identified previously within those shocks. As previously reported, the downstream ion and electron total temperatures are nearly equal.

32549 **Essential spectrum of ideal magnetohydrodynamics.** Hameiri, E. (New York Univ., NY). *Communications on Pure and Applied Mathematics;* **38**: 43-66(Jan 1985). Contract AC02-76ER03077.

The essential spectrum of magnetohydrodynamics is shown to arise from waves propagating one-dimensionally along magnetic field lines. Different polarizations of these waves give rise to the Alfven and ballooning spectra. The essential spectrum of an axisymmetric equilibrium when a single azimuthal mode number is considered consists of the Alfven spectrum only, while the ballooning modes appear as intervals of accumulation of discrete eigenvalues with different mode numbers. Some necessary and one sufficient conditions for stability are derived, and some examples where the criteria coincide to yield a simple condition for stability are shown. 29 references.

32550 **Review-of-Particle-Properties system.** Trippe, T.G. (Lawrence Berkeley Lab., CA (USA). Particle Data Group). *Computer Physics Communications;* **33**: No. 1-3, 229-233(Aug-Sep 1984). (CONF-8306255—).

From 5. summer school on computing technics in physics: data bases and data structures in physics; Bechyne, Czechoslovakia (21 Jun 1983).

The Berkeley Particle Data Group is engaged in a major modernization of its primary project, the Review of Particle Properties, a compilation of experimental data on elementary particles. The goal of this modernization is to develop an integrated system for data storage, manipulation, interactive access and publication using modern technqiues for database management, text processing and phototypesetting. The existing system and the plans for modernization are described. The group's other projects and the computer systems used are also discussed.

32551 **(BONN-HE—84-36) Experimental results on hadron pair production by two photons.** Kueck, H. (Bonn Univ. (Germany, F.R.). Physikalisches Inst.). Nov 1984. 31p. (CONF-8409194—4). NTIS (US Sales Only), PC A03/MF A01. File Number DE85751625.

From 6. international workshop on photon-photon collisions; Lake Tahoe, CA, USA (9 Sep 1984).

This report reviews the experimental results on non-resonant exclusive production of hadron pairs in photon-photon collisions. The cross section for charged pion pairs in the invariant mass range below the f resonance is discussed. The measured cross sections show no evidence for scalar resonances. At momentum transfer vertical stroketvertical stroke > 1.6 GeV^2 the sum of the cross sections for charged pion and kaon pairs are found to be in remarkable agreement with a theoretical model based on perturbative QCD. Cross sections for proton-antiproton production and upper limits on Λanti Λ, Δanti Δ production are discussed.

32552 **(CERN-EP—82-99) Hadronic final states in deep inelastic muon interactions.** Dosselli, U. (European Organization for Nuclear Research, Geneva (Switzerland)). 15 Jul 1982. 33p. (CONF-8205304—1). NTIS (US Sales Only), PC A03/MF A01. File Number DE85901016.

From 5. Warsaw symposium on elementary particle physics; Kazimierz, Poland (1 May 1982).

New data on the hadronic final states produced in deep inelastic interactions of muons are presented and compared with theoretical models. Some preliminary results on hadron production from scattering on nuclear targets are also reported.

32553 **(CERN-EP—84-125) Message from light ions: an experimental review of the search for abnormal phenomena in high-energy nucleus-nucleus collisions.** Szwed, R. (Warsaw Univ. (Poland). Inst. From 4. international conference on ultrarelativistic nucleus-nucleus collisions - QUARK MATTER '84; Helsinki, Finland (17 Jun 1984).

The experimental data from the CERN intersecting Storage Rings (ISR) and from Dubna and Berkeley on the search for abnormal nuclear phenomena in high-energy nucleus-nucleus collisions is reviewed. 48 refs.

32554 **(DESY—84-043) Production and decay of the F-meson in e^+e^- annihilation at 10 GeV centre-of-mass energy.** Albrecht, H.; Binder, U.; Drews, G.; Harder, G.; Hasemann, H.; Philipp, A.; Schmidt-Parzefall, W.; Schroeder, H.; Schulz, H.D.; Selonke, F. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Dec 1984. 16p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751629.

Using the ARGUS detector at DORIS, we have observed the production of Fsup(+-) mesons in e^+e^- annihilation at a centre of mass energy of 10 GeV through their subsequent decays into PHIπsup(+-) and PHI$\pi^+\pi^-\pi$sup(+-). The values obtained for [R(e^+e^- -> F x). Branching Ratio] are (1.47 +- 0.32 +- 0.20)% and (1.63 +- 0.42 +- 0.41)% respectively. The observed mass is (1973.6 +- 2.6 +- 3.0) MeV/c^2. The F momentum spectrum is as expected for the fragmentation of c quarks into charmed mesons, but is somewhat softer than for fragmentation into Dsup(*) mesons. The relevant angular distributions are consistent with a spin zero assignment of the F meson.

32555 **(DESY—84-104) Heavy quark fragmentation.** Izen, J.M. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Oct 1984. Contract AC02-76ER00881. 36p. (CONF-8406183—10; WISC-ex—84-244). NTIS (US Sales Only), PC A03/MF A01. File Number DE85750987.

From 15. international symposium on multiparticle dynamics; Lund, Sweden (11 Jun 1984).

Recent developments in the field of charm and bottom quark fragmentation are reviewed. Results derived from direct charm meson reconstruction and from inclusive lepton analyses are shown. Two experimentally related topics, semileptonic branching ratios and the weak asymmetry of heavy quarks are also discussed.

32556 (DESY—84-121) Tests of the standard model with lepton pair production in e^+e^- reactions. Berger, C.; Deuter, A.; Genzel, H.; Lackas, W.; Pielorz, J.; Raupach, F.; Wagner, W.; Klovning, A.; Lillestoel, E.; Bussey, P.J. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Dec 1984. 24p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751628.

The differential cross section of the reaction e^+e^- -> e^+e^- at a c.m. energy of 34.7 GeV has been measured. The result, together with our previously measured e^+e^- -> $\mu^+\mu^-$ data, are compared with the standard model predictions. We obtain for the weak neutral current couplings the values gsub(v)^2=0.09 +- 0.06, gsub(a)^2=0.38 +- 0.08. A fit of the Weinberg mixing angle gives the value sin^{2}deltasub(w)=0.13 sup(+0.03)sub(-0.02)(1 sigma) sup(+0.08)sub(-0.03)(2 sigma). The data are also used to set limits on possible deviations from the pointlike structure of leptons. An upper limit for the e^+e^- coupling to a heavy spin 0 boson is also given.

32557 (DESY—85-001) Search for spinless bosons in e^+e^- annihilation. Althoff, M.; Braunschweig, W.; Kirschfink, F.J.; Martyn, H.U.; Rosskamp, R.; Schmitz, D.; Siebke, H.; Wallraff, W.; Eisenmann, J.; Fischer, H.M. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Jan 1985. 16p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751634.

We have measured the cross sections for e^+e^- -> e^+e^-, e^+e^- -> $\mu^+\mu^-$, e^+e^- -> $\gamma\gamma$ and e^+e^- -> hadrons in an energy scan at center of mass energies between 39.79 and 46.72 GeV in 30 MeV steps. New spinless bosons, whose existence has been postulated as a possible means to explain the anomalously large radiative width of the Z^0 found at the CERN SPS panti p collider, are ruled out in the scan region. The data are used to set limits on the couplings to lepton, photon and quark pairs of bosons with masses above 46.72 GeV.

32558 (DOE/ER/01195—498) Production of omega and phi mesons by 193 GeV/C pions and 250 GeV/C protons on a beryllium target. Bellinger, J.N. (Illinois Univ., Urbana (USA). Dept. of Physics). 1985. Contract AC02-76ER01195. 158p. (COO—1195-498). NTIS, PC A08/MF A01; 1; GPO Dep. File Number DE85011217.

Omegas and phis were observed in di-muon events. Differential cross sections with respect to perpendicular momentum and Feynman-X for both meson types and both beam types are compared. When a simple parton fusion model is used to describe the Feynman-X distributions the omega appears to be produced predominantly by gluon fusion. 73 refs.

32559 (DOE/ER/40105—T2) Radiative decay of the K^{*-}(890). Berg, D.; Chandlee, C.; Cihangir, S.; Ferbel, T.; Huston, J.; Jensen, T.; Lobkowicz, F.; Nelson, C.A. Jr.; Ohshima, T.; Slattery, P. (Rochester Univ., NY (USA). Dept. of Physics and Astronomy; Fermi National Accelerator Lab., Batavia, IL (USA); Minnesota Univ., Minneapolis (USA)). [1985]. Contract AC02-83ER40105. 11p. (COO—1764-390). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011547.

We report a measurement of the radiative decay of the K^{*-}(890). The width for the transition $K^{*-} \rightarrow K^-\gamma$ is 62 $^{+-}$ 14 keV. The resulting ratio of decay probabilities ($K^{*0} \rightarrow K^0\gamma$)/($K^{*-} \rightarrow K^-\gamma$), while consistent with predictions of certain quark models, does not agree with expectations from unbroken SU(3) symmetry. 9 refs.

32560 (IFVE-OEF—83-203) Investigation of D(1285) and E(1420) meson production in exclusive interactions of negatively charged pions and kaons at the momentum 32,5 GeV/c. Bityukov, S.I.; Viktorov, V.A.; Golovkin, S.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1983. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701011.

Submitted to the journal Nucl. Phys.

Mixing angle in the axial meson nonet 6 delta 6 < 13 deg (delta=0 corresponds to the ideal mixing), so e(1420) consists of strange quarks mainly. a signal from the e(1420) meson has been observed in the reaction [k]p → k[k] πy. a large value for the ratio σ[k]p → e(1420)y]/σ[π]p → e(1420y] that is greater than 10, confirms the conclusion on the e meson quark contents.

32561 (IFVE-OEIPK—83-108) Neutral strange particle production in K^+p interactions at 32 GeV/c. Azhinenko, I.V.; Vorob'ev, A.P.; Garuchava, Z.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1983. 59p. (In Russian). NTIS (US Sales Only), PC A04/MF A01. File Number DE85701012.

Submitted to the journal Sov. J. Nucl. Phys. .

The production properties of Ksub(s)sup(0), antiΛ and Λ production in K^+p interactions at 32 GeV/c are investigated using the final statistics of 10^6 events. Data on total and semi-inclusive cross sections and average multiplicities are presented. Estimates are given of the diffractive dissociation contributions to Ksub(s)suop(0), antiΛ and Λ total and differential cross sections. The x, Psub(T), x is Feynman variable, Psub(T) is transverse momentum and transverse mass dependence of inclusive and semi-inclusive distributions is discUssed as well as properties of "prompt" Ksub(s)sup(0) s. The ratio of K_{890}^{*+} (K_{890}^{*0}) to prompt K^0 cross sections is measured to be 1.03+-0.12 (0.98+-0.17). From a comparison of antiΛ cross sections in $K^{+-}p$ collisions at 32 GeV/c, the strange sea (anti ss) production probability is established, relative to (anti uu) or (anti dd) creation to be 0.26+-0.02. The double differential cross section of Ksub(s)sup(0) is studied as a function of x and Psub(T)sup(2) and a triple-Regge fit performed. Main results of the checked detailed analysis of the Ksub(s)sup(0), antiΛ and Λ prodUction processes in the K^+p-interactions at 32 GeV/c may be formulated as follows: the Ksub(s)sup(0) and Λ total inclusive cross sections in the primary momentum range of 16 to 147 GeV/c and those of antiΛ at 16 to 70 GeV/c increase with energy according to a logarithmic law. Average multiplicities of Ksub(s)sup(0), antiΛ and Λ in the events with fixed multiplicities of n charged particles linearly decrease with the n growth. The Ksub(s)sup(0), antiΛ and Λ production cross sections in diffraction processes are small compared with the total inclusive cross sections and make up σ(Ksub(D)sup(+) → Ksub(s)sup(0)X)=180+-30 μb, σ(Ksup(D)sup(+) → antiΛX)=12+-6 μb and σ(Psub(D) → ΛX)=9+-4 μb. Most of the results are compared in detail to the Lund model for low-Psub(T) hadron-hadron collisions.

32563 (INIS-mf—9299, pp 121-123) Deep inelastic scattering of charged leptons and quark distributions in nuclei. Rith, K. (Freiburg Univ. (Germany, F.R.). Fakultaet fuer Physik). 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780947. (CONF-840166—).

From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

One class of experiments is a detailed investigation of the A and Q^2 dependence of the effect by studying F_2sup(N) for a variety of nuclei. A scan of the A dependence has already been performed at SLAC, where the cross section per nucleon for D, He, Be, C, Al, Ca, Fe, Ag, and Au were measured in the kinematic range

$0.09<=x<=0.9$ and $2<=Q^2<=15$ $(GeV/c)^2$, using electrons with energies ranging from 8 to 24.5 GeV. (orig./HSI).

32564 (JINR—R-6-84-149) Measurement of the neutrino helicity in the decay of sup(152m)Eu with Ge(II) detector. Vylov, Ts.; Brudanin, V.B.; Gorozhankin, V.M. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1984. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701010.

The new experiment on the determination of the neutrino helicity from the decay of sup(152 m)Eu by the measurement of the 963.4 keV gamma-ray circular polarization (Hsub(γ)) was performed. The theoretical estimate of Hsub(γ) taking into accout not only the intrinsic level width and K-capture but also the thermal motion and the capture in a hiqher shells is - 0.93, which obiously disagrees with the results of previous experiments. The new measurement of Hsub(γ) with a 100 cm^3 Ge(Li) detector has given the value-0.87+-0.10, which is in good agreement with both the abovementioned estimate and the assumption of the neutrino helicity to be Hsub(ν)=-1.

32565 (SLAC-PUB—3683) Status of the zeta(8.3). Lowe, S.T. (Stanford Linear Accelerator Center, CA (USA)). May 1985. Contract AC03-76SF00515. 5p. (CONF-850375—2). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013070.

From 20. Rencontre de Moriond; Les Arcs, France (10 Mar 1985).

Results are presented from 22.1 pb^{-1} of Y(1S) data, taken with the Crystal Ball detector at DORIS. These data were taken to further explore the zeta(8.3) signal originally seen in 10.4 pb^{-1} of Y(1S) data. No evidence for the zeta is observed in this new sample. Data quality checks and possible explanations are discussed.

32566 (UR—824) Radiative width of the K^{*+}(1430) and radiative width of the A_2(1310). Cihangir, S.; Berg, D.; Biel, J.; Chandlee, C.; Collick, B.; Droege, T.; Ferbel, T.; Heppelmann, S.; Huston, J.; Jensen, T. (Rochester Univ., NY (USA). Dept. of Physics and Astronomy). 1981. Contract AC02-83ER40105. 21p. (COO—3065-332; COO—1764-441). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012394.

Using the Primakoff formalism, we have extracted the radiative decay width of the K^{*+}(1430) produced in coherent interactions of 200 GeV/c K^+ mesons in nuclear targets and the radiative decay width of the A_2^+(1310) produced in coherent interactions of 200 GeV/c π^+ mesons in nuclear targets. The widths obtained are 240 +- 45 keV and 295 +- 60 keV, respectively, values reasonably consistent with quark-model predictions.

32567 Charged-hyperon production by 400-GeV protons. Cardello, T.R.; Cooper, P.S.; Teig, L.J.; Thron, J.L.; Wah, Y.; Ankenbrandt, C.; Berge, J.P.; Brenner, A.E.; Butler, J.; Doroba, K. (Yale University, New Haven, Connecticut 06520). *Physical Review* [*Section*] *D: Particles and Fields;* **32**: No. 1, 1-10(1 Jul 1985).

Differential production cross sections have been measured for Σ^-, Ξ^-, Ω^-, Σ^+, Sigma-bar$^+$, and Xi-bar$^+$ relative to pion production at several x/sub F/ and P/sub T/ with 0.24<eqx/sub F/<eq0.90 and P/sub T/<eq2 GeV using 400-GeV protons incident on a Cu target. The data can be described by the function A(1-x/sub F/)/sup n/eT, where A and n depend only on the hyperon type, and B is quadratic in x/sub F/, and also depends on hyperon type. Comparison with previous experiments supports scaling in x/sub F/ over the range 200—400 GeV/c.

32568 Measurement of the electron asymmetry in the beta decay of polarized Σp hyperons. Hsueh, S.Y.; Muller, D.; Tang, J.; Winston, R.; Zapalac, G.; Swallow, E.C.; Berge, J.P.; Brenner, A.E.; Grafstrom, P.; Jastrzembski, E. (Enrico Fermi Institute, University of Chicago, Chicago, Illinois 60637). *Physical Review Letters;* **54**: No. 22, 2399-2402(3 Jun 1985). Contract AC02-80ER10587;AC02-76ER03075;AC02-76CH03000.

We report the results of a Fermilab Tevatron experiment using a Σ^- beam with a measured polarization of 0.22 +- 0.04. We find the electron asymmetry in Σ^- beta decay to be α/sub e/ = -0.53 +- 0.14 on the basis of a sample of 25 000 events, in agreement with the Cabibbo model and in contradiction with previous experiments. The corresponding value for the ratio of axial vector to vector form factors is g_1/f_1 = -0.29 +- 0.07. .AE

32569 Measurement of K(and K^0 inclusive rates in e^+e^- annihilation at 29 GeV. Schellman, H.; Trilling, G.H.; Abrams, G.S.; Amidei, D.; Baden, A.R.; Boyer, J.; Butler, F.; Dillon, J.B.; Gidal, G.; Gold, M.S.; Goldhaber, G.; Golding, L.J.; Haggerty, J.; Herrup, D.; Juricic, I.; Kadyk, J.A.; Nelson, M.E.; Rowson, P.C.; Schmidke, W.B.; Sheldon, P.D.; de la Vaissiere, C.; Wood, D.R.; Barklow, T.; Boyarski, A.M.; Breidenbach, M.; Burchat, P.R.; Burke, D.L.; Dorfan, J.M.; Feldman, G.J.; Gladney, L.; Hanson, G.; Hayes, K.; Himel, T.; Hollebeek, R.J.; Innes, W.R.; Jaros, J.A.; Karlen, D.; Lankford, A.J.; Larsen, R.R.; LeClaire, B.W.; Lockyer, N.S.; Lueth, V.; Matteuzzi, C.; Ong, R.A.; Perl, M.L.; Richter, B.; Riles, K.; Ross, M.C.; Schlatter, D.; Yelton, J.M.; Zaiser, C.; Levi, M.E.; Schaad, T. (Lawrence Berkeley Laboratory and Department of Physics, University of California, Berkeley, California 94720). *Physical Review* [*Section*] *D: Particles and Fields;* **31**: No. 11, 3013-3016(1 Jun 1985).

We have measured the K^0+K ^{0} inclusive cross section in e^+e^- annihilation at 29 GeV with the Mark II detector SLAC PEP. We find 1.27 +- 0.03 +- 0.15 K^0+K ^{0} per hadronic event. We have also used time-of-flight particle identification to measure the K^{+-} rate over the momentum range 300—900 MeV/c.

32570 Prompt muon production in e^+e^- annihilations at 29 GeV. Aihara, H.; Alston-Garnjost, M.; Badtke, D.H.; Bakken, J.A.; Barbaro-Galtieri, A.; Barnes, A.V.; Barnett, B.A.; Bengtsson, H.; Blumenfeld, B.J.; Bross, A.D. (Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720 University of California, Los Angeles, California 90024 University of California, Riverside, California 92521 Johns Hopkins University,). *Physical Review* [*Section*] *D: Particles and Fields;* **31**: No. 11, 2719-2723(1 Jun 1985).

We have studied the production of prompt muons in hadronic events from e^+e^- annihilation at a center-of-mass energy of 29 GeV with the PEP4-TPC (Time Projection Chamber) detector. The muon p and p/sub t/ distributions are well described by a combination of bottom- and charm-quark decays, with fitted semimuonic branching fractions of (15.2 +- 1.9 +- 1.2)% and (6.9 +- 1.1 +- 1.1)%, respectively. The muon spectra imply hard fragmentation functions for both b and c quarks, with <z(b quark)> = 0.80 +- 0.05 +- 0.05 and <z(c quark)> = 0.60 +- 0.06 +- 0.04. We derive neutral-current axial-vector couplings of a(b quark) = -0.9 +- 1.1 +- 0.3 and a(c quark) = 1.5 +- 1.5 +- 0.5 from the forward-backward asymmetries.

32571 Measurement of energy-energy correlations in $e^+e^-\rightarrow$hadrons at $\sqrt{s}$ = 29 GeV. Fernandez, E.; Ford, W.T.; Qi, N.; Read A.L. Jr.; Smith, J.G.; Camporesi, T.; De Sangro, R.; Marini, A.; Peruzzi, I.; Piccolo, M.; Ronga, F.; Blume, H.T.; Hurst, R.B.; Sleeman, J.C.; Venuti, J.P.; Wald, H.B.; Weinstein, R.; Band, H.R.; Gettner, M.W.; Goderre, G.P.; Meyer, O.A.; Moromisato, J.H.; Shambroom, W.D.; von Goeler, E.; Ash, W.W.; Chadwick, G.B.; Clearwater, S.H.; Coombes, R.W.; Kaye, H.S.; Lau, K.H.; Leedy, R.E.; Lynch, H.L.; Messner, R.L.; Moss, L.J.; Muller, F.; Nelson, H.N.; Ritson, D.M.; Rosenberg, L.J.; Wiser, D.E.; Zdarko, R.W.; Groom, D.E.; Lee, H.; Delfino, M.C.; Heltsley, B.K.; Johnson, J.R.; Lavine, T.L.; Maruyama, T.; Prepost, R. (Department of Physics, University of Colorado, Boulder, Colorado 80309). *Physical Review* [*Section*] *D: Particles and Fields;* **31**: No. 11, 2724-2731(1 Jun 1985).

The energy-energy correlation cross section for hadrons produced in electron-positron annihilation at a center-of-mass energy of 29 GeV has been measured with the MAC detector at SLAC. The result is corrected for the effects of detector resolution, acceptance, and initial-state radiation. The correlation is measured in two independent ways on the same data sample: the energy weights and angles are obtained either from the energy flow in the finely segmented total absorption calorimeters or from the momenta of charged tracks in the central drift chamber. This procedure helps reduce systematic errors by cross-checking the effects of the detector on the measurement, particularly important because the corrections depend on complex Monte Carlo simulations. The results are compared with the predictions of Monte Carlo models of complete second-order perturbative quantum chromodynamics and fragmentation, with the following conclusions: (1) fitting the asymmetry for large correlation angles gives values for α/sub S/ of 0.120 +- 0.006 in perturbation theory, 0.185 +- 0.013 in the Lund string model, and values which vary from 0.105 to 0.140 (+- 0.01) in the incoherent jet models, depending on the gluon fragmentation scheme and the algorithm used for momentum conservation; and (2) the string fragmentation model provides a satisfactory description of the measured energy-energy correlation cross section, whereas incoherent jet formation does not.

32572 New limit on the strength of mixing between ν/sub μ/ and ν/sub e/. Ahrens, L.A.; Aronson, S.H.; Connolly, P.L.; Gibbard, B.G.; Murtagh, M.J.; Murtagh, S.; Terada, S.; White, D.H.; Callas, J.L.; Cutts, D.; Hoftun, J.S.; Lanou, R.E.; Shinkawa, T.; Amako, K.; Kabe, S.; Nagashima, Y.; Suzuki, Y.; Tatsumi, S.; Abe, K.; Beier, E.W.; Doughty, D.C.; Durkin, L.S.; Heagy, S.M.; Hurley, M.; Mann, A.K.; Newcomer, F.M.; Williams, H.H.; York, T.; Hedin, D.; Marx, M.D.; Stern, E. (Physics Department, Brookhaven National Laboratory, Upton, New York 11973). *Physical Review [Section] D: Particles and Fields;* **31**: No. 11, 2732-2736(1 Jun 1985).

Measurements have been made of the reactions ν/sub e/ $n \rightarrow e^- p$ and ν/sub μ/$n \rightarrow \mu^- p$ in a detector located an effective distance of 96 m from a neutrino source. These measurements yield directly the energy-dependent ratio of the neutrino fluxes [Phi(E(ν/sub e/))/Phi(E(ν/sub μ/))]/sub obs/ incident on the detector. When combined with an estimate of the flux ratio emanating from the source [Phi(E(ν/sub e/))/Phi(E(ν/sub μ/))]/sub calc/, the measured ratio provides an upper limit on the strength of mixing between ν/sub μ/ and ν/sub e/. We obtain $\sin^2 2\alpha < 3.4 \times 10^{-3}$ (90% C.L.) in the limit of large mass difference Δm^2 (equivalent'$m_1{}^2$-$m_2{}^2$') between neutrino mass eigenstates, m_1 and m_2; and an upper limit on the product $\Delta m^2 \sin 2\alpha < 0.43$ eV^2 in the limit of small mass difference.

32573 Experimental consequences of family unification. Bagger, J.; Dimopoulos, S.; Masso, E.; Reno, M.H. (Lyman Laboratory of Physics, Harvard University, Cambridge, Massachusetts 02138 and Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305). *Physical Review Letters;* **54**: No. 20, 2199-2202(20 May 1985). Contract AC03-76SF00515.

Theories of family unification predict four left-handed and four right-handed families of quarks and leptons, all with masses below 265 GeV. The lightest mirror quark has a mass of less than 140 GeV. All charged leptons are lighter than 55 GeV, and the lightest is below 40 GeV. All five new neutrinos have masses less than 40 GeV and contribute to the width of the Z^0. We study the decays of these new families, and discuss rare processes such as $\mu \rightarrow e\gamma$. We also examine proton decay, and show that it can proceed into $e^+ \pi^0$ at the observable but acceptable rate of 10/sup 32plus-or-minus1/ yr.

32574 Electroweak effects in $e^+ e^- \rightarrow$tau$^+$ tau$^-$ at 29 GeV. Fernandez, E.; Ford, W.T.; Qi, N.; Read A.L. Jr.; Smith, J.G.; Camporesi, T.; De Sangro, R.; Marini, A.; Peruzzi, I.; Piccolo, M.; Ronga, F.; Blume, H.T.; Hurst, R.B.; Venuti, J.P.; Wald, H.B.; Weinstein, R.; Band, H.R.; Gettner, M.W.; Goderre, G.P.; Meyer, O.A.; Moromisato, J.H.; Shambroom, W.D.; Sleeman, J.C.; von Goeler, E.; Ash, W.W.; Chadwick, G.B.; Clearwater, S.H.; Coombes, R.W.; Kaye, H.S.; Lau, K.H.; Leedy, R.E.; Lynch, H.L.; Messner, R.L.; Moss, L.J.; Muller, F.; Nelson, H.N.; Ritson, D.M.; Rosenberg, L.J.; Wiser, D.E.; Zdarko, R.W.; Groom, D.E.; Lee, H.; Delfino, M.C.; Heltsley, B.K.; Johnson, J.R.; Lavine, T.L.; Maruyama, T.; Prepost, R. (University of Colorado, Boulder, Colorado 80309). *Physical Review Letters;* **54**: No. 15, 1620-1623(15 Apr 1985). Contract AC02-81ER40025;AC03-76SF00515;AC02-76ER00881.

A high-statistics measurement is presented of the cross section for the process $e^+ e^- \rightarrow$tau$^+$ tau$^-$ at $\sqrt{s} = 29$ GeV from the MAC detector at PEP. A fit to the angular distribution of our sample of 10 153 events with '$\cos\theta$'<0.9 gives an asymmetry A/sub tautau/ = -0.055 +- 0.012 +- 0.005 from which we find the product of electron and tau axial-vector weak neutral couplings g/sub A//sup e/G/sub A//sup tau/ = 0.22 +- 0.05.

32575 Recent results in upsilon spectroscopy from CESR. Schamberger, R.D. Jr. (State Univ. of New York, Stony Brook). *AIP (American Institute of Physics) Conference Proceedings;* No. 98, 381-401(1983). (CONF-8210113—).

From American Physical Society meeting on particles and fields; College Park, MD, USA (28 Oct 1982).

In this report, results in upsilon spectroscopy from CESR are given. Primary emphasis in the past year in the area of spectroscopy has centered on the decay modes of the upsilon' (3^3S). Hadronic transitions to both lower laying S states have been measured. Photon transitions to the 2^3P states have been observed in both inclusive and exclusive channels. Branching ratios and parameters of the 2^3P states will be presented. Limits on other states in the upsilon system, accessible thru $e^+ e^-$ annihilations, and results on an axion search are also reported.

32576 (BONN-HE—84-35) Survey of two-photon physics: What have we done, where are we going. Kolanoski, H. (Bonn Univ. (Germany, F.R.). Physikalisches Inst.). Nov 1984. 26p. (CONF-8409194—5). NTIS (US Sales Only), PC A03/MF A01. File Number DE85751626.

From 6. international workshop on photon-photon collisions; Lake Tahoe, CA, USA (9 Sep 1984).

After a brief general introduction into two-photon scattering processes the status of two-photon physics as of the beginning of this workshop is reported. Emphasis is given to those subjects which should get more attention in the future.

32577 (CBPF-NF—006/83) pp production cross sections and the constraint method. Anjos, J.C.; Santoro, A.F.S.; Souza, M.H.G.; Predazzi, E. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 16p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701441.

A method of constructing production cross sections that satisfy the constraints represented by the first few moments is shown to give an excellent account of the data when applied to the high energy pp production cross section ν sub(n) (s) plotted as functions of n.

32578 (CBPF-NF—008/83) Problems in accounting for the soft and hard components in transverse energy triggers. Anjos, J.C.; Santoro, A.F.S.; Souza, M.H.G.; Escobar, C.O. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 11p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701444.

It is argued that for a transverse energy trigger, the cancellation theorem of DeTar, Ellis and Landshoff is not valid. As a consequence, the problem of accounting for soft and hard components in this kind of trigger becomes complicated and no simple separation between them is expected.

32579 (CBPF-NF—024/83) **Twelve colourful stones.** Doria, R.M. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 36p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701445.

A dynamics with twelve colourful stones is created based on the concepts of gauge and colour. It is associated different gauge fields to the same group. A group of gauge invariant Lagrangians is established. A gauge invariant mass term is introduced. The colourful stones physical insight is building blocks for quarks and leptons.

32580 (CERN—84-10, pp 303-318) **Total cross section and diffractive processes at the large hadron collider (LHC).** Haguenauer, M.; Matthiae, G. (European Organization for Nuclear Research, Geneva (Switzerland)). 5 Sep 1984. NTIS (US Sales Only), PC A16/MF A01. File Number DE85701073. (CONF-8403162—Vol.1; ECFA—84/85).

From ECFA/CERN workshop on the possibility of a large hadron collider in the LEP tunnel; Lausanne, Switzerland (22 Mar 1984).

We first review the theoretical expectations on the total cross section, elastic scattering and diffraction dissociation in the multi-TeV energy range and then discuss the feasibility of the experiments at the Large Hadron Collider (LHC).

32581 (CERN—84-10, pp 319-322) **Production of masses in the forward cone: 'The angle of archeology'.** Ekeloef, T. (Uppsala Univ. (Sweden)). 5 Sep 1984. NTIS (US Sales Only), PC A16/MF A01. File Number DE85701073. (CONF-8403162—Vol.1; ECFA—84/85).

From ECFA/CERN workshop on the possibility of a large hadron collider in the LEP tunnel; Lausanne, Switzerland (22 Mar 1984).

Our conclusion of this study is that for the observation of masses below 1 TeV/c^2 that are produced through parton-parton fusion and decay into a pair of leptons or jets at a 9 + 9 TeV hadron collider, one should look in the forward-backward direction at polar angles below 40°. At the Fermilab collider of 1 + 1 TeV it will only be possible to explore the lower part of this mass region at low cross-section. At a 9 + 9 TeV collider, on the other hand, the cross-section over this whole mass region is considerable and the physics there would be open for detailed study provided that the forward-backward regions would be equipped with high quality detectors.

32582 (CERN—84-10, pp 323-326) **Theoretical predictions for pp and p anti p elastic scattering in the TeV energy domain.** Bourrely, C.; Martin, A. (European Organization for Nuclear Research, Geneva (Switzerland)). 5 Sep 1984. NTIS (US Sales Only), PC A16/MF A01. File Number DE85701073. (CONF-8403162—Vol.1; ECFA—84/85).

From ECFA/CERN workshop on the possibility of a large hadron collider in the LEP tunnel; Lausanne, Switzerland (22 Mar 1984).

We present theoretical predictions on total cross-sections and elastic scattering in the TeV energy domain obtained from the present experimental situation at the ISR and the panti p Collider.

Werner-Heisenberg-Inst. fuer Physik). 5 Sep 1984. NTIS (US Sales Only), PC A16/MF A01. File Number DE85701073. (CONF-8403162—Vol.1; ECFA—84/85).

From ECFA/CERN workshop on the possibility of a large hadron collider in the LEP tunnel; Lausanne, Switzerland (22 Mar 1984).

With 51 refs. .

In this report I discuss some of the reasons which point towards this 'nearby compositeness', and examine some of the physical phenomena that are connected with substructure which could be explored at a Supercollider.

32584 (CERN—84-10, pp 354-358) **Lepton- and quark substructure at a multi-TeV-collider.** Fritzsch, H. (Muenchen Univ. (Germany, F.R.). Sektion Physik; Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.). Werner-Heisenberg-Inst. fuer Physik). 5 Sep 1984. NTIS (US Sales Only), PC A16/MF A01. File Number DE85701073. (CONF-8403162—Vol.1; ECFA—84/85).

From ECFA/CERN workshop on the possibility of a large hadron collider in the LEP tunnel; Lausanne, Switzerland (22 Mar 1984).

There is no doubt that a hadron collider with $\sqrt{s}$ approx.= 20 TeV will be an extremely useful machine in studying the substructure of leptons, quarks and weak bosons. If Λsub(h) is of the order of 1 TeV or less, the chances are good to observe substructure effects at the CERN or FNAL colliders or at HERA. However details of an underlying substructure (e.g. the spectrums of excited quarks or leptons) can only be learned with a machine such as the one studied here in which the energies of the hard collisions of the quarks, gluons and/or leptons exceed 1 TeV.

32585 (CNRS-CPT—84-P-1608) **Electromagnetic mass differences between baryons in potential models.** Richard, J.M.; Taxil, P. (Centre National de la Recherche Scientifique, 13 - Marseille (France). Centre de Physique Theorique; Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). Apr 1984. 14p. (IPNO-TH—84-32). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751291.

We calculate explicitely the electromagnetic mass splittings induced within the ground state baryons by the mass difference between the u and d quarks. This is performed in the framework of the non-relativistic potential model with an accurate treatment of the three-body problem. We also discuss the charge radius of the neutron.

32586 (DEMO—83/9) **Comparison of structure function data to the Lopez-Yndurain parametrizations.** Dris, M.; Karpathopoulos, S. (Democritos Nuclear Research Center, Athens (Greece)). Jun 1983. 22p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701447.

We report on some results we get from fits of the Lopez-Yndurain parametrizations for structure functions to old CDHS and EMC data. These parametrizations are compatible with QCD, to leading order, at the end points and the relevant sum rules are properly imposed.

32587 (DESY—85-003) **Monopole-fermion and dyon-fermion bound states. Pt. 3.** Osland, P.; Tai Tsun Wu. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Jan 1985. Contract FG02-84ER40158. 31p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85751632.

In the first part of the paper, we give analytic, approximate results for the Kazama-Yang monopole-fermion binding energies and wave functions, valid for large values of A = 1/2 Zvertical strokeegvertical strokeK, where K is the extra magnetic moment. In the second part, more general results are obtained for the same problem that are valid when either A is large or the binding is weak. Numerical results for the binding energy are tabulated and compared.

32588 (DESY—85-004) **Monopole-fermion and dyon-fermion bound states. Pt. 4.** Osland, P.; Tai Tsun Wu. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Jan 1985. Contract FG02-84ER40158. 49p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85751631.

In the first part of the paper, we give analytic, approximate results for dyon-fermion binding energies and wave functions, valid for large values of A = 1/2 Zvertical strokeegvertical strokeK, where K is the magnetic moment. In the second part, more general results are obtained for the same problem that are valid when either A is large or the binding is weak. Numerical results for the binding energy are tabulated and compared. The case of very strong binding is also discussed.

32589 **(DESY—85-005) Correlations and static energies in the standard Higgs-model.** Montvay, I. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Jan 1985. 50p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85751630.

Correlations in the W-boson and Higgs-boson channels and the static energy of an external SU(2)-doublet charge pair are investigated by Monte Carlo calculations in the SU(2) lattice gauge theory with a Higgs-scalar doublet. The mass ratio msub(W)/msub(H) and the shape of the static potential are used to obtain information on the renormalization group trajectories in the three-dimensional coupling constant space. Numerical evidence shows that only two of the couplings are relevant. The phase transition line on the border of the Higgs-phase is weakly first order. A lower bound msub(H)/msub(W) >= 1.0 +- 0.3 is obtained for the ratio of the Higgs-boson mass to the W-boson mass.

32590 **(DOE/ER/40105—462) Duality of two-point functions for confined non-relativistic quark-antiquark systems.** Fishbane, P.M.; Gasiorowicz, S.G.; Kaus, P. (Virginia Univ., Charlottesville (USA). Dept. of Physics; Minnesota Univ., Minneapolis (USA). Dept. of Physics; California Univ., Riverside (USA). Dept. of Physics). [1985]. Contract AC02-83ER40105. 28p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012334.

An analog to the scattering matrix describes the spectrum and high-energy behavior of confined systems. We show that for non-relativistic systems this S-matrix is identical to a two-point function which transparently describes the bound states for all angular momenta. Confined systems can thus be described in a dual fashion. This result makes it possible to study the modification of linear trajectories (originating in a long-range confining potential) due to short range forces which are unknown except for the way in which they modify the asymptotic behavior of the two point function. A type of effective range expansion is one way to calculate the energy shifts. 9 refs.

32591 **(DOE/ER/40105—T3) Relativistic wavefunction at the origin and the pion decay constant.** Haqq, E.; Suura, H. (Massachusetts Univ., Amherst (USA). Dept. of Physics and Astronomy; Minnesota Univ., Minneapolis (USA). School of Physics and Astronomy). [1985]. Contract AC02-83ER40105. 13p. (COO—1764-408). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012392.

A hybrid Breit-Salpeter equation is studied for the pion. It is shown that the component of the Salpeter amplitude related to f/sub π/ is finite at the origin if the full relativistic equation is solved. This leads to an unambiguous calculation of f/sub π/. It is shown that this finiteness of the wavefunction is due to a suppression of the Coulomb potential whereby the 1/r singularity at the origin is reduced to a logarithmic one.

32592 **(DOE/ER/70004—T3) Should we expect large polarization effects at high energies.** Goldstein, G.R.; Moravcsik, M.J. (Tufts Univ., Medford, MA (USA). Dept. of Physics; Oregon Univ., Eugene (USA)). 1984. Contract AT06-76ER70004. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011499.

It is demonstrated that while in reactions at very high energies polarization quantities in which the polarization of only one particle is specified are likely to be small, due to dynamics-independent factors, for many of the kinematic configurations of interest, this is in no way indicative of other polarization quantities many of which could very well be very far from the trivial values of 0 or 1.

32593 **(EFI—675(65)-83) THETA-resonance photoproduction.** Shakhnazaryan, Yu.G. (Erevanskij Fizicheskij Inst. (USSR)). 1983. 14p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701005.

Assuming that the recently observed at PETRA and SPEAR THETA(1650)- and THETA′(2100)-states are resonances in the rho^0 rho^0 system, possibility of their study in the photoproduction process γP→THETA(THETA′)p are discussed. The partial widths of decays THETA→rho^0 rho^0, $rho^0 \gamma$, $\gamma\gamma$ as well an the differential cross section $d\sigma/dt$ in pole approximation with rho^0-meson exchange are calculated for the case when the quantum numbers of these resonances are Jsup(PC)=Osp(++). The dependence of differential cross section on the production angle V in c.m.s. at some values of γ-quantum energy starting with the production threshold up to 10 GeV in lab as well as the dependence of the integral cross section on γ-quantum energy in the same energy region are plotted. The case when spin-parity of these resoances are Jsup(P)=2sup(+) is also discussed. The transitionvertex describing THETA→$rho^0\gamma$ decay has in this case three unknown coupling constants.

32594 **(IFT-P—01/84) Relativistic quark model.** Ferreira, P.L. (Instituto de Fisica Teorica, Sao Paulo (Brazil)). 1984. 17p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701009.

A relativistic independent quark model whose single quark states obey a Dirac equation with an equal mixture of vector and scalar linear confining potential is discussed with particular emphasis in higher orbital excitations.

32595 **(IFVE-OTF-OEF—83-148) G(1590)-meson and possible characteristic features of a glueball.** Gershtejn, S.S.; Likhoded, A.K.; Prakoshkin, Yu.D. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1983. 10p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85700663.

Submitted to the journal Z. Phys., C.

The scalar meson G(1590) is considered as a possible glueball. The decay mechanism, characteristic of a glueball, is proposed (the discolouring of gluons by gluons) which allows one to understand the increase of G → etaeta decay rate, as compared to the decays of G → $\pi\pi$ and G → K anti K, observed in the experiment. It is proposed to measure the ratio of branching ratios R=BR(G → etaeta′)/BR(G → etaeta) which is sensitive to the gluon content of G(1590). In the one-pion exchange model the predicted R values are within the range: 2 < or approximately R < or approximately 3.7.

32596 **(INIS-BR—252) Pion photoproduction in nucleons at low energies.** Carvalho, F.A.B.R. de. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). 1983. 97p. (In Portuguese). NTIS (US Sales Only), PC A05/MF A01. File Number DE85701440.

A new semiphenomenological analysis of the multipoles for pion photoproduction from nucleons, in the region of the first π-N resonance is presented. Through an energy dependent model, multipoles with isospin 1/2 and 3/2 and total angular momentum J < = 3/2 are determined.

32597 **(INIS-mf—9299, pp 84-87) Hadronic thermodynamics: Is there a limiting temperature.** Olive, K.E. (Fermi National Accelerator Lab., Batavia, IL (USA). Astrophysics Theory Group). 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780947. (CONF-840166—).

From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

The hadron mass spectrum continues to be a topic of theoretical interest and will remain so until there can be some experimental verification in future heavy ion collisions. There are a variety of models such as the bootstrap, dual, bag etc., which all predict an exponentially rising density of states approx.= $\exp(m/T_0)$, T_0approx.=160 MeV. Once one assumes an exponential mass spectrum, one generally finds singularities in thermodynamic quantities and hence possibly a limiting temperature at T_0. In this talk, I point out some possible ways out of this dilemma. (orig./HSI).

32598 **(INIS-mf—9299, pp 125-128) Chiral symmetry breaking and the pion.** Brockmann, R. (Regensburg Univ. (Germany, F.R.). Inst. fuer Physik 1 - Theoretische Physik). 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780947. (CONF-840166—).

From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

The relation between qanti q structure and the Goldstone Boson nature of the pion is analysed in a chiral effective Hamiltonian model. The physical pion mass is obtained with small but finite current quark masses msub(u)+msub(d)approx.=30 MeV in a way consistent with current algebra and QCD sumrules. The pion wave function is obtained as a superposition of qanti q pairs with a strong admixture of many-quark-many-antiquark components. The pion decay constants is calculated and found to be compatible with the experimental value for a qanti q valence rms radius of 0.4 fm. (orig.).

32599 (INIS-mf—9299, pp 171-173) **Nucleon-antinucleon interaction and the quark model.** Furui, S.; Faessler, A. (Tuebingen Univ. (Germany, F.R.). Inst. fuer Theoretische Physik). 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780947. (CONF-840166—).

From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

We calculate the panti p annihilation at rest into mesons in the quark rearrangement model in which 3 quarks and 3 antiquarks rearrange into 3 mesons and in the quark annihilation model in which one or two quark-antiquark pairs are annihilated and a quark-antiquark pair is created. (orig./HSI).

32600 **(INIS-mf—9631) Twisted boundary conditions: a non-perturbative probe for pure non-abelian gauge theories.** Baal, P. van. (Rijksuniversiteit Utrecht (Netherlands)). 4 Jul 1984. 170p. NTIS (US Sales Only), PC A08/MF A01. File Number DE85780921.

Includes Dutch summary; 134 refs., 16 figs., 4 tabs.

In this thesis the author describes a pure non-abelian gauge theory on the hypertorus with gauge group SU(N). To test the flux tube picture he has studied the large distance limit of this theory, leading to a large coupling constant. To tackle this problem, he describes two approaches, in both of which twisted boundary conditions play an important role.

32601 **(ITEP—70(1983)) Quark-gluon model for particle production processes.** Volkovitskij, P.E. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1983. 20p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701007.

The quark-gluon model for hadronization of strings produced in soft and hard processes is suggested. The model is based on the distribution functions of valence quarks in hadrons which have correct Regge behaviour. The simplest case is discussed in which only the longitudinal degrees of freedom are taken into account.

32602 **(ITEP—169(1983)) Calculation of the $D^+\to$ anti ksup(0)esup(+)ωsub(e) transition formfactor and the Usub(cs) element of the Kobajashi-Maskawa matrix.** Aliev, T.M.; Eletsky, V.L.; Kogan, Ya.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1983. 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701006.

QCD sum rules for a three-point vertex function are used to determine the formfactor of vector current induced $D^+ \to$ anti K^0 transition. The following value is obtained fsub(+)sup(D → K) (0)=0.6+-0.1, as well as the constraint on the Usub(cs) element of the Kobayashimaskawa matrix, 0.9 < or approximately Usub(cs) < 0.97.

32603 **(JINR—E-2-84-12) Polarization effects in hadron fragmentation.** Lednicky, R. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1984. 6p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701008.

Hadron polarization (spin alignment) and polarization asymmetry are discussed in terms of the quark recombination model with the spin-orbit interaction taken into account. It is shown that predictions of this model are at least in qualitative agreement with experimental data. Various polarization mechanisms in terms of this model and the possibility of their checking are also discussed.

32604 **(JINR—R-2-84-232) Nonleptonic decays of charged baryons in chiral theory (account for baryon poles).** Pervushin, V.N.; Sarikov, N.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1984. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701003.

A phenomenological chiral lagrangian for weak baryon-baryon transitions bringing about pole contributions into amplitudes of nonlepton baryon decays is constructed. It is shown that the account of pole contributions gives a satisfactory description of P-wave (parity-preserving) decay amplitudes of strange baryons. P-wave amplitudes for decays of charmed baryons are calculated.

32605 **(PUC-TN—01/83) Pion deuteron scattering and the ΔN interaction.** Dosch, H.G.; Andrade, S.C.B. de; Ferreira, E.M.; Munguia, G.P. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). 1983. 9p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701442.

An analysis of π-d forward scattering yields an additional independent corroboration for a resonance at 2.15 GeV in the $^5S_2$, I=1, Δ-N channel.

32606 **(PUC-TN—24/83) Vertex function for pion-deuteron-dibaryon coupling.** Dosch, H.G.; Ferreira, E.M. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Sep 1983. 37p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701443.

The pion-deuteron-2^+ dibaryon vertex function and the influence on πd elastic scattering of a strong baryon-baryon interaction in the intermediate state are calculated. The general results of these investigation are the following. Near the ΔN threshold the contribution to the πd B_2 vertex function is largely dominated by the ΔN intermediate state. The vertex function falls off rapidly for energies above the ΔN threshold. The coupling of a possible 2^+ dibaryon resonance at 2.15 GeV to the πd system occurs mainly in an pound=1 wave. The contributions to πd helicity scattering amplitudes due to explicit ΔN interaction in the intermediate state are evaluated.

32607 **(PUC-TN—29/83) Quark model for baryons-negative parity states.** Amaral, M.G. do; Zagury, N. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Nov 1983. 29p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701446.

Under the assumption that quarks are confined by a relativistic central potential, $U(r)=1/2(1+\beta)(V_0+1/2Kr^2)$, and taking into consideration gluon exchange corrections, is calculated the mass spectrum for the negative-parity baryons.

32608 **(UM-P—84/41) Mechanism for coherent production of pions from the decay of resonances.** Lam, C.S.; Lo, S.Y. (Melbourne Univ., Parkville (Australia). School of Physics). 1984. 18p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701002.

Conditions and signatures for the induced emission of bosons from a microscopic device are discussed. Detailed formulae for a simple two-level model are derived. In this model the decay of N Δ-resonances residing in a microscopic volume V is discussed. It is shown that large amplification factors for unusual charge bunching of pions are obtained as a result of induced emissions.

32609 **(UM-P—84/51) Primordial deuterium and neutrino decays.** McKellar, B.H.J.; Pakvasa, S. (Melbourne Univ., Parkville (Australia). School of Physics). 1984. 22p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701004.

It is shown that Lindley's argument, that the primordial deuterium will be destroyed if there are neutrinos more massive than 5 MeV which decay into photons, can be extended to put limits on the photon branching ratio for neutrinos in the mass range 7.5 MeV -15 MeV. These limits are not satisfied by any models with a significant charged current coupling of the heavy neutrino to the electron.

32610 **(UWThPh—84-41) Proton decay in the potential model approach.** Falkensteiner, P.; Lucha, W.; Schoeberl, F. (Technische Univ., Vienna (Austria). 1. Inst. fuer Theoretische Physik). 1984. 6p. NTIS (US Sales Only), PC A02/ MF A01. File Number DE85701439.

A nonrelativistic potential model is employed for the discussion of proton decay. Within this potential model a numerical solution of the Schroedinger equation yields the meson wave functions, whereas the baryon wave functions are approximated by a superposition of Gaussian trial functions. The resulting energy level patterns of baryons as well as mesons are extremely satisfactory. Having this potential model at one's disposal one is able to drop the naive assumption of a spatial matrix element identical for all proton decay modes. The nucleon decay branching ratios are re-evaluated from the point of view of a realistic nucleon-meson overlap for different grand unified theories.

32611 **Possibility of searching for Higgs boson in t-quarkonium decays.** Chaichian, M.; Hayashi, M. (Department of High Energy Physics, University of Helsinki, Helsinki, Finland). *Physical Review* [*Section*] *D: Particles and Fields;* **32**: No. 1, 144-153(1 Jul 1985). Contract AC03-76SF00515.

We study the decays of t-quarkonium V, with particular attention to Higgs-boson production. Decay modes such as $V \to \gamma(,Z^0 \to)H\gamma$, $V \to \gamma(,Z^0 \to H$ $^3S_1(Y,psi)$, and $V \to Z^0 \to Hl^+l^-$ are also considered. These rates are found to be very small in the minimal (one-Higgs-doublet) model. We discuss shortly the consequences of a composite model for the Higgs boson and of enhanced coupling constants of a light Higgs boson to fermions in a two-Higgs-doublet scheme. The implications of a possible mixing between V and Z^0 on the production of V in e^+e^- collisions as well as in p-barp collisions are considered.

32612 **Looking for weak-boson compositeness via form factors.** Rizzo, T.G. (Ames Laboratory and Department of Physics, Iowa State University, Ames, Iowa 50011). *Physical Review* [*Section*] *D: Particles and Fields;* **32**: No. 1, 43-50(1 Jul 1985). Contract W-7405-ENG-82.

We examine the possibility that the composite structure of weak gauge bosons may first reveal itself through form-factor-like effects. We consider modifying the propagators and gauge-boson self-couplings with a simple parametrization of these composite-structure form factors, and examine a large number of processes where deviations from the standard model may be observed. Present data indicate the W, Z composite scale $\Lambda >$ or ≈ 0.1 TeV but future data from CERN LEP II may push $\Lambda > 1$ TeV. We find the process most sensitive to these form factors resulting from compositeness to be the reaction $e^+e^- \to W^+W^-$ because of the unique cancellations which take place in gauge theories.

32613 **Mixing of tt-bar bound states with the Z boson.** Franzini, P.J.; Gilman, F.J. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305). *Physical Review* [*Section*] *D: Particles and Fields;* **32**: No. 1, 237-246(1 Jul 1985). Contract AC03-76SF00515.

We take seriously the possibility that tt-bar bound states are within several GeV/c^2 of the Z-boson mass and make a careful study of this possible near degeneracy using the mass-mixing formalism. Most of the decay width of vector states below the open-top threshold comes from mixing with the Z. In the idealized situation where there is no coupling of the unmixed tt-bar state to e^+e^- and ff-bar, the amplitude for $e^+e^- \to$ff-bar has an exact zero at the unmixed mass. Correspondingly, in the physical situation of nonzero couplings, the cross section for $e^+e^- \to$ff-bar exhibits deep minima. We investigate as well the effects of complex mixing matrix elements above the open-top threshold, and calculate longitudinal polarization and forward-backward asymmetries, where there are large enhancements near tt-bar resonance masses.

32614 **Mixing of a heavy neutrino with the electron neutrino.** Gilman, F.J.; Rhie, S.H. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305). *Physical Review* [*Section*] *D: Particles and Fields;* **32**: No. 1, 324-326(1 Jul 1985). Contract AC03-76SF00515.

We show that recent monojet searches in electron-positron annihilation experiments can be used to extend significantly the limits on the mixing of a massive fourth-generation neutrino with the electron neutrino. When combined with other limits from hadron decays and secondary-vertex searches in hadron and electron-positron annihilation experiments, bounds of $'U_{14}'^2 <$ or $\approx 10^{-6}$ for neutrino masses of 10 MeV/c^2 to over 10 GeV/c^2 are obtainable by analysis of existing data.

32615 **Nonstandard Higgs bosons as a source of monojets.** Dawson, S.; Hinchliffe, I. (Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Physical Review* [*Section*] *D: Particles and Fields;* **32**: No. 1, 86-91(1 Jul 1985). Contract AC03-76SF00098.

Nonstandard Higgs-boson models are examined as a potential source for events with large missing P/sub t/ of the type recently seen by the UA1 group at CERN.

32616 **Systematics of πN scattering in chiral soliton models.** Mattis, M.P.; Peskin, M.E. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305). *Physical Review* [*Section*] *D: Particles and Fields;* **32**: No. 1, 58-73(1 Jul 1985). Contract AC03-76SF00515.

We study the spin and isospin structure of pion-nucleon scattering amplitudes in the class of models, including the Skyrme model, in which the nucleon arises as a soliton built of pion fields. We derive general energy-independent linear relations among partial-wave amplitudes for the processes $\pi N \to \pi N$ and $\pi N \to \pi \Delta$ and show that these relations are in reasonably good agreement with experiment.

32617 **Nucleon-nucleus reactions at ultrarelativistic energies.** Wong, C. (Oak Ridge National Laboratory, Oak Ridge, Tennessee). *Physical Review* [*Section*] *D: Particles and Fields;* **32**: No. 1, 94-114(1 Jul 1985).

In order to discern coherent processes from incoherent and collective processes in nucleon-nucleus reactions at high energies, we study these reactions with an incoherent-multiple-collision model. In this model, the projectile nucleon makes successive inelastic collisions with nucleons in the target nucleus, the probability of such collisions being given by the thickness function and the nucleon-nucleon inelastic cross section. It is assumed that each baryon-baryon collision produces particles and degrades momenta just as a baryon-baryon collision in free space, and that there are no secondary collisions between the produced particles and the nucleons. We found that the inelastic proton data, the pseudorapidity distribution data dN/sup p/A/deta, and the total nucleon-nucleus absorption data can be well explained by the incoherent-multiple-collision model. However, the single-particle fragmentation data for nonleading particles indicate that there is a reduction of the fragmentation cross section because of subsequent collisions of the leading baryon along the collision chain. Modification of the incoherent-multiple-collision model is suggested. The modified model gives cross sections for the reactions $pA \to \pi^+X$, $pA \to \pi^-X$, $pA \to K^+X$, $pA \to K^-X$, and pA→p-barX in the projectile fragmentation region in good agreement with experiment.

32618 **Phenomenological coupling of excited lepton to Z^0 and Z^0 decay to hard γ.** Kalyniak, P.; Sundaresan, M.K. (Department of Physics, Carleton University, Ottawa, Ontario, Canada K1S 5B6 and Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305). *Physical Review* [*Section*] *D: Particles and Fields;* **31**: No. 11, 2813-2817(1 Jun 1985). Contract AC03-76SF00515.

We explore the possibility of enhancing the decay $Z^0 \to e^+e\gamma$ with a hard photon through the existence of an excited spin-(1/2) lepton coupling to Z^0 and γ, while remaining consistent with constraints on these couplings from data on $e^+e^- \to \gamma\gamma$ and g-2. For an excited-lepton mass less than the Z^0 mass, we find that the rate can be enhanced but does not peak for high photon energies. We set lower limits on the couplings for the case of the excited lepton heavier than Z^0, as a function of mass of the heavy lepton.

32619 **New value for the electron asymmetry in $\Sigma \rightarrow ne\nu$ and hyperon semileptonic decays.** Bohm, A.; Kmiecik, M. (Center for Particle Theory, The University of Texas at Austin, Austin, Texas 78712). *Physical Review [Section] D: Particles and Fields;* **31**: No. 11, 3005-3007(1 Jun 1985).

Using the new value for *α*/sub e//sup Sigmaarrow-rightn/, fits of the hyperon-decay data are presented. They show that there is excellent agreement between the predictions of the Cabibbo model and the experimental data, except for perhaps two indications of minor corrections.

32620 **Soft hard scattering in the teraelectronvolt range.** Gaisser, T.K.; Halzen, F. (Physics Department, University of Wisconsin, Madison, Wisconsin 53706). *Physical Review Letters;* **54**: No. 16, 1754-1756(22 Apr 1985). Contract AC02-76ER00881.

Cross sections for the production of secondaries with large transverse momentum can become comparable to the total cross section in the teraelectronvolt energy range. We argue that the onset of this effect is observed at subteraelectronvolt energies via (i) an increase in the rapidity distribution near $y = 0$ (ii) an increase of <p/sub T/> with energy, and (iii) a correlation between <p/sub T/> and multiplicity. We discuss the implications for future hadron colliders and cosmic-ray experiments in the corresponding energy range.

32621 **Can relic neutrinos be observed.** Weiler, T. (Univ. of California, San Diego, La Jolla). *AIP (American Institute of Physics) Conference Proceedings;* No. 99, 60-75(1983). (CONF-820971—). Contract AS03-81ER40029.

From AIP conference on neutrino mass and gauge structure of weak interactions; Telemark, WI, USA (22 Sep 1982).

Within the framework of big-bang cosmology and the standard electroweak model, it appears that the only possibly detectable interaction of relic neutrinos is their annihilation with cosmic ray neutrinos on the Z resonance. However, measurement will require the existence of a large density of z ~ > 5 red-shifted sources with intense neutrino emission in the energy region 10^{21}eV^2/m/sub nu/.

6453 Particle Invariance Principles And Symmetries

REFER ALSO TO CITATION(S) 32635, 32658, 32879

32622 **(BONN-HE—84-26) Nicolai maps and stochastic observables from a coupling constant flow.** Dietz, K.; Lechtenfeld, O. (Bonn Univ. (Germany, F.R.). Physikalisches Inst.). Oct 1984. 38p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85751138.

Coupling constant flow equations are derived for supersymmetric scalar and gauge theories. These equations then serve as a starting point for the construction of Nicolai maps. From the fixed-point properties of the latter we establish a large class of stochastic functionals.

32623 **(IFT-P—10/83) P and T violations in QED.** Pleitez, V. (Instituto de Fisica Teorica, Sao Paulo (Brazil)). 1983. 32p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85700984.

An abelian gauge theory with violation of P and T symmetries, is constructed other features of usual spinor quantum electrodynamics are maintained. The theory is applied to some scattering processes with polarized and unpolarized electrons.

32624 **(PUC-TN—19/83) Phase diagram of the Z(4)-model.** Baltar, V.L.; Carneiro, G.M.; Pol, M.E.; Zagury, N. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). 1983. 24p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701408.

Systems with Z(4) global symmetry defined on a square lattice are studied both by Monte Carlo simulations and by the Migdal-Kadanoff renormalization group scheme. A phase diagram is obtained with quantitative predictions as to the location of the boundaries between the different phases. Four distinct phases are observed.

32625 **(PUC-TN—26/83) Dynamical symmetry breakdown in SU(5) and SO(10).** Shellard, R.C. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Sep 1983. 9p. (In Portuguese). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701409.

Some restrictions imposed upon Grand Unified Theories by dynamical symmetry breakdown are examined. It is observed in particular, that theories with SU(5) as symmetry group, with 3 or more fermion families undergo dynamical symmetry breakdown, and some of the fermions will acquire mass at the Grand Unified scale. On the other hand, the SO(10) group, with 3 families is free from this problem.

32626 **Unique chiral three-preon model of quarks and leptons.** Gipson, J.M.; Tosa, Y.; Marshak, R.E. (Physics Department, Virginia Polytechnic Institute and State University, Blacksburg, Virginia 24061). *Physical Review [Section] D: Particles and Fields;* **32**: No. 1, 284-292(1 Jul 1985).

A unique chiral three-preon model of quarks and leptons is deduced without referring to the resulting composite states. This model is based on the gauged E_6xSO(10) preon symmetry where E_6 and SO(10) are the metacolor and color-flavor groups, respectively. The model has several notable features. The anomalies of the underlying theory are reproduced by pseudo-Goldstone bosons which acquire masses on the SO(10) scale. The model predicts three generations of ordinary quarks and leptons when SO(10) descends to the standard group through SU(4)/sub C/ x SU(2)/sub L/ x SU(2)/sub R/ but not through SU(5) x U(1). It can explain the correct ordering of the gauge hierarchy in terms of the preonic structure of the Higgs composites. The model predicts a large number of exotic fermionic composites at relatively low energies.

32627 **Supersymmetric models for quarks and leptons with nonlinearly realized E_8 symmetry.** Ong, C.L. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305). *Physical Review [Section] D: Particles and Fields;* **31**: No. 12, 3271-3279(15 Jun 1985). Contract AC03-76SF00515.

We propose three supersymmetric nonlinear *σ* models with global symmetry E_8. The models can accommodate three left-handed families of quarks and leptons without incurring the Adler-Bell-Jackiw anomaly with respect to either the standard SU(3) x SU(2) x U(1) gauge group, or the SU(5), or SO(10) grand unifying gauge group. They also predict unambiguously a right-handed, fourth family of quarks and leptons. In order to explore the structure of the models, we develop a differential-form formulation of the Kahler manifolds, resulting in general expressions for the curvature tensors and other geometrical objects in terms of the structure constants of the algebra, and the squashing parameters. These results, in turn, facilitate a general method for determining the Lagrangian to quartic order, and so the structure of the inherent four-fermion interactions of the models. We observe that the Kahlerian condition $d\omega = 0$ on the fundamental two-form ω greatly reduces the number of the independent squashing parameters. We also point out two plausible mechanisms for symmetry breaking, involving gravity.

32628 **Nicolai maps on manifolds.** Claudson, M.; Halpern, M.B. (Department of Physics, University of California, Berkeley, California 94720). *Physical Review [Section] D: Particles and Fields;* **31**: No. 12, 3310-3313(15 Jun 1985). Contract AC03-76SF00098.

In spite of the presence of quartic fermion interactions, we construct Nicolai maps for the empty and filled sectors of the $N = 2$ supersymmetric *σ* model in $1+0$ dimensions. The maps form covariant Langevin-Fokker-Planck systems on arbitrary manifolds without boundary and describe Brownian motion along geodesics. On compact manifolds, these stochastic systems always equilibrate to the probability densities of the empty and filled supersymmetric ground states.

32629 **Nonminimal SU(5) model.** Huebsch, T.; Meljanac, S.; Pallua, S. (Zavod za Teorijsku Fiziku, Prirodoslovno-Matematiki Fakultet, University of Zagreb, Marulicev trg 19, 41000 Zagreb, Croatia, Yugoslavia). *Physical Review [Section] D: Particles and Fields;* **31**: No. 11, 2958-2963(1 Jun 1985). Contract AC03-76SF00515.

The existence of the solution of the symmetry-breaking problem SU(5)→SU(3) x SU(2) x U(1)/sub Y/→SU(3) x U(1)/sub Q/ is shown in a nonminimal model where the 75-dimensional Higgs field is used instead of the usual 24-dimensional one. The result is given in an explicit and simple form. The relevance of this solution to existing theories and to problems related to proton decay is discussed.

32630 **Model for maximal CP nonconservation.** Gronau, M.; Johnson, R.; Schechter, J. (Physics Department, Technion, 32000 Haifa, Israel). *Physical Review Letters;* **54**: No. 20, 2176-2179(20 May 1985). Contract AC02-76ER03533.

We display a model for the up and down quark mass matrices which permits, for any number of generations, the complete determination of the Kobayashi-Maskawa matrix in terms of the quark masses. We discuss in this framework the correlation between the quark mass spectrum and a maximal CP-nonconserving phase and also give an application to the four-generation case.

32631 **Supersymmetric quantum mechanics and large-N expansions.** Imbo, T.D.; Sukhatme, U.P. (Department of Physics, University of Illinois at Chicago, Chicago, Illinois 60680). *Physical Review Letters;* **54**: No. 20, 2184-2187(20 May 1985). Contract FG02-84ER40169.

Supersymmetric quantum mechanics is formulated for spherically symmetric potentials in N spatial dimensions. It is seen that the supersymmetric partner potential of a given potential can be effectively treated as being in N+2 dimensions. This fact is exploited in calculations using the shifted 1/N expansion. Also, the violation of the no-degeneracy theorem in one dimension by the Coulomb potential is seen as a consequence of this result.

REFER ALSO TO CITATION(S) 32600, 32615, 32627, 32629, 32753

32632 **(CBPF-NF—011/83) Gauge effect: an application to the electron self energy.** Doria, R.M. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 19p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701400.

The influence of the gauge rotation in perturbation theory is investigated. As an example, the fermion propagator is studied in a gauge invariant form. The calculation is parametrized for a straight line. A guage independent renormalization constant is obtained.

32633 **(CBPF-NF—017/83) Fourier analysis and Wilson loops.** Bollini, C.G.; Giambiagi, J.J. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701401.

The quantum average of the Wilson Loop is computed through Fourier analysis of the potentials and functional integration over the coefficients. Simple results are obtained in the Abelian case as well as in the N → finite limit of the non-Abelian theory.

32634 **(CBPF-NF—021/83) Simplified chiral superfield propagators for chiral constant mass superfields.** Srivastava, P.P. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 8p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701402.

Unconstrained superfield potentials are introduced to derive Feynman rules for chiral superfields following conventional procedure which is easy and instructive. Propagators for the case when the mass parameters are constant chiral superfields are derived. The propagators reported here are very simple compared to those available in literature and allow a manageable calculation of higher loops.

32635 **(CONF-820466—4) Supersymmetry, grand unification and proton decay.** Rudaz, S. (Minnesota Univ., Minneapolis (USA). School of Physics and Astronomy). 1982. Contract AC02-83ER40105. 15p. (COO—1764-439). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012395.

From 3. workshop on grand unification; Chapel Hill, NC, USA (15 Apr 1982).

In this talk, some phenomenological issues were reviewed pertaining to supersymmetric grand unified theories (SUSY GUTs), with special emphasis on new features for proton decay. 18 refs.

32636 **(CTA-IEAV-RP—020/82) Reflection of radially symmetrical sine-Gordon kinks in the origin.** Geicke, J. (Centro Tecnico Aeroespacial, Sao Jose dos Campos (Brazil). Inst. de Estudos Avancados). May 1983. 11p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85700980.

An explanation is given for the known numerical result that a spherical 2π-kink is reflected in $r = O$ as a kink (and not as an antikink like in one space dimension). In circular symmetry 2π-kinks are studied numerically. Besides the pulsons arising for small energies, no reflection is observed in $r = O$.

32637 **(CTA-IEAV-RP—021/82) Cylindrical pulsons in nonlinear relativistic wave equations.** Geicke, J. (Centro Tecnico Aeroespacial, Sao Jose dos Campos (Brazil). Inst. de Estudos Avancados). Jan 1982. 16p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85700981.

Numerical results to the Higgs scalar equation and the sine-Gordon equation with cylindrical symmetry are reported. Two separated energy regions are found where a Higgs kink develops into pulsons when reaching the origin $r = 0$, while only for higher energies a reflection is observed. The pulsons to both equations are studied in detail by modifying the initial kink shapes. In comparison with the spherical pulsons the cylindrical ones are extremely long-lived. For amplitudes slightly below half the distance between two (neighboured) vacua of the theories no decrease of the amplitudes and no perceivable radiation have been obtained by the numerical solution, examined during a time of order 1000. On the other hand, 'heavy' sine-Gordon pulsons (with amplitudes 3π - 4π) are found to decay fast during a time $t = 100$ in cylindrical symmetry.

32638 **(DESY—84-117) Light leptoquarks.** Schrempp, B.; Schrempp, F. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Dec 1984. 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751637.

The case is made for light spinless leptoquarks of the Goldstone boson type (m << Gsub(F)sup(-1/2)) in the framework of nearby compositeness and special technicolor schemes. Their expected experimental signatures are worked out in the light of recently observed anomalous events of the type μ^+ jet μ^- jet, 'monojet' and 'monophoton'.

32639 **(DOE/ER/70004—T2) Hierarchies in grand unification.** Johnson, R.J. (Oregon Univ., Eugene (USA). Inst. of Theoretical Science). Jun 1984. Contract AT06-76ER70004. 83p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE85011480.

The theoretical aspiration of unifying all interactions through the mechanism of a spontaneously broken gauge symmetry received some encouragement recently with the discovery of the W^{+-} and Z^0 electroweak bosons predicted in the Glashow-Weinberg-Salam model of spontaneously broken SU/sub L/(2)xU/sub Y/(2). However the null results from proton decay experiments have dampened the hope that SU(5) is the correct model and placed some doubt on whether experimental evidence for grand unification can ever be seen. This situation has prompted us to look for other tests of grand unification and in particular to examine the possibility and testability of models larger than SU(5) which can have intermediate scales of symmetry breaking. We have studied some low energy models containing two light Z bosons and confronted them with the electroweak neutral current data to determine whether or not they can consistently fit it and if so what it implies for the masses of the Z bosons. The electroweak neutral currents also provide us with information on the low energy values of the gauge couplings which we used to establish limits on the hierarchy scales in an SO(10) model. Finally we discuss the theoretical fine tuning problem that arises in any model with a large scale hierarchy. The problem lies in the Higgs sector and can be related to the existence of quadratic divergences in the Higgs mass parameter. A "naturalness" criterion for a grand unified theory requires the absence of these quadratic divergences in order to make the hierarchy stable under radiative corrections. We show in a large class of renormalizable quantum field theories that if there occurs a cancellation of quadratic divergences for the scalar mass terms, then the only interaction structure allowed is that of supersymmetry. 63 refs.

From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

It is the purpose of this talk to report on a first attempt to apply (non-perturbative) techniques of many-body theory to a field-theory of the Yang-Mills-type. The procedure is in principle analogous to lattice calculations: In order to make the field-theoretical hamiltonian a well-behaved operator in the Fock-space, a phase-space-cutoff is assumed for the definition of the field operators. The coupling constant g then becomes a function of this cutoff which is fixed by some physical property like a glue-ball mass. (orig./HSI).

From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

In the strong coupling limit the SU(N) gauge model at finite temperature reduces to an effective Z(N)-symmetric spin model for the thermal Wilson-line. Within the framework of this model we determine the order of the SU(N) deconfinement transition and study the influence of fundamental matter fields on this transition: We find a second order phase transition for SU(2) and first order transitions for all SU(N), N>=3. In the presence of sufficiently light particles in the fundamental representation this transition gets destroyed. (orig.).

From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

Using the pseudofermion Monte Carlo method we investigate the chiral and the deconfinement phase transitions in the SU(3) gauge theory with dynamical staggered fermions on a 6^3x2 lattice. Both the energy density of the gluonic sector epsilonsub(G) and the order parameter <PSI anti PSI> are found to have a rapid variation in $\beta(=6/g^2)$, which is similar to that observed in the quenched theory but at a smaller value of β. (orig.).

A conformally invariant equation of the second order for the symmetric tensor field in the Riemannian space of an arbitrary dimension is suggested. The operator of the conformal momentum acting in the space of solutions of this equation is constructed. It is shown that the trace of the energy-momentum tensor vanishes.

32649 (PUC-TN—18/83) **Introduction to Quantum Chromodynamics.** Shellard, R.C. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Jun 1983. 73p. (In Portuguese). NTIS (US Sales Only), PC A04/MF A01. File Number DE85701404.

A pedagogical over view of Quantum Chromodynamics, emphasying its pertubative as well as its non-pertubative aspects is given. The renormalization group; aplications of QCD to parton models, gauge theories in a lattice, instantons and the theta angle and problems associated to chiral symmetry breaking are studied.

32650 (PUC-TN—21/83) **Breakdown of the 1/N expansion in the continuum limit of strong coupling lattice QCD.** Bralic, N.; Loewe, M. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Aug 1983. 17p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701405.

The restoration of Lorentz covariance in the continuum limit of strong coupling lattice QCD is shown to require the breakdown of the 1/N expansion. With the leading 1/N appoximation becoming irrelevant in that limit. To leading order in 1/N Lorentz convariance can be restored only as an approximate long distance symmetry a non conventional continuum limit with a non Hermitian-Hamiltonian.

32651 **(PUC-TN—22/83) Monte Carlo method in field theories.** Carvalho, C.A. de. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Aug 1983. 20p. (In Portuguese). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701406.

An introduction to the Monte Carlo method in field theories is presented and, as an example, its application to the study of lambda phi 4 theory is discussed.

32652 **(PUC-TN—23/83) Domain walls at finite temperature.** Carvalho, C.A. de; Marques, G.C.; Silva, A.J. da; Ventura, I. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Aug 1983. 38p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701407.

It is suggested that the phase transition of lambda phi 4 theory as a function of temperature coincides with the spontaneous appearance of domain walls. Based on one-loop calculations, T sub(c) = 4M/√ lambda is estimated as the temperature for these domains to because energetically favored, to be compared with T sub(c) = 4.9M/√ lambda from effective potential calculations (which are performed directly in the broken phase). Domain walls, as well as other Types of fluctuations, disorder the system above T sub(c), leading to <phi>=0. The critical exponent for the specific heat above T sub(c) is computed; and α=2/3 + 0 (√ lambda) is obtained.

32653 **Gauge field propagator for QED and linearized QCD in inhomogeneous media.** Bickeboeller, M.; Goldflam, R.; Wilets, L. (Institute for Nuclear Theory, Department of Physics, FM-15, University of Washington, Seattle, Washington 98195). *Journal of Mathematical Physics (New York);* **26**: No. 7, 1810-1817(Jul 1985).

The gauge field propagator is calculated in configuration space using an expansion in spherical harmonics for the scalar Green function and in vector spherical harmonics for the tensor Green function. We work in the Coulomb gauge where the scalar Green function is instantaneous and the frequency-dependent tensor Green function is transverse. Explicit expressions are obtained to solve for the propagators in the presence of inhomogeneous dielectric media.

32654 **Exact ground-state properties of the SU(2) Hamiltonian lattice gauge theory.** Chin, S.A.; van Roosmalen, O.S.; Umland, E.A.; Koonin, S.E. (Department of Physics, University of California at Los Angeles, Los Angeles, California 90024). *Physical Review [Section] D: Particles and Fields;* **31**: No. 12, 3201-3212(15 Jun 1985). Contract AC02-76ER03074.

The SU(2) Hamiltonian lattice gauge theory is shown explicitly to be equivalent to a nonrelativistic quantum many-body problem in S^3. By exploiting this equivalence, a many-body Monte Carlo algorithm is devised to solve for its ground-state properties. To the extent that a trial wave function consisting of a product of single-plaquette functions is a good approximation to the exact ground state, the present Monte Carlo method is shown to be an efficient means of calculating the ground-state energy with high precision.

32655 **Axial and parity anomalies and vacuum charge: A direct approach.** Boyanovsky, D.; Blankenbecler, R. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305). *Physical Review [Section] D: Particles and Fields;* **31**: No. 12, 3234-3250(15 Jun 1985). Contract AC03-76SF00515.

We study the axial and parity anomalies in Abelian gauge theories using the direct yet intuitive approach of counting the relative number of states of one chirality with respect to the other. A fundamental gauge-invariant quantity, the determinantal ratio, is introduced for this purpose. We find that the number of states is conserved and that the gauge fields differentially phase shift states of opposite chirality at infinite energies. This implies a relative flow of states at very large energies which must be compensated by a rearrangement of the density of states at finite energies. We then derive a sum rule which yields two alternative formulas for the index of a Dirac operator. One expresses the index in terms of its high-energy behavior, and the other in terms of the low-energy properties; these are the "zero modes" of definite chirality. Two examples are worked out in detail to clarify our general result. The physics of the axial anomaly is shown to translate into that of the parity anomaly in 2+1 dimensions, in which parity and chirality have interchanged roles. We also analyze the vacuum charge in regard to its high- and low-energy origin. The possibility of spectral flow is formulated and briefly discussed. In short, we provide a physical interpretation of certain mathematical indices, relate them to an extended version of Levinson's theorem of potential scattering, and simplify their evaluation.

32656 **Localization of the dyon charge.** Sen, A.; Yamagishi, H. (Fermi National Accelerator Laboratory, P.O. Box 500, Batavia, Illinois 60510). *Physical Review [Section] D: Particles and Fields;* **31**: No. 12, 3285-3287(15 Jun 1985). Contract AC02-76ER03069.

We consider three possible expressions for the dyon charge in the presence of fermions. We find that although none of them fully admit an interpretation as a localized charge, one expression may be identified as the core charge under suitable conditions. Comparison with Callan's expressions are also made.

32657 **Crossover from strong to weak coupling in lattice gauge theory with dynamical fermions.** Kogut, J.B.; Polonyi, J.; Wyld, H.W.; Sinclair, D.K. (Department of Physics, University of Illinois at Urbana-Champaign, 1110 West Green Street, Urbana, Illinois 61801). *Physical Review [Section] D: Particles and Fields;* **31**: No. 12, 3304-3306(15 Jun 1985).

Using microcanonical simulation techniques we study SO(3) gauge theory with dynamical quarks and contrast the results with quenched simulations. We measure the expectation values of the gauge action, psi-barpsi, and the Z_2 monopole current density. We locate the first-order bulk transition in the quenched case by exhibiting metastable states and find that the effect of the light dynamical fermions on the transition is simply a shift in the critical coupling.

32658 **Thermodynamics of SU(2) gauge theory with dynamical, light fermions.** Kogut, J.B.; Polonyi, J.; Wyld, H.W.; Sinclair, D.K. (Department of Physics, University of Illinois at Urbana-Champaign, 1110 West Green Street, Urbana, Illinois 61801). *Physical Review [Section] D: Particles and Fields;* **31**: No. 12, 3307-3309(15 Jun 1985).

Using microcanonical computer-simulation techniques we study the finite-temperature phase transitions in SU(2) gauge theory with four light-quark species. The chiral-symmetry-restoration transition is found by studying the order parameter <psi-barpsi>. The theory's Wilson line, Wilson-line correlation function, and internal energies are measured in the vicinity of the transition. The Wilson line and its correlation function are smooth, apparently analytic functions of the physical temperature. These results are contrasted with their SU(3) counterparts.

32659 **Second-order fermion masses.** Leung, C.N.; Robinett, R.W.; Rosner, J.L. (Univ. of Minnesota, Minneapolis). *AIP (American Institute of Physics) Conference Proceedings;* No. 99, 202-206(1983). (CONF-820971—). Contract AC02-76ER01764;AC02-82ER40073.

From AIP conference on neutrino mass and gauge structure of weak interactions; Telemark, WI, USA (22 Sep 1982).

An SO(10) model with the lowest-energy symmetry breaking arising from two members of a 16-plet of Higgs bosons can lead to fermion masses if, in addition to fermion 16-plets, there are heavy fermions belonging to SO(10) singlets. Some consequences of this model for neutrino masses are explored briefly.

32667 **(DOE/ER/40030—4A) Medium energy measurements of n-n parameters. Progress in research, January 1-December 31, 1984.** (Texas Univ., Austin (USA). Dept. of Physics). Dec 1984. Contract AS05-81ER40030. 36p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85007065.

The purpose of this report is to summarize our progress in medium energy research during 1984. Our research program is one principally involving medium energy nucleon-nucleon experiments at LAMPF. It is collaborative effort involving the University of Texas, Los Alamos National Laboratory, and other research groups, most notably the UCLA Medium Energy Physics group. The aim of the experimental program is the determination of the nucleon-nucleon amplitudes at medium energy. The required data include both elastic and inelastic experiments, and in addition the measurements of polarization and polarization transfer parameters. The progress reported here is progress involving the collaborative research program as a whole. We emphasize the research work that the University of Texas group is most concerned with. Publications are listed.

32668 **(INIS-mf—9303) Study of the energy and angular dependence of the final state interaction (αn) in the reaction ^{4}He(d,pα)n with polarized deuterons.** Oswald, H. (Koeln Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet). 17 Dec 1983. 79p. (In German). NTIS (US Sales Only), PC A05/MF A01. File Number DE85780925.

With 43 refs.

In a complete coincidence experiment the reaction ^{4}He(d vector, p α)n was measured at different deuteron incident energies. Thereby in a range of kinematical situations of the final state interaction (FSI) of the α-n subsystem the dependence on the incident energy between 6 and 11 MeV (thetasub(cm)(FS)=111°) and production angles between 90° and 140° (Esub(d)=7 MeV) was systematically studied. Beside the absolute differential cross sections also the vector analyzing powers Asub(y) and for one incident energy (Esub(d)=10 MeV) also the tensor analyzing power Asub(zz) were determined. The data were compared with Faddeev calculations on the α-d system of Koike. The agreement is generally good for the analyzing power. The cross section is qualitatively reproduced with large quantitative deviations for the low incident energies and good agreement at Ed>=10 MeV. The measurements suggest to improve the simple potentials and the crude regardment of the Coulomb interaction in the theoretical calculations. (HSI).

32670 (ITF—83-98-R) **Dependence of three-nucleon low-energetic parameters on the number of considering in p-matrix egien states of six-quark bag.** Petrov, N.M.; Pushkash, A.M. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1983. 18p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701019.

The dependence of two- and three-nucleon low-energy parameters on the choice of P-matrix approximation is investigated using the NN-interaction simple model. The account of pole components in P-matrix which correspond to six-quark states results in the triton binding energy essential decrease and increase in doublet nd-scattering length.

32671 (JINR—R-4-84-15) **Description of (^{7}Li, ^{7}Be) charge-exchange reactions within the framework of microscopic DWBA.** Bang, E.; Gareev, F.A.; Kazacha, G.S.; Goncharov, S.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1984. 13p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701020.

The formalism of the (^{7}Li, ^{7}Be) charge-exchange reaction description is based on microscopic distored wave Born approximation is presented. Only the central effective NN-interaction components are considered. The transition densities for ^{7}Li-^{7}Be are calculated in two models: the one-particle shell model and the cluster one. In the latter the recoil effect is taken into account exactly. The formalism is tested with calculations of the form factors and differential cross sections on (^{7}Li, ^{7}Be) reactions in ^{6}Li and ^{40}Ca target-nuclei.

32672 (JINR—R-4-84-135) **Description of Elambda - transitions taking into account of phonon components in wave functions of odd deformed nuclei.** Bastrukov, S.I.; Nesterenko, V.O. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1984. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701016.

An expression of reduced probability of electrical transitions in deformed odd-A nuclei is obtained within the quasiparticle-phonon model. The commutation relations between quasiparticle and phonon operators, taking into account the quasiparticle structure of phonons, are used. It is shown that corrections arising in such approach can result in a significant change in the reduced probability value (1.5-2 times).

From Conference on antinucleon and nucleon-nucleus interactions; Telluride, CO, USA (18 Mar 1985).

At the 1982 Telluride Conference Magda Ericson spoke about the interest in a measurement of the σ vector . q vector or spin-longitudinal nuclear response function. It inspired our collaboration to propose a LAMPF experiment, which was subsequently approved, and run in September 1983. In the intervening time the interest has increased dramatically in connection with the European Muon Collaboration (EMC) effect, and the exciting possibility that this ultra high-energy physics result may have to do with nuclear pions - and, hence, the isovector σ vector . q vector nuclear response function. In this talk I will give a brief introduction to the EMC effect and its interpretation in terms of excess nuclear pions. This model establishes a connection between the vastly different scales of the EMC experiment (~ 200 GeV deep-inelastic muon scattering) and the Los Alamos experiment (500 MeV polarized-proton quasifree scattering). Following this I will describe the Los Alamos experiment and its interpretation in terms of excess nuclear pions. Finally I will indulge in some speculation about quark effects in nuclei based on the EMC and Los Alamos experimental results. 29 refs.

32674 (LYCEN—8409) **Pion nucleon-nucleon system in a three-body model with heavy meson exchanges. Application to: πd-πd, πd-NN and NN-NN at intermediate energies.** Perrot, J.L. (Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire; Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires). 1984. 87p. (In French). NTIS (US Sales Only), PC A05/MF A01. File Number DE85751336.

An extension of the three-body Faddeev-Lovelace equations proposed by Avishai and Mizutani in order to take into account the pion absorption in the pion-nucleon-nucleon (xNN) system has been used to describe simultaneously the xd <--> xd, xd <--> NN and NN <--> NN reactions at intermediate energies. The main aspect of this work concerns the introduction of heavy mesons (HM) exchanges. The effect of HM exchange is investigated at first in NN elastic scattering bove the pion production threshold, and then in the xd <--> NN reaction and xd elastic scattering. An extensive comparison between theory and experiments is done for these three reactions in the energy range of the Δ_{33} resonance.

32675 (NAC-AR—84-01, pp 164-166) **Report of the Van de Graaff Group: nuclear reactions and nuclear structure. 32678 **Mechanism of ^{3}He(π^{-},pn) reaction.** Lee, T.H. (Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review* [*Section*] *C: Nuclear Physics;* **31**: No. 6, 2163-2167(Jun 1985). Contract W-31-109-ENG-38.

The π^{-} absorption by ^{3}He is investigated in a model study based on the nucleon pole mechanism $\pi NN \rightarrow NN \rightarrow NN$. We find that the amplitude of the three-body rescattering mechanism can have a strong interference effect with the amplitude of the direct two-body absorption process even in the region where the two-body process dominates. The main experimental signature of this important coherent effect is a sharp peak near the high energy end of the proton spectrum measured in a coincident experiment. Our results suggest that in order to extract the isospin dependence of pion absorption by a pair of nucleons from the recent ^{3}He(π^{+-},NN) data, the three-nucleon rescattering amplitude must be calculated accurately and included coherently in the analysis.

32679 (DOE/ER/40048—126) **Determination of the total reaction cross section for heavy ions at 15 MeV/amu, 25 MeV/amu, and 35 MeV/amu.** Loveman, R.A. (Washington Univ., Seattle (USA)). Nov 1984. Contract AC06-81ER40048. 132p. NTIS, PC A07. File Number DE85011445.

The differential elastic cross sections for ^{12}C + ^{12}C and ^{12}C + ^{90}Zr were measured at 15 MeV/amu, 25 MeV/amu, and 35 MeV/amu. The differential cross sections were then fit with standard models to determine the total reaction cross sections at these energies. At energies below 15 MeV/amu the total reaction cross section is geometric. We found neither system could be described by a simple geometric model for these three energies. The total reaction cross sections were compared with calculations made using the optical limit of Glauber theory. These calculations predicted that the total reaction cross section should decrease with increasing energy for the carbon carbon system and should remain constant for the carbon zirconium system. This corresponds to an increase in transparency of about twelve percent over this energy range for both systems. The Glauber model predictions were found to be quite accurate for the carbon system but were completely inconsistent with data for the carbon zirconium system. The predicted values for the total reaction cross section were found to be too small at the low energy and too large at the high energy. The increase in transparency in the carbon zirconium system was twice that of the carbon carbon system. 40 refs.

32680 (GANIL-P—84-11) **First results from GANIL.** Detraz, C. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)). Sep 1984. 14p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751330.

The aim of the first experiment at GANIL was to examine the variation of the N/Z ratio for projectile like fragments when the incident energy increases. Results presented bring confliding evidences. Some conclusions are drawn. The process pointed to by some of the results shown is examined in detail. The relative velocities of projectile and target at GANIL energies incompass the Fermi velocity. Already a few experiments which use the high energy and high intensity of the beam bring results dealing with the nuclear structure. Then results are reviewed.

32681 (GANIL-P—84-16) **Secondary beams at GANIL.** Langevin, M.; Anne, R. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)). 1984. 19p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751341.

The LISE facility at the French national heavy ion accelerator GANIL was designed for the production of secondary beams of good optical quality. The first experimental results obtained in atomic physics, radioactive beams production and search for new nuclear species are briefly reported.

Response function of nuclei to spin-isospin excitation has been studied by (^3He,t) reaction at Saturne Facility. (^3He,t) at intermediate energy is very selective for spin-isospin excitations. Besides Gamow-Teller resonance and other multipolarities spin-isospin resonances, a strong Δ excitation is observed. Two explanations are considered: Δ-hole collective states or quasi free production.

32687 (ISN—84-25) **Inelastic scattering of polarized protons and nuclear deformation in ^{16}O, ^{18}O.** de Swiniarski, R.; Pham, D.L. (Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires). 1984. 9p. (CONF-8406243—1). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751306.

From Europhysics conference on nuclear reactions; Crete, Greece (24 Jun 1984).

Many data concerning inelastic scattering of polarized protons at intermediate energy are now available. We have analyzed some of these data coming from LAMPF at 800 MeV for ^{16}O (6) and ^{18}O (7) in order to further study nuclear deformations for these light nuclei. Analyzing powers (A(theta)) and cross-sections ((σ/theta)) for elastic and inelastic scattering of 800 MeV polarized protons from ^{16}O and ^{18}O have been analyzed in the coupled-channels (CC) collective model using the code ECIS from Raynal.

32688 (JINR—1-83-908) **Comparative analysis of proton and alpha-particle interactions with C, O and Ag, Br nuclei at 4.5 GeV/c per nucleon.** Bogdanov, V.G.; Plyushchev, V.A.; Vokal, S.; Tolstov, K.D.; Shabratova, G.S.; Shumbera, M.; Karabova, M.; Togoo, R. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1983. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701023.

The comparative analysis of proton and alpha-particle interactions with C, O and Ag, Br nuclei at 4.5 GeV/c per nucleon is carried out. The correct selection of events with free hydrogen among all the inelastic interactions permitted to find the difference between the multiplicity distributions of particles from disintegration of light nuclei and disintegration of heavy ones in their peripheral collisions with nuclei projectiles. It is observed that the increasing of the projectile mass in collisions with target light nuclei leads to the decrease of normalized multiplicities of s-particles, average number of b-particles while the average number of g-particles does not change. Increasing of angular distributions of s- and g-particles is also observed. The comparison of angular distributions of the slowest (b) particles with the calculation of cascade evaporation model shows the applicability of classic evaporation for collisions with Ag, Br nuclei. In the case of C, O nuclei this applicability is questionable.

32689 (KIYI—83-12, pp 11-14) **(p,d) and (p,t) reactions on ^{9}Be at Esub(p)=50 and 72 MEV.** Zaika, N.I.; Mokhnach, A.V.; Rudchik, A.T.; Semenov, V.S.; Shityuk, V.A.; Shmarin, P.L. 1983. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE85781033.

In Nuclear and physical researches on the isochronous cyclotron U-240 during 1982.

Analysis of differential cross sections of ^{9}Be(p,d)^{8}Be (Esub(sup(8)Be))* 0; 2.94; 16.91; 19.22 MeV) and ^{9}Be(p,t)^{7}Be (Esub(sup(7)Be))* 0; 4.57 MeV) reactions at Esub(p)=50 and 72 MeV is conducted using the method of distorted waves with account of finite-range interaction in the supposition of pickup mechanism. Accountancy of heavy pickup mechanism of ^{7}Li cluster made it possible to improve agreement with differential cross section of ^{9}Be(p,d)^{8}Be reaction at large angles.

32690 **(LA-UR—85-1961) R-matrix analysis of the ^{7}Li system with peripheral channel overlap exchange effects.** Hale, G.M. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 5p. (CONF-850507—18). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012751.

From International conference on nuclear data for basic and applied science; Santa Fe, NM, USA (13 May 1985).

The parameters of an R-matrix analysis that includes data for all reactions open in the ^{7}Li system at E/sub x/ ≦ 10 MeV suggest that deuteron exchange contributes to the low-energy ^{6}Li(n,t) reaction. A method for including this mechanism directly in the theory is discussed and preliminary results are given.

32691 **(LBL—18944) Gamma-ray production cross sections for alpha-particle induced reactions on ^{19}F and ^{23}Na.** Norman, E.B.; Lesko, K.T.; Chupp, T.E.; Schwalbach, P.; De Faccio, M.A. (Lawrence Berkeley Lab., CA (USA); Washington Univ., Seattle (USA). Nuclear Physics Lab.). May 1985. Contract AC03-76SF00098. 6p. (CONF-850507—16). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012603.

From International conference on nuclear data for basic and applied science; Santa Fe, NM, USA (13 May 1985).

Production cross sections have been measured for γ-ray lines excited in α-particle bombardments of a NaF target for beam energies from 4.5 to 26 MeV.

32692 **Measurement of the ^{16}N(2^{-},g.s.)→ ^{16}O(0 $^{+}$,g.s.)+e^{-} +nu-bar/sub e/ beta-decay branching ratio.** Heath, A.R.; Garvey, G.T. (Argonne National Laboratory, Argonne, Illinois 60439 and University of Chicago, Chicago, Illinois 60637). *Physical Review [Section] C: Nuclear Physics;* **31**: No. 6, 2190-2198(Jun 1985). Contract W-31-109-ENG-38.

The ^{16}N(2^{-},g.s.)→ ^{16}O(0 $^{+}$,g.s.)+e^{-} +nu-bar/sub e/ branching ratio is remeasured. A flatfield magnetic spectrometer, instrumented with a multiwire position-sensitive proportional detector, is used. A value for the branching ratio Γ/sub β/(2^{-}→0^{+})/Γ/sub β/(2^{-}) = 0.2811 +- 0.0064 is determined. Combining this result with another recent determination produces a best value for this branching ratio. This in turn allows a more precise determination of the beta-decay rate (Λ/sub β/) for the process ^{16}N(0^{-}, 120 keV)→ ^{16}O(0^{+},g.s.)+e^{-} +nu-bar/sub e/. A value Λ/sub β/(0^{-}→0^{+}) = 0.489 +- 0. 020 sec^{-1} is obtained, which agrees with calculation only when pion exchange currents are included in the nucleon axial current.

32693 **E2 strength of the lowest resonance in ^{6}Li(α,γ): Collective effects in the 1p shell.** Nelson, J.E.; Napolitano, J.; Freedman, S.J. (Physics Division, Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review [Section] C: Nuclear Physics;* **31**: No. 6, 2295-2296(Jun 1985). Contract W-31-109-ENG-38.

We have measured the ratio of resonance strengths for alpha capture on ^{6}Li to the 4.77- and 5.16-MeV states of ^{10}B. We find ωγ(4.77)/ωγ(5.16) = 0.102 +- 0.004. When combined with the accepted value for ωγ(5.16) we determine the E2 strength of the 4.77- to 0.72-MeV level transition in ^{10}B to be B(E2) = 21 +- 2 e^{2}fm^{4}, in agreement with a previous measurement when center-of-mass corrections are properly taken into account. The agreement between our result and Kurath's interpretive model for ^{10}B improves when collective effects in the 1p shell are included.

32694 **Subthreshold pion production: An intranuclear N-N collision interpretation.** Blann, M. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Physical Review Letters;* **54**: No. 20, 2215-2217(20 May 1985). Contract W-7405-ENG-48.

π^{0} production cross sections are calculated with use of a Boltzmann master equation which assumes a nucleon-nucleon collision relaxation mechanism for the reaction of 35 MeV/nucleon ^{14}N with ^{27}Al, ^{58}Ni, and ^{184}W targets, and for ^{12}C+ ^{12}C at energies of 60, 74, and 84 MeV/nucleon. Results support a nucleon-nucleon collision mechanism as one possible interpretation of experimental yields.

From International school of atomic and nuclear heavy ion interactions; Poiana Brasov, Romania (28 Aug 1984).

Projectile and nuclear fragmentation are defined and processes referred to are recalled. The two different aspects of fragmentation are considered but the emphasis is also put on heavy ion induced reactions. The preliminary results of an experiment performed at GANIL to study peripheral heavy ions induced reactions at intermediate energy are presented. The results of this experiment will illustrate the characteristics of projectile fragmentation and this will also give the opportunity to study projectile fragmentation in the transition region. Then nuclear fragmentation is considered which is associated with more central collisions in the case of heavy ion induced reactions. This aspect of fragmentation is also illustrated with two heavy ion experiments in which fragments emitted at large angle have been observed.

From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

The reactions Ca+Ca and Nb+Nb at 400 MeV/nucleon have been studied at the Bevalac using the Plastic Ball spectrometer. A global analysis of the events shows two nontrivial collective flow effects: 1) The projectile fragments are found slightly displaced from the beam axis (bounce-off). 2) The intermediate rapidity fragments have a preference for emission angles of 20 to 30 degrees in the center of mass system (side-splash) for the higher multiplicity events of Nb+Nb which is not so evident for Ca+Ca. Neither effect is seen in a knock-on cascade calculation. A simulation with an event generating statistical model has been done in order to extract the magnitude of the effects. (orig.).

32699 (ISN—84-26) **Parity non-conservation in the radiative capture of polarized neutrons by ^{35}Cl.** Avenier, M.; Bagieu, G.; Benkoula, H.; Cavaignac, J.F.; Idrissi, A.; Koang, D.H.; Vignon, B.; Wilson, R. (Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires). Apr 1984. 18p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751294.

We report a measurement of the forward-backward asymmetry in the radiative capture of polarized cold neutrons in the reaction ^{35}Cl(n,γ)^{36}Cl where ^{36}Cl is in the ground state. The measured value of the asymmetry is a = (1.57 +- 0,531 10^{-4}. We deduce the mixing between the 2^+ capture level and the neighboring 2^- level to be <2^-/Hsub(pv)/ 2^+ > = - (0.25 +- 0.08) eV before corrections. A measurement of the integral asymmetry of all gamma rays in the neutron capture by ^{35}Cl leads to agreement with measurements at Leningrad.

32700 (LYCEN—8349) **Study of the light particle emission in the transition region of mechanisms on SARA.** Guinet, D. (Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire; Lyon-1 Univ., 69 - Villeurbanne (France)). 1984. 85p. (In French). NTIS (US Sales Only), PC A05/MF A01. File Number DE85751293.

The results of one of the first experiments on SARA are given. ^{14}N+^{27}Al reaction with a 420 MeV Nitrogen beams has been studied. The experimantal techniques, peculiarly a simple study of the CSI (Na) and BGO crystals, are reported. Then the experimental results are presented, reaction mechanism are described and analyzed. We try to fit the fragmentation process with the Goldhaber and Friedman models. the isotope production for Z=1, 2 is analyzed in the frame of the coalescence model and of the hot liquid nuclear matter drop model. Our exclusive measurements bring some new informations about the different mechanisms origin. To conclude, a code coupling reaction dynamics and preequilibrium emission is described and results are compared with the experimental data.

32701 (IAE—3790/2) **Project of an experiment on search for the neutrinoless double beta decay of ^{48}Ca.** Bakalyarov, A.M.; Balysh, A.Ya.; Kondratenko, I.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1983. 55p. (In Russian). NTIS (US Sales Only), PC A04/MF A01. File Number DE85701024.

A study is made on possibilities of experimental search for the neutrinoless double beta decay. The up-to-date theoretical aspects of the problem, different mechanisms of 2β(0ν)-decay, matrix element values are discussed. The experiment flow sheet is suggested, the expected backgrounds of the device are calculated. It is shown that the use of $\beta 4^{8}$Ca isotope in amounts of 10g may increase the experimental limit with respect to half-decay period up to Tsub(1/2) >= 2x10^{22} years, which corresponds to the upper limit for msub(ν) <= 20 eV Majorana mass of electron neutrino.

32702 (INIS-mf—9299, pp 34-44) **Participant region radii from 4 π detection of proton-proton correlations in relativistic heavy ion reactions.** Wieman, H.; Gustafsson, H.A.; Gutbrod, H.H.; Kolb, B.; Loehner, H.; Ludewigt, B.; Poskanzer, A.M.; Renner, T.; Riedesel, H.; Ritter, H.G. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.); California Univ., Berkeley (USA). Div. of Nuclear Science). 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780947. (CONF-840166—).

From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

We report here source radii as a function of event charge multiplicity for two different reactions; ^{40}Ca on Ca and ^{93}Nb on ^{93}Nb both at 400 MeV/nucleon. In both cases the radii are well fit with the same cube root dependence on charge particle multiplicity. The proton-proton correlations used in this study were measured at the Bevalac with the plastic ball detector, a device with several features that are particularly useful in this application. (orig./HSI).

32703 (IPNO-DRE—83-21) **Excitation of ΔL=0 spin-flip transitions in the N=28 isotones by 201 MeV proton inelastic scattering.** Djalali, C.; Marty, N.; Morlet, M.; Willis, A.; Jourdain, J.C.; Anantaraman, N.; Crawley, G.M.; Galonsky, A.; Duffy, J. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). 1983. 32p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85751328.

The excitation of 1^+ states by inelastic scattering of 201 MeV protons studied previously on the N=28 nuclei ^{48}Ca and ^{51}V, has been pursued on ^{50}Ti, ^{52}Cr and ^{54}Fe; for the three latter nuclei many sharp states are observed which have a very forward peaked angular distribution characteristic of a ΔL=0 transition. The results agree reasonably well with (e,e') measurements. A comparison with (γ vector, γ) results demonstrated the 1^+ nature of these states. The data are compared with DWIA calculations performed using the shell model wave functions of Metsch and Knuepfer. This comparison indicates that the isoscalar excitations are probably weaker than predicted. The ratio of experimental to predicted cross sections ranges from 0.25 for ^{50}Ti to 0.44 for ^{54}Fe.

32708 (BNL—36439) **Specificity of ^{71}Ga(p,n)^{71}Ge at 35 MeV for Gamow-Teller strength.** Baltz, A.J.; Weneser, J.; Brown, B.A.; Rapaport, J. (Brookhaven National Lab., Upton, NY (USA); USDOE, Washington, DC; Michigan State Univ., East Lansing (USA); Ohio Univ., Athens (USA)). 1985. Contract AC02-76CH00016. 7p. (CONF-850315—3). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011837.

From Conference on antinucleon and nucleon-nucleus interactions; Telluride, CO, USA (18 Mar 1985).

The motivation for considering the ^{71}Ga(p,n)^{71}Ge reaction is to help determine the properties of ^{71}Ga as a detector of solar neutrinos. The proposed solar neutrino experiment, ^{71}Ga(nu,e$^-$)^{71}Ge, has a threshold of only .236 MeV, and is thus sensitive to neutrinos produced in the basic burning process in the sun p + p → ^{2}H + e$^+$ + nu, which has a .420 MeV endpoint. The excitation of the (5/2)$^-$ state at .175 MeV in ^{71}Ge could be important, however. Were the Gamow-Teller (G-T) transition to the 175 keV state equal in strength to the ground state transition there would be ~ 25% added to the detector signal, the greater part of this coming from the ^{7}Be neutrinos; the desired sensitivity to the p-p neutrinos would then be less.

32709 (CONF-850507—13) **Calculated neutron-induced cross sections for /sup 63,65/Cu /sup 58,60/Ni, and ^{52}Cr from 1 to 20 MeV and comparisons with experiments.** Hetrick, D.M.; Fu, C.Y.; Larson, D.C. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011928.

From International conference on nuclear data for basic and applied science; Santa Fe, NM, USA (13 May 1985).

Nuclear model codes were used to compute cross sections for neutron-induced reactions on /sup 63,65/Cu, /sup 58,60/Ni, and ^{52}Cr for incident energies from 1 to 20 MeV. The input parameters for the model codes determined through analysis of experimental data in this energy region. The models used, the input data, the resulting calculations, and comparisons with measured data are discussed. 15 refs.

32710 (GANIL-P—84-13) **Heavy fragments emission in the ^{84}Kr on ^{12}C reaction at 35 MeV/nucleon.** Mittig, W.; Cunsolo, A.; Foti, A.; Wieleczko, J.P.; Auger, F.; Berthier, B.; Pascaud, J.M.; Quebert, J.; Plagnol, E. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)). 1984. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751340.

Heavy residues of collisions of ^{84}Kr + ^{12}C at 35 MeV/amu were measured using time of flight ΔE-E telescopes. An important part of the total cross-section leads to events that have all the characteristics of an equilibrated composite system decaying by heavy fragments emission. The experimental yields are well reproduced using a statistical model.

In Annual report June 1984. [Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Center].

Despite extensive charged-particle studies the level structure of Yttrium 89 above 3 MeV was essentially unknown and uncertainties remained at lower excitations. In the study total cross section measurements were made at incident neutron energies of 0,5 x 0,1 to 4,2 MeV. Differential neutron scattering measurements were made at 50 keV intervals from 1,5 to 4,0 MeV. Differential inelastic cross sections were determined concurrently with the elastic scattering cross sections. Inelastic gamma ray measurements were also made.

32713 **LBL/UCSB Ge-76 double beta decay experiment - first results.** Goulding, F.S.; Cork, C.P. (Univ. of California, Berkeley). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-32**: 463-470(Feb 1985). Contract AC03-76SF00098.

Preliminary results of an experimental effort to detect the neutrinoless double-beta decay of Ge-76 are presented. The experimental apparatus, including eight 150-cu cm Ge detectors (total Ge mass 6.4 kg), 6-inch-thick NaI Compton shielding, OFHC copper enclosures and mountings, and electronics permitting unattended operation over long periods, is described in detail. The physical principles involved are reviewed; and the performance of the system in an above-ground laboratory using only one or four detectors is characterized and illustrated with graphs. A half-life limit of 4 x 10 to the 22nd yr at confidence level 68 percent is established for the double-beta decay on the basis of 1620 h of operation. The background in the range of interest (around 2.041 MeV) is estimated as 5 x 10 to the -6th counts/h keV cu cm (comparable to the 2 x 10 to the -6th counts/h keV cu cm typically reported for deep-underground facilities) and attributed mainly to prompt gamma rays from cosmic-ray-induced neutrons.

32714 **Analyzing power for the inelastic continuum with 200 MeV protons.** Lisantti, J.; Tinsley, J.R.; McDaniels, D.K. (Oregon Univ., Eugene (USA)); Drake, D.M. (Los Alamos National Lab., NM (USA)); Bergqvist, I. (Lund Univ. (Sweden)); Swenson, L.W. (Oregon State Univ., Corvallis (USA)); Bertrand, F.E.; Gross, E.E.; Horen, D.J.; Sjoreen, T.P. (Oak Ridge National Lab., TN (USA)). *Physics Letters, [Section] B;* **147**: No. 1-3, 23-26(1 Nov 1984).

Inelastic proton scattering from targets of ^{60}Ni, ^{90}Zr, and ^{208}Pb has been studied using 200-MeV polarized and unpolarized protons. The behavior with angle of a narrow region at the peak of the continuum underneath the giant resonance spectra follows that expected for free nucleon-nucleon scattering, modified by an energy shift dependent on target mass. Analyzing power results support the hypothesis that single-step quasifree scattering represents a significant fraction of the overall inelastic scattering for the excitation region near the proposed quasifree peak, but indicate that other processes start to dominate above this excitation region.

32715 **High spin spectrometry of light zirconium isotopes sup(82-90)Zr.** Lister, C.J.; Varley, B.J. (Manchester Univ. (UK). Dept. of Physics); Price, H.G. (Daresbury Lab. (UK)); Warburton, E.K.; Olness, J.W. (Brookhaven National Lab., Upton, NY (USA)); Becker, J.A. (Lawrence Livermore National Lab., CA (USA)). pp 39-49 of Proceedings of the International symposium on in-beam nuclear spectroscopy held at Debrecen, Hungary, 14-18 May 1984. Dombradi, Zs.; Fenyes, T. (eds.). Budapest, Hungary; Akademiai Kiado (1984). (CONF-840530—).

From International symposium on in-beam nuclear spectroscopy; Debrecen, Hungary (14 May 1984).

Extensive spectroscopic studies were made on high spin states in the light zirconium isotopes sup(82-90)Zr. Measurements include $\sigma(E)$, W(theta), P(90), Γ via RDM and DSAM, γ-γ-Γ, n-γ-γ, n-n-γ coincidences and investigation of βsup(+) decay from odd-odd Nb nuclei. Spherical and deformed shell model calculations were performed to facilitate the interpretation of these data. The competition between collective and intrinsic excitation was examined both as a function of neutron number and total angular momentum.

32716 **(CBPF-NF—020/83) States in ^{118}Sn from ^{117}Sn(d,p) ^{118}Sn at 12 MeV.** Frota-Pessoa, E. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 33p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701448.

^{118}Sn energy levels up to = 5.2 MeV excitation energy are studied in the reaction ^{117}Sn (d,p) ^{118}Sn. Deuterons had a bombarding energy of 12 MeV. The protons were analyzed by a magnetic spectrograph. The detector was nuclear emulsion and the resolution in energy about 10 KeV. The distorted-wave analysis was used to determine l values and spectroscopic strengths. Centers of gravity and the sums of reduced spectroscopic factors are presented for the levels when it was possible to determine the S' value. 66 levels of excitation energy were found which did not appear in previous ^{117}Sn (d,p) reactions. 40 levels were not found previously in any reaction giving ^{118}Sn. The results are compared with the known ones.

32717 **(CONF-850507—15) Fast-neutron interaction with niobium.** Smith, A.B.; Guenther, P.T.; Poenitz, W.P.; Smith, D.L.; Whalen, J.F.; Howerton, R.J. (Argonne National Lab., IL (USA); Lawrence Livermore National Lab., CA (USA)). 1985. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011471.

From International conference on nuclear data for basic and applied science; Santa Fe, NM, USA (13 May 1985).

Results of a comprehensive study of the interaction of fast neutrons with niobium are presented, including measurement and interpretation of neutron total, differential-scattering and radiative-capture cross sections. The experimental results are interpreted in the context of the optical-statistical model, with attention to the Fermi-surface anomaly. Experimental results, physical interpretations and rigorous statistical methods are used to provide a comprehensive evaluated nuclear data file suitable for use in a wide range of applied neutronic calculations.

32718 **(FEI—1385) Measurement and analysis of neutron emission spectrum under niobium nucleus bombardment by 14 MeV neutrons.** Lychagin, A.A.; Vinogradov, V.A.; Grudzevich, O.T.; Devkin, B.V.; Kotel'nikova, G.V.; Plyaskin, V.I.; Sal'nikov, O.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1983. 16p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701025.

Spectra of inelastically scattered neutrons on niobium nuclei at 30, 45, 60, 75, 90, 120 and 135 deg angles were measured for 14.3 MeV neutron initial energy. The integral energy spectrum of neutron emission was obtained. Theoretical analysis of obtained spectrum was made. Spectra of the first and the second neutrons were separated out of the total spectrum and the (n, 2n) reaction cross-section was calculated.

We compare the results of our hydrodynamic calculations with recent ^{93}Nb+^{93}Nb (Esub(lab)=400 MeV/n) data from the GSI-LBL Plastic Ball Group and with the Ar+Pb (Esub(lab)=800 MeV/n) data from the streamer chamber measurements by the GSI-LBL Heidelberg collaboration. (orig./HSI).

32720 (INIS-mf—9299, pp 53-62) **Multifragment production in high-energy proton nucleus collisions.** Gross, D.H.E. (Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.). Bereich Kern- und Strahlenphysik; Freie Univ. Berlin (Germany, F.R.). Fachbereich Physik). 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780947. (CONF-840166—).

From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

The decay of the target nucleus after bombardment with protons with energy above several GeV is calculated in the frame of a statistical model. The phase-space of decay channels (partition sum) is calculated realistically by taking the finiteness of the system and the strong Coulomb interaction between the fragments into account. Under such conditions the system behaves quite differently from neutral macro systems near the gas-liquid phase transition. The mass-yield of the fragments is U-shaped and consistent with experiments in the entire fragment-mass range. Characteristic 'phase transitions' are found. (orig.).

32721 (INIS-mf—9299, pp 64-66) **Short-range and long-range correlations in the p-Xe scattering at 200 GeV.** Derado, I. (Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.)). 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780947. (CONF-840166—).

From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

We observed short-range correlations, the strength of which depends on the number of independent interactions inside the nucleus. We observed long-range correlations in a hadron nucleus interaction for the first time. The long-range correlations, as opposed to short-range correlations, increase with the number of interactions of the projectile inside the nucleus. (orig./HSI).

32730 **(JINR—E-1-83-850) Stopping and energy deposition of hadrons in target nuclei.** Strugalski, Z. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1983. 10p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701026.

In an analysis of pion-xenon nucleus collisions at 2.34-9 GeV/c momentum events are identified in which incident pions were completely stopped and deposited their energy in target nucleus. Probability of appearance of such "stopped" events among any-type pion-xenon collision events depends on the incident pion momentum and is: approximately 0.15 at 2.34 GeV/c, approximately 0.02 at 3.5 GeV/c, and approximately 0 at higher momenta. Formula expressing probability of appearance of the "stopped" events is derived. Range-energy relation in nuclear matter for pions and protons is given.

32731 **(JINR—R-7-84-68) Decay of highly excited compound nuclei: a statistical approach.** Il'inov, A.S.; Cherepanov, E.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions). 1984. 23p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701021.

In the framework of a statistical method the experimental data on the decay of moderately excited ($10 < E^{*}$ 200 MeV) nuclei produced in heavy ion fusion reactions are analysed. It is shown that taking into account the damping of shell effects with increasing excitation energy allows one to describe a large amount of data at $E^{*}<200$ MeV energies. The statistical properties, macroscopic "temperature" effects, new mechanisms of nuclear decay at high excitation energies ($E^{*}>200$ MeV) and the possibilities of extending such investigations on complete-fusion reactions induced by low-energy (<20 MeV/nucleon) heavy ions (Asub(i) approximately 50-100) are examined.

In Annual report June 1984. [Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Center].

Elemental indium is 96% ^{115}In which is one gsub(9/2) proton short of the closed shell at N=50. The neutron measurements in this study were confined to the total and elastic scattering cross sections. With its superior resolution and non-selective population of low-lying levels it has been possible to identify at least 35 levels up to an excitation of 2442 keV. Neutron inelastic scattering cross sections for individual states in ^{115}In were obtained from (n,n^{1},γ) measurements. The study has extended the knowledge of the decay scheme and provided a basis for an optical model which quantitatively describes the observations.

32733 **(UCRL—92666) Measurements and calculations of neutron scattering angular distributions over a wide mass and energy range.** Hansen, L.F. (Lawrence Livermore National Lab., CA (USA)). May 1985. Contract W-7405-ENG-48. 13p. (CONF-850507—19). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012912.

From International conference on nuclear data for basic and applied science; Santa Fe, NM, USA (13 May 1985).

Neutron elastic and inelastic differential cross sections for targets between ^{9}Be and ^{239}Pu at energies, $E > 14$ MeV have been measured using the Livermore and Ohio University neutron time-of-flight facilities. We review here the data and the analyses based on two local microscopic optical potentials: that of Jeukenne, Lejeune and Mahaux, and that of Brieva and Rook. The results are also compared with calculations using global potentials. Coupled channel formalism has been used in the analysis of targets with strong deformations, such as Be, C, Ta, and actinides. The value of the microscopic optical potentials as a tool to predict elastic and inelastic neutron cross sections over a wide mass and energy range is discussed. The need for neutron measurements up to higher energies and their analysis in conjunction with (p,p) and charge exchange (p,n) data is addressed. 17 refs.

32735 (GSI—85-2-Prepr.) Feeding times of high spin states in sup(152,154)Dy: Probes of nuclear structure above the yrast line. Azgui, F.; Emling, H.; Grosse, E.; Michel, C.; Simon, R.S.; Spreng, W.; Wollersheim, H.J.; Khoo, T.L.; Chowdhury, P.; Frekers, D. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Jan 1985. 30p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85751616.

Measurements of feeding times of high spin yrast states up to spin 30 (h/2π) in ^{154}Dy and 36 (h/2π) in ^{152}Dy were utilized to obtain information about possible spin dependent shape changes. The reactions ^{25}Mg (^{134}Xe, 5n), ^{124}Sn (^{34}S, 4n) and ^{25}Mg (^{132}Xe, 5n), ^{122}Sn (^{34}S, 4n) were used to populate the high spin states in ^{154}Dy and ^{152}Dy, respectively. Feeding times as well as lifetimes were determined with the recoil distance technique. In ^{152}Dy only long feeding times ($>=10$ ps) could be identified, indicating that the aligned-particle yrast states are fed through configurations of similar character, with little direct population from collective cascades in the continuum region. In ^{154}Dy discrete states with $I<=30$ (h/2π) have lifetimes which are characteristically collective, whereas the preyrast cascades exhibit both fast (< or approx.1 ps) and slow (proportional10 ps) feeding components. The latter imply a change with increasing spin from collective to aligned-particle character, probably associated with a prolate to oblate shape transition.

32737 (INIS-mf—9634) Investigation of the rotational nuclei ^{167}, ^{168}Hf and ^{170}, ^{171}W and the shell-model nucleus ^{26}Mg. Arciszewski, H.F.R. (Rijksuniversiteit Utrecht (Netherlands)). 6 Jun 1984. 102p. NTIS (US Sales Only), PC A06/MF A01. File Number DE85780926.

Includes Dutch summary; 64 refs.; 24 figs.; 9 tables.

Two gamma-gamma coincidence experiments on neighbouring nuclei that exhibit the backbending phenomenon are described. The first experiment performed with the cyclotron of the KVI at Groningen is an investigation of ^{167}Hf and ^{168}Hf, whereas in the second experiment, performed at the cyclotron facility of Louvain University, high spin states are studied and compared with predictions of the cranked shell model. A new method for the correction of the large background of Compton-scattered events is described. Apart from this, an investigation of the single particle (d,p) transfer reaction at ^{26}Mg has been performed with the van de Graaff tandem accelerator at 14 MeV. Specroscopic factors are presented for many levels up to an excitation energy of 8 MeV. Several new spin assignments could be made.

32738 Spectroscopy of the highest-spin states. Stephens, F. (Lawrence Berkeley Lab., CA (USA)). pp 205-216 of Proceedings of the International symposium on in-beam nuclear spectroscopy held at Debrecen, Hungary, 14-18 May 1984. Dombradi, Zs.; Fenyes, T. (eds.). Budapest, Hungary; Akademiai Kiado (1984). (CONF-840530—).

From International symposium on in-beam nuclear spectroscopy; Debrecen, Hungary (14 May 1984).

The reasons for constructing large arrays of Compton-suppressed germanium detectors are discussed and a description is given of the Berkeley array, presently under construction. Preliminary results from the Berkeley system are given for the nucleus sup(156)Er. A transition is seen, around spin 30, from collective rotational behaviour to non-collective single-particle behaviour. The transition depends on configuration, as well as spin.

32739 Competing nuclear structures in sup(182-188)Hg. Ramayya, A.V.; Ma, W.C.; Hamilton, J.H.; Robinson, S.J.; Zhao, K. (Vanderbilt Univ., Nashville, TN (USA). Dept. of Physics); Cole, J.D.; Zganjar, E.F. (Louisiana State Univ., Baton Rouge (USA). Dept. of Physics); Spejewski, E.H. (Oak Ridge Associated Universities, Inc., TN (USA). UNISOR). pp 317-329 of Proceedings of the International symposium on in-beam nuclear spectroscopy held at Debrecen, Hungary, 14-18 May 1984. Dombradi, Zs.; Fenyes, T. (eds.). Budapest, Hungary; Akademiai Kiado (1984). (CONF-840530—).

From International symposium on in-beam nuclear spectroscopy; Debrecen, Hungary (14 May 1984).

Recent experimental results in sup(182-188)Hg are presented. The levels in sup(182)Hg are identified for the first time. Presently available theoretical interpretations are discussed. The results indicate that there are multiple competing nuclear structures along the yrast line. It is interpreted that the gradual upbend of Isub(x) in the deformed band and the next super band are the result of aligning two hsub(9/2) or isub(13/2) protons.

32740 (GANIL-P—84-09) Fission-fragment kinetic-energy distributions from a two-dimensional Fokker-Planck equation. Scheuter, F.; Gregoire, C.; Hofmann, H.; Nix, J.R. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)). Sep 1984. 12p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751339.

We calculate the fission-fragment kinetic-energy distribution for the compound nucleus ^{213}At by simultaneously taking into account spreading in a stretching degree of freedom and fluctuations in a fission degree of freedom. This is done in terms of an approximate solution of a two-dimensional Fokker-Planck equation obtained by propagating Gaussian bundles in momentum space. When compared as functions of nuclear temperature with experimental data, our calculated mean kinetic energies are in approximate agreement and our calculated variances are slightly too small.

32741 (GSI—85-3-Prepr.) Channel dependent sharing of the excitation energy in quasielastic reactions between ^{208}Pb + ^{86}Kr. Sohlbach, H.; Freiesleben, H.; Braun-Munzinger, P.; Kohlmeyer, B.; Marinescu, M.; Puehlhofer, F.; Schneider, W.F.W.; Schuell, D. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Jan 1985. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751649.

Energy spectra of quasielastic reaction products formed in ^{86}Kr bombardment of ^{208}Pb at various beam energies show broad structures that are shown to originate from sequential neutron emission following one or few nucleon transfer. A Monte Carlo simulation of the decay process is used to obtain information on the excitation energy sharing for primary fragments. Strong evidence is found for a channel dependent sharing of the excitation energy among the reaction partners.

32742 (INIS-mf—9238) **Inclusive and exclusive cross sections for the ^{3}He breakup on ^{197}Au. A test case for the DWBA approach in the post-formulation.** Kleinfeller, J. (Bonn Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet). 20 Dec 1983. 98p. (In German). NTIS (US Sales Only), PC A03/MF A01. File Number DE85780886.

The ^{3}He breakup on the ^{197}Au target for two projectile energies E = 24.8 MeV and E = 33.3 MeV was studied. Both incident energies lie near the Coulomb barrier of the target (24.1 MeV). The inclusive proton and deuteron spectra were measured in an angular range of 20°-155°. In the same angular range systematically (dp) and (pp) angular correlations were taken up. The contributions from the elastic and inelastic ^{3}He breakup in the inclusive proton and deuteron spectra were, as far as they could be separated, were compared with the prediction of a DWBA-description of the projectile breakup. The comparison extends to the p and d angular distribution of the inclusive breakup cross sections and the corresponding energy spectra, to the angular distributions of the elastic ^{3}He breakup into p and d, and to the energy dependence of this breakup channel. The reaction ^{197}Ausup(gs)(^{3}He,dp) ^{197}Ausup(gs) was kinematically completely determined by the (dp) coincident measurements, and can be compared in all angular correlations immediately with the predictions of the DWBA theory. The experimental data of the reaction ^{197}Au(^{3}He,2p) (^{197}Au + n)sup(*) with Esub(n)sup(cm) >= 0 were compared with the calculations of the DWBA approach in a semiclassical approximation. The results of the comparison show that the DWBA approach, which has been proved in the description of the deuteron breakup, describes also well the ^{3}He breakup into p and d. The semiclassical approach however yields less sufficient results. (orig./HSI).

32747 (IPNO-DRE—83-24) **Anomalies in the heavy Hg isotopes.** Vergnes, M.; Berrier-Ronsin, G.; Rotbard, G. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). 1983. 12p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751327.

The (p,t) reaction has been performed on natural Hg and separated ^{204}Hg, ^{202}Hg, ^{200}Hg, ^{198}Hg, ^{196}Hg targets, using a 25 MeV proton beam from the Orsay MP tandem accelerator and a split pole spectrometer. New excited 0^+ levels have been shown at 1410 keV in ^{202}Hg, 2250 in ^{200}Hg, 1775 in ^{198}Hg, 1450 and 1653 in ^{196}Hg and 1512 in ^{194}Hg. Striking discontinuities are observed in the energy behaviour of the 0_2^+ and in the cross sections of the 0_2^+ and 2_3^+ levels. The results are compared to IBM-2 calculations and to a recent microscopic calculation. It appears that the 0_2^+ in ^{200}Hg looks like an intruder state and that ^{200}Hg itself is anomalous as compared to the other Hg isotopes.

32748 (LYCEN—8343) **Study of the reaction α+Pb at 600 MeV.** Chamcham, K. (Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire; Lyon-1 Univ., 69 - Villeurbanne (France)). 1984. 92p. (In French). NTIS (US Sales Only), PC A05/MF A01. File Number DE85751299.

The α + Pb experiment at 600 MeV was realised at the Laboratoire National Saturne to search the Mach cone - Shock wave phenomenon in the nuclear matter. The light particles p, d, t, ^{3}He and ^{4}He were detected by surface barrier detectors. Inclusive measurements and angular correlations between two particles were realised. The inclusive spectras were analysed by the evaporation model. The contribution of the evaporative processes in the experimental angular distribution has been calculated by a Monte-Carlo simulation. The residual angular distribution manifests a peak around 45°, in agreement with theoretical predictions.

From International conference on theoretical approaches to heavy ion reaction mechanisms; Paris, France (14 May 1984).

A microscopic description based on the density - dependent Hartree-Fock-Bogolyubov approach with several kinds of constraints is used to extract the characteristic features of the collective dynamics of the fission process at low energy. The dynamical behaviour of the nucleus beyond the second saddle point and a mechanism for scission are deduced. They are analyzed in the framework of a quantum-mechanical treatment of collective dynamics taking into account the variations of the collective inertia.

32750 (FEI—1404) **Parameters of the multilevel analysis of the Pu-239 cross sections in resonance region.** Kolesov, V.V.; Luk'yanov, A.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1983. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701018.

On the basis of the program of joint multilevel analysis of total cross section and fission cross section, which has been previously developed in details and tested, a coordinated set of resonance parameters of formalism of S-matrix for Pu-239, reproducing data on energy dependence of the cross sections up to the energy 530 eV, is obtained. Calculation results according to parameters of the average cross sections in separate energy ranges and their comparison with the known evaluations are also given.

32753 **Anomalous positron peaks from supercritical collision systems.** Cowan, T.; Backe, H.; Begemann, M.; Bethge, K.; Bokemeyer, H.; Folger, H.; Greenberg, J.S.; Grein, H.; Gruppe, A.; Kido, Y.; Kluever, M.; Schwalm, D.; Schweppe, J.; Stiebing, K.E.; Trautmann, N.; Vincent, P. (Gesellschaft fuer Schwerionenforschung, D-6100 Darmstadt, Federal Republic of Germany; A. W. Wright Nuclear Structure Laboratory, Yale University, New Haven, Connecticut 06511; University of Frankfurt, D-6000 Frankfurt am Main, Federal Republic of Germany; University of Heidelberg,). *Physical Review Letters;* **54**: No. 16, 1761-1764(22 Apr 1985). Contract AC02-76ER03074.

Narrow positron peaks are observed in five supercritical collision systems with combined nuclear charge 180< or =Z/sub u/ < or =188. The peaks do not originate from nuclear internal pair conversion and their production appears to occur in a narrow projectile energy interval near the Coulomb barrier. The line shapes are consistent with emission by a source moving with the c.m. velocity. Particularly notable is an apparent independence of the peak energies on Z/sub u/. These observations are discussed in the context of the spontaneous decay of the QED vacuum and other new potential sources of line positron spectra.

32754 (CEA-CONF—7330) **Electrons and photons: a probe for short distance study of nuclei.** Gerard, A. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). 1983. 14p. (In French). (CONF-8309242—2). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751331.

From Meeting of the French Society of Physics; Grenobel, France (19 Sep 1983).

Study of nuclear interactions using electron and photon beams between 100 and 700 MeV energy has shown the limitations of the mean field theory, and given unambiguous evidence for meson exchange currents and Δ resonance propagation. Continuing the investigation at higher energies (1-3 GeV) would permit to deepen further these discoveries and probe the short and very short range parts of nuclear interactions, thus specifying the role of quarks in the nuclear dynamics.

32755 (CEA-CONF—7380) **Some aspects of heavy ion macrophysics.** Ngo, C. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). Jul 1984. 50p. (CONF-840708—2; DPh-N-S—2181). NTIS (US Sales Only), PC A03/MF A01. File Number DE85751302.

From International school of heavy ion physics - frontiers in nuclear dynamics course; Erice, Trapani, Italy (16 Jul 1984).

In these notes we review, in a schematic way, some aspect of the physics with heavy ions. In the first lecture we review how is possible to describe the dissipative phenomena observed above the Coulomb barrier, up to 10-15 MeV/u, using transport theories. The second lecture is devoted to the question of fusion and the appearance of a new mechanism: fast fission. It is shown that one can now have a global understanding of these phenomena within single picture. The third lecture presents, in a simplified way, some results obtained recently with heavy ions in the range of 30-50 MeV/u at GANIL and SARA.

32756 (CONF-850507—7) **Pairing correction of particle-hole state densities for two kinds of Fermions.** Fu, C.Y. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011549.

From International conference on nuclear data for basic and applied science; Santa Fe, NM, USA (13 May 1985).

Pairing corrections in particle-hole (exciton) state-density formulas used in precompound nuclear reaction theories are, strictly speaking, dependent on the nuclear excitation energy U and the exciton number n. A general formula for (U,n)-dependent pairing corrections has been derived in an earlier paper for exciton state-density formulas for one kind of Fermion. In the present paper, a similar derivation is made for two kinds of Fermions. It is shown that the constant-pairing-energy correction used in standard level-density formulas, such as U_0 in Gilbert and Cameron, is a limiting case of the present general (U,n)-dependent results.

32757 (GSI—84-66-Prepr.) **Dynamics of the nuclear disassembly in a field-theoretical model at finite entropies.** Knoll, J.; Strack, B. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Oct 1984. 10p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85780957.

The expansion phase of a hot nuclear system as created in an energetic heavy-ion collision is calculated and discussed by a self-consistent field-theoretical model. Dynamical instabilities arising during the expansion from strong fluctuations of the one-body density are included explicitely. First multiplicity distributions and mass spectra resulting from a series of numerical runs in a 2+1 dimensional model world are presented. The dependence of break-up dynamics both on the properties of the binding force and possible correlations in the initially compressed hot state are discussed.

32758 (GSI—84-69-Prepr.) **Random-walk simulation of selected aspects of dissipative collisions.** Toeke, J.; Gobbi, A.; Matulewicz, T. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Nov 1984. 43p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85751125.

Internuclear thermal equilibrium effects and shell structure effects in dissipative collisions are studied numerically within the framework of the model of stochastic exchanges by applying the random-walk technique. Effective blocking of the drift through the mass flux induced by the temperature difference, while leaving the variances of the mass distributions unaltered is found possible, provided an internuclear potential barrier is present. Presence of the shell structure is found to lead to characteristic correlations between the consecutive exchanges. Experimental evidence for the predicted effects is discussed.

32759 (GSI—84-70-Prepr.) **Distorted-wave Born-approximation theory of heavy-ion induced projectile break-up reactions.** Shyam, R.; Nagarajan, M.A. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Nov 1984. 46p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85751126.

A distorted-wave Born-approximation (DWBA) formalism is developed to describe the elastic and inelastic break-up of the projectile in the heavy ion induced reactions. Using a local momentum approximation and the surface localization property of these reactions expressions for the DWBA transition amplitude are derived. One of the attractive features of the present formulation is the fact that the readial integrals involved in it are the same as those contained in the transition amplitude evaluated with a zero range approximation. The validity of the approximations used in our derivations has been tested and it is shown that these approximations are well fulfilled.

32760 (INIS-mf—9299, pp 129-135) **New quantum chromodynamical viewpoint in nuclear structure.** Bleuler, K. (Bonn Univ. (Germany, F.R.). Inst. fuer Theoretische Kernphysik). 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780947. (CONF-840166—).

From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

The scope of this short contribution is to show that quark theoretical viewpoints do not only lead to a deeper understanding of the conventional theory but that they open at the same time a new and to some extent more direct way for the understanding of nuclear properties. (orig./HSI).

32761 (INIS-mf—9299, pp 23-33) **Towards the nuclear matter equation of state.** Harris, J.W.; Stock, R.; Bock, R.; Brockmann, R.; Sandoval, A.; Stroebele, H. From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

We have shown that the fireball model as well as the cascade model describe the data reasonably, each model with some deficiencies. Whereas the spectra agree, the density with which every model is dealing does not. In the cascade model densities of 3-4 rho$_0$ (rho$_0$=.17 fm^3) are obtained, whereas in the thermodynamical model only densities of 1.5 rho$_0$ are reached. (orig./HSI).

32766 (INIS-mf—9299, pp 95-111) **Coherent photon radiation from nuclei as a probe of impact parameters and nucleon velocity distributions in ultrarelativistic nuclear collisions.** Bjorken, J.D.; McLerran, L. (Fermi National Accelerator Lab., Batavia, IL (USA). Theory Group). 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780947. (CONF-840166—).

From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

Photons which are coherently produced when nucleons are accelerated during the collision of ultra-relativistic nuclei are studied as probes of the impact parameter of the collision and of the rapidity distribution of the nucleons. (orig.).

32767 (INIS-mf—9299, pp 112-114) **Detonation waves and quark matter formation in ultrarelativistic heavy ion reactions.** Csernai, L.P. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). 1984. NTIS (US Sales Only), PC A10/MF A01. File Number DE85780947. (CONF-840166—).

From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

Detailed studies of detonation and deflagration waves in quark-gluon plasma have discussed the plasma of vanishing baryon density and chemical potential nsub(B)=μsub(B)=0, which is assumed to be formed in the mid rapidity range of ultrarelativistic heavy ion reactions. According to the recent lattice QCD calculations of Hasenfratz et al., including both quarks and gluons for such zero baryon charge plasma, phase transition may occur only if the quark masses are larger than one GeV. Hence at the presently expected quark masses no phase transition can be present in the mid rapidity region. Some of the simpler calculations show this feature for nsub(B)=μsub(B)=0, but for nonzero baryon charge density a first order phase transition is predicted. Thus, the signatures of the phase transition to quark-gluon-plasma can be studied mainly or even exclusively in the fragmentation region. (orig./HSI).

From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

3+1 dimensional calculations of the energy density attainable in the proposed CERN/BNL experiments are presented. The restriction to light beams (^{16}O) seems to impose severe limits to the chance of forming quark matter in these experiments. Collisions of heavy nuclei (e.g. Pb+Pb) would provide higher energy densities at lower bombarding energies. (orig.).

From 12. international workshop on gross properties of nuclei and nuclear excitations; Hirschegg, Austria (16 Jan 1984).

In order to characterize the reaction mechanism we take the linear momentum transferred from the projectile to the target. This quantity is accessible by the measurement of the angle and velocities of the fission fragments. By the use of heavy targets such as Th nearly all reactions terminate by fission and a general view of the occurring mechanisms can be obtained. On the other hand, if lighter target nuclei are used whereby fission is less probable, only a selected range of impact parameters leads to fission. These two aspects mark the structure of my talk: In the first part, based on the measurements on Th, a classification of the reaction mechanisms is proposed, and in the second part, data on lighter nuclei are discussed whereby high transferred momenta are selected. These two parts are represented by two proposals; the first experimental series is finished and the second one has just started. (orig.).

With 57 refs.

Lie-algebraic techniques for the group action on manifolds given as a direct product of coset spaces and group manifolds are developed. The microscopic realisation of the Mass Quadrupole Collective Model (MQC) in the S0(3)xSO(n) and GLsub(+)(3, R)xSO(n) schemes is studied. The problem of the separation of the kinetic energy and the velocity field into a collective and an intrinsic part is analyzed. Different coordinate schemes in phase space for the U(n)-invariant collective motion and the U(3) dynamical group are introduced. In the GL(3,C)xU(n) scheme, the invariant volume element in the new coordinates and a completely orthonormal basis is constructed. (orig.).

Includes Dutch summary; 43 refs.; 8 figs.; 11 tabs.

The programme RITSSCHIL is a FORTRAN77 computer code for large spectroscopic calculations in the microscopic nuclear shell model. It is suitable for all tensorial shell-model operators, such as hamiltonians and operators for electromagnetic transitions, (many-)particle transfer, beta decay, etc. Starting from matrix elements of standard operators in single shells RITSSCHIL calulates the matrix elements of the physical operators in a multishell basis. RITSSCHIL can treat a large variety of operators (e.g. for many-particle transfer) and it is very flexible, fast and uses little space. The essential features of the theory behind the formalism of programme RITSSCHIL are the use of second quantization and the representation of all states and operators in terms of irreducible spherical tensors. The approach is applied to heavy nuclei with 126 neutrons. Moreover it is applied in a rather unconventional way to very light nuclei (He, Li).

32780 (IPNO-DRE—83-10) **Fusion and competing reactions in central collisions at large excitation energies.** Lefort, M. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). 1983. 23p. (CONF-830340—4). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751323.

From International conference on heavy-ion physics and nuclear physics; Catania, Italy (21 Mar 1983).

Two aspects of fusion reactions resulting from central collisions of complex nuclei are discussed. 1. The distinction between a mononuclear nucleus which undergoes fission and a true fully equilibrated spherical compound nucleus. The "extra push" model and the "dynamical" fission for l-waves close to l3sub(f)=O (Rotating Liquid Drop). 2. Large energy deposits and thermalization in Central collisions when the relative kinetic energy is increased in the region 20-80 MeV.A. What are the problems raised for the decay of such very excited high-spin nuclei.

32781 **(ISN—83-65) Four-body Yakubovsky differential equations for identical particles.** Merkuriev, S.P.; Yakovlev, S.L. (Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires). Dec 1983. 25p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751292.

The differential equations for Yakubovsky components of the four-body wavefunctions are derived. An asymptotic form of these components is described. A symmetrized form of the Yakubovsky differential equations for four identical particles is given and its angular analysis is performed. Bound state calculations are presented for various potentials.

32782 **(ISN—84-12) Approach of chaos in deformed nuclei.** Carbonell, J.; Brut, F.; Arvieu, R.; Touchard, J. (Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires). Mar 1984. 10p. (CONF-840395—8). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751334.

From Workshop on semi-classical methods in nuclear physics; Grenoble, France (5 Mar 1984).

The phase space of the trajectories of one neutron in a deformed single particle potential is sketched for A=16. The region of occurrence of the chaotic trajectories is found. The energy action surface is plotted for the simplest topology. Semi-classical energies are derived.

32783 **(ISN—84-13) Nuclear elasticity approach to giant resonances.** Jang, S. (Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires). Mar 1984. 12p. (CONF-840395—3). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751304.

From Workshop on semi-classical methods in nuclear physics; Grenoble, France (5 Mar 1984).

The fragmentation of the isoscalar giant monopole and quadrupole resonances in deformed nuclei has been studied within the framework of the nuclear elasticity.

32784 **(ISN—84-14) General iteration scheme for the calculation of level densities, and results using a semiclassical approximation.** Blin, A.H.; Hiller, B.; Hasse, R.W.; Schuck, P. (Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires). Mar 1984. 10p. (CONF-840395—4). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751309.

From Workshop on semi-classical methods in nuclear physics; Grenoble, France (5 Mar 1984).

A general scheme is derived to calculate m-particle n-hole fermion level densities for any single particle Hamiltonian taking into account Pauli exclusion. This technique is applied to obtain level densities of the three dimensional isotropic Harmonic Oscillator semiclassically in the Thomas-Fermi approach.

32785 **(ISN—84-15) Semiclassical calculations of the imaginary part of the nucleon-nucleus optical potential.** Hasse, R.W.; Schuck, P. (Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires). Mar 1984. 9p. (CONF-840395—5). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751310.

From Workshop on semi-classical methods in nuclear physics; Grenoble, France (5 Mar 1984).

We calculate for finite nuclei the imaginary part of the nucleus-nucleon optical potential on and off shell by using the local Fermi gas approximation and a finite range two-body exchange force. Results are compared with those obtained by infinite nuclear matter calculations as well as using the local density or Glauber approximation.

32786 **(ISN—84-16) Semiclassical calculation of the nuclear response function at high momentum.** Stroth, U.; Hasse, R.W.; Schuck, P. (Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires). Mar 1984. 6p. (CONF-840395—6). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751311.

From Workshop on semi-classical methods in nuclear physics; Grenoble, France (5 Mar 1984).

We calculate the nuclear response function in a semiclassic fashion. It is shown, that the obtained results are for high momentum transfers $q>=2\ \mathrm{fm}^{-1}$ in a very good agreement with an exact calculation.

32787 **(ISN—84-17) Classical properties and semiclassical calculations in a spherical nuclear average potential.** Carbonell, J.; Brut, F.; Arvieu, R.; Touchard, J. (Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires). Mar 1984. 10p. (CONF-840395—7). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751312.

From Workshop on semi-classical methods in nuclear physics; Grenoble, France (5 Mar 1984).

We study the relation between the classical properties or an average nuclear potential and its spectral properties. We have drawn the energy-action surface of this potential and related its properties to the spectral ones in the framework of the EBK semiclassical method. We also describe a method allowing us to get the evolution of the spectrum with the mass number.

32788 **(ISN—84-20) Classical properties and semiclassical quantization of a spherical nuclear potential.** Carbonell, J.; Brut, F.; Arvieu, R.; Touchard, J. (Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires). Mar 1984. 45p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85751295.

The geometrical properties of the classical energy-action surface are studied for a nuclear Woods-Saxon-like spherical potential, in connection with the E.B.K. semiclassical method of quantization. Comparisons are made with other well known cases: the spherical harmonic oscillator and the spherical billiard. The shift of single particle energies from A = 208 to A = 16 is calculated by a simple method inspired by the Erhenfest adiabatic invariants. Semiclassical results are then compared with exact Schroedinger energies. It is seen that the most significant features of the single particle spectrum are explained by local properties of the energy action surface (curvature, slope) and by their evolution with the particle number.

32789 **(JINR—E-1-83-851) Energy- and A-dependences of the nucleon emission intensity in hadron-nucleus collisions.** Strugalski, Z. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1983. 8p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701022.

The intensity of nucleon emission in high energy hadron-nucleus collisions is considered. Energy- and A-dependences of the mean proton intensity, measured by the mean proton multiplicity, observed in experiments, can be reproduced simply by the mean thicknesses of target nuclei, expressed in protons per some fm^2, and by the total cross section for hadron-nucleon collisions. Formulas are derived and tested experimentally within incident hadron energy range from 2 up to 3500 GeV, and within taract nucleus mass numbers 12-206.

32790 **(JINR—R-2-84-78) Density and entropy of the pion excitations in the nuclear matter.** Bunatyan, G.G. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics). 1984. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701017.

The thermodynamical properties of the pion excitations in the isotopically symmetric nuclear matter are investigated. The expressions for the density and the entropy of the pion excitations are obtained, that are then transformed for the state of the system near by the pion field instability. The calculations have been fulfiled on the basis of the application of the quantum field theory methods in the many-body problem for nonzero temperature by means of the temperature Green functions. The obtained results give the dependence of the density and the entropy of the pion excitations on the temperature and density of the nuclear matter.

32791 (Juel—1960) **Validation of the intra-nuclear-cascade-evaporation model for particle production.** Filges, D.; Cloth, P.; Cierjacks, S.; Armstrong, T.W.; Hino, Y. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Kernphysik). Nov 1984. 194p. (KFK—3779). NTIS (US Sales Only), PC A09/MF A01. File Number DE85751639.

The intranuclear-cascade-evaporation model of HETC/KFA-1 has been used to predict the neutron production from nonelastic interactions of protons with several target materials: U, Pb, Ta, In, Nb, Fe, Al and C. These model predictions for a 590 MeV proton beam were compared with measurements of Cierjacks et al. made at the SIN cyclotron. In general the model predicts approximately the correct neutron production in the evaporation region, whereas in the high energy region (Esub(n) > 20 MeV) there are systematic discrepancies between measurement and model predictions, which tend to increase with increasing neutron energy and increasing emission angle.

32792 (LBL—19222) **Friction in nuclear dynamics.** Swiatecki, W.J. (Lawrence Berkeley Lab., CA (USA)). Mar 1985. Contract AC03-76SF00098. 36p. (CONF-850376—2). NTIS, PC A03/MF A01; GPO Dep. File Number DE85011984.

From Symposium on semiclassical descriptions of atomic and nuclear collisions; Copenhagen, Denmark (25 Mar 1985).

The problem of dissipation in nuclear dynamics is related to the breaking down of nuclear symmetries and the transition from ordered to chaotic nucleonic motions. In the two extreme idealizations of the perfectly Ordered Regime and the fully Chaotic Regime, the nucleus should behave as an elastic solid or an overdamped fluid, respectively. In the intermediate regime a complicated visco-elastic behaviour is expected. The discussion is illustrated by a simple estimate of the frequency of the giant quadrupole resonance in the Ordered Regime and by applications of the wall and window dissipation formulae in the Chaotic Regime. 51 refs.

32793 (LYCEN—8415) **Lorentz-Lorenz quenching for the Gamow-Teller sum rule.** Delorme, J.; Ericson, M.; Figureau, A. (Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire). Mar 1984. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751289.

We investigate the modification of the Gamow-Teller sum rule brought in by nucleonic excitations. The general trend of the data is well reproduced. The value of the force which mixes nucleonic and nuclear excitations is discussed.

32794 (NAC-AR—84-01, pp 172-173) **Report of the Van de Graaff Group: nuclear reactions and nuclear structure. Shell-model calculations in the s-d and f-p shells.** Richter, W.A.; Van der Merwe, M.G.; Froneman, S.; Naude, W.J. (Stellenbosch Univ. (South Africa)); Brown, B.A. (Michigan State Univ., East Lansing (USA). Cyclotron Lab.); Wildenthal, B.H. (Drexel Univ., Philadelphia, PA (USA)); Julies, R.E. (University of the Western Cape, Bellville (South Africa)). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE85780939.

Short note.

In Annual report June 1984. [Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Center].

32795 **Probing heavy ion collisions with bremsstrahlung.** Ko, C.M.; Bertsch, G.; Aichelin, J. (Joint Institute for Heavy Ion Research, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831). *Physical Review* [*Section*] *C: Nuclear Physics;* **31**: No. 6, 2324-2326(Jun 1985).

We calculate bremsstrahlung spectra for intermediate energy heavy ion collisions to see the sensitivity of photon cross sections to reaction dynamics. Modeling the collisions with the intranuclear cascade, we find a clear collective quadrupole bremsstrahlung signal only for heavier nuclei, A>40. Maximum sensitivity to dynamics is likely for photons in the range of 10—30 MeV. For higher energy photons or lighter nuclei, there is a large background coming from the incoherent dipole component of the bremsstrahlung.

32796 **Complete fusion and quasifission in reactions between heavy ions.** Back, B.B. (Chemistry Division, Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review* [*Section*] *C: Nuclear Physics;* **31**: No. 6, 2104-2112(Jun 1985). Contract W-31-109-ENG-38.

It is shown that fission anisotropies from reactions with projectiles lighter than A = 20 are well described by the standard theory, in which it is assumed that the distribution of K values (projection of total spin I onto the symmetry axis) is determined at the fission saddle point. Angular anisotropies of symmetric fragments from heavy ion reactions with projectiles heavier than A = 24 are, however, substantially larger than expected on the basis of this theory, an observation which recently led to the suggestion that the K values adjust adiabatically during the descent from saddle to scission such that the observed final K distributions reflect a thermal equilibrium at the scission point. The predictions of such scission point models are compared with the available experimental data and it is shown that they fail to reproduce the observed trends as a function of bombarding energy for most systems. It is concluded that the observed deviation from the saddle point theory can be explained as a dynamical inhibition of complete fusion with heavy projectiles. An analysis is carried out in which the fraction of the symmetric fragment cross section originating from the fission decay of completely fused compound nuclei can be estimated. The systematics of the inhibition to complete heavy ion fusion is discussed in the framework of the extra push model.

32797 **Signals longitudinal hydrodynamic expansion in ultra-relativistic nucleus-nucleus collisions.** Ruuskanen, P.V. (California Univ., Berkeley (USA). Div. of Nuclear Science; Jyvaeskylae Univ. (Finland). Dept. of Physics). *Physics Letters,* [*Section*] *B;* **147**: No. 6, 465-468(15 Nov 1984).

The effects of hydrodynamics in the ultra-relativistic collisions of heavy nuclei are studied by using the results of numerical integration of hydrodynamic equations for longitudinal expansion. It is found that hydrodynamics may profoundly change the shape of the rapidity distribution of energy, dE/dtheta. In order to establish the existence of the hydrodynamic stage, both the rapidity distributions of the net baryon number, dnsub(B)/dtheta, and energy, dE/dtheta, should be studied simultaneously as functions of the size of the colliding nuclei.

NTIS, PC A02/MF A01; GPO Dep. File Number DE85011426.

From International meeting on advances in nuclear engineering computational methods; Knoxville, TN, USA (9 Apr 1985).

A review of current methods and difficulties in Monte Carlo deep-penetration calculations is presented. Statistical uncertainty is discussed, and recent adjoint optimization of splitting, Russian roulette, and exponential transformation biasing is reviewed. Other aspects of the random walk and estimation processes are covered, including the relatively new DXANG angular biasing technique. Specific items summarized are albedo scattering, Monte Carlo coupling techniques with discrete ordinates and other methods, adjoint solutions, and multi-group Monte Carlo. The topic of code-generated biasing parameters is presented, including the creation of adjoint importance functions from forward calculations. Finally, current and future work in the area of computer learning and artificial intelligence is discussed in connection with Monte Carlo applications. 29 refs.

32799 (CONF-8505113—1) Calculation of heavy-ion tracks in liquid water. Hamm, R.N.; Turner, J.E.; Ritchie, R.H.; Wright, H.A. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 17p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012101.

From 33. annual scientific meeting of the Radiation Research Society; Los Angeles, CA, USA (5 May 1985).

Detailed Monte Carlo calculations are presented of proton and alpha-particle tracks in liquid water. The computations treat the interactions of the primary particle and all secondary electrons on a statistical, event-by-event basis to simulate the initial physical changes that accompany the passage of an ion through water. Our methods for obtaining the cross sections needed for such calculations are described. Inelastic scattering probabilities (inverse mean free paths) are derived from a complex dielectric response function constructed for liquid water, based on experimental and theoretical data. Examples of partial cross sections for ionization and excitation by protons are shown. The computation of electron transport and energy loss includes exchange, elastic scattering, and a scheme for the delocalization of energy shared collectively by a large number of electrons in the condensed medium. Several examples of calculated proton and alpha-particle tracks are presented and discussed. The meaning and significance of the concept of a "track core" is briefly addressed in the light of this work. The present paper treats only the initial, physical changes produced by radiation in water (in $\sim 10^{-15}$ sec in local regions of a track). The work described here is used in calculations that we have reported in other publications on the later chemical development of charged-particle tracks. 10 refs., 6 figs.

32800 (FEI—1445) Approximation of angular distributions for elastically scattered neutrons. Korobejnikov, V.V.; Korobejnikova, L.V.; Nikolaev, M.N.; Tsibulya, A.M. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1983. 20p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701013.

Different methods used for description of the elastically scatted neutron angular distribution probability density developed specially for appication in calculations by the Monte-Carlo method are analyzed. Description of the program, which prepares information on elastic scattering anisotropy parameters in the convenient form is presented. Estimation of the effect of inaccuracy in neutron angular distribution on spatial distribution is performed.

32801 (FEI—1474) Investigations of an ionizing radiation transport in a nitrogen-containing medium. Volkov, V.S.; Kremenetskij, A.K.; Pavlov, G.M.; Pizaeva, L.N. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1983. 21p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701014.

The spectra of neutron and photon leakage from the surface of spherical or cubic form containers filled with ammonium nitrate (NH_4NO_3) with ^{252}Cf radionuclide source located in the centre of containers are investigated. The experimental data are compared with the ROZ2 program calculation. The calculation of neutron and photon radiation spectra is performed in the 28-group approximation of energy dependence for neutrons in the 0.5-15 MeV range and 15-group approximation for photons in the R_5 approximation of the scattering indicatrix in the 0.5-10 MeV range. The calculation data are shown to exceed the experimental data as a whole up to three times as much in the 3.5-5.5 MeV range.

32802 (INIS-mf—9459) Elaboration of a nodal method to solve the steady state multigroup diffusion equation. Study and use of the multigroup diffusion code DAHRA. Halilou, A.; Lounici, A. (Centre des Sciences et Technologie Nucleaires (CSTN), Algiers (Algeria)). Jan 1981. 125p. (In French). NTIS (US Sales Only), PC A06/MF A01. File Number DE85701118.

The subject is divided in two parts: In the first part a nodal method has been worked out to solve the steady state multigroup diffusion equation. This method belongs to the same set of nodal methods currently used to calculate the exact fission powers and neutron fluxes in a very short computing time. It has been tested on two dimensional idealized reactors. The effective multiplication factor and the fission powers for each fuel element have been calculated. The second part consists in studying and mastering the multigroup diffusion code DAHRA - a reduced version of DIANE - a two dimensional code using finite difference method.

32803 (NEANDC(J)—111/A) Activities of Working Group on Atomic, Molecular and Nuclear Data for Medical Science. (Japanese Nuclear Data Committee, Tokai, Ibaraki). 1985. 133p. (In Japanese). (INDC(JPN)—97/G; JAERI-M—85-024). JAERI, Tokai-mura, Naka-gun, Ibaraki-ken 319-11, Japan. File Number TI85901538.

This is a report on the activities of the Working Group on Atomic, Molecular and Nuclear Data for Medical Science, Japanese Nuclear Data Committee in the fiscal years of 1982 and 1983. This report consists of (1) brief reviews on stopping powers of charged particles and electrons and related topics, and on problems to use these data for practical radiotherapy, (2) reports on the investigation of the present status of data activities in other countries, (3) references, and (4) future plans after 1984.

32804 (PB—85-172203) Neutron-induced reactions and secondary-ion mass spectrometry: complementary tools for depth profiling. Final report. Downing, G.; Fleming, R.; Simons, D.; Newbury, D. (National Bureau of Standards, Washington, DC (USA)). 1982. 4p. Pub. in Proceedings of Annual Conference of the Microbeam Analysis Society (17th), Washington, DC., August 9-13, 1982, p219-221.

The technique of neutron depth profiling is based upon inducing nuclear reactions by bombardment with low-energy neutrons. The nuclear reactions result in the emission of high-energy alpha particles or protons. The energy spectrum of the emitted particles is used to derive a depth distribution by transforming the energy loss into an equivalent depth by stopping-power calculations. Depth profiles of bismuth distributions in silicon and tin have been measured by both neutron depth profiling and secondary ion mass spectrometry. Information from both techniques can be used synergistically to aid in a full characterization of the depth distribution.

32805 (PUC-TN—06/83) Multiphoton absorption coefficients in solids: an universal curve. Brandi, H.S.; Araujo, C.B. de. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Apr 1983. 19p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701431.

An universal curve for the frequency dependence of the multiphoton absorption coefficient is proposed based on a 'non-perturbative' approach. Specific applications have been made to obtain two, three, four and five photons absorption coefficient in different materials. Properly scaling of the two photon absorption coefficient and the use of the universal curve yields results for the higher order absorption coefficients in good agreement with the experimental data.

32806 (PUC-TN—12/83) Non-linear absorption in solids. Brandi, H.S.; Jalbert, G.; Malta, O.L. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Jun 1983. 17p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701432.

Multiphoton transitions in direct-gap crystals are studied considering a 'non-perturbative' approach, similar to Keldysh approximation. A simple two parabolic band model in the effective mass approximation is considered, so that exact solutions associate to the full, crystal plus field, Hamiltonian may be approximated by Volkov wavefunctions. In this manner an S matrix is constructed which incorporates the electromagnetic field to all orders in an approximated way, leading to analytical solutions for the multiphoton transition rates. The use of the saddle point method and its limitations as well as the connection between multiphoton absorption and tunneling is discussed. It is shown that the Keldysh approach is fairly accurate as long as terms arising from the saddle point integration are consistently accounted.

32807 **(RAL—84-064) Profile refinement of powder diffraction patterns using the Voigt function.** David, W.I.F.; Matthewman, J.C. (Rutherford Appleton Lab., Chilton (UK)). Aug 1984. 14p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85700989.

The Voigt function has been incorporated as a peak-shape description into a program for the refinement of constant wavelength X-ray and neutron diffraction patterns. The results obtained for neutron diffraction indicate that the Voigt function describes the profile peak shape to high accuracy even in the presence of substantial line broadening from particle-size effects.

32808 **(RAL—84-077) Deconvolution of liquid structure data: the pulsed neutron source case.** Howells, W.S. (Rutherford Appleton Lab., Chilton (UK)). Aug 1984. 11p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85700990.

The moments method for deconvoluting experimental data from the resolution function, which has previously been investigated for reactor diffractometers, has been adapted and shown to be suitable for time-of-flight techniques as employed on pulsed neutron sources.

32809 **(SAND—85-0564C) Coupled electron-photon transport calculations using the method of discrete ordinates.** Lorence, L.J. Jr.; Nelson, W.E.; Morel, J.E. (Sandia National Labs., Albuquerque, NM (USA); Science and Engineering Associates, Inc., Albuquerque, NM (USA); Los Alamos National Lab., NM (USA)). 1985. Contract AC04-76DP00789. 6p. (CONF-850711—4). NTIS, PC A02/MF A01; GPO Dep. File Number DE85009444.

From 22. annual conference on nuclear and space radiation effects; Monterey, CA, USA (22 Jul 1985).

A new discrete-ordinates method for coupled electron-photon transport is presented and applied to space shielding calculations. It is found that the discrete-ordinates method is as accurate as the standard Monte Carlo method, but is much more efficient.

32810 **(ZfK—531) MCANG - a group data library of cumulative angular distributions of elastically scattered neutrons for Monte Carlo calculations.** Boehmer, B. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Jun 1984. 16p. (In German). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701015.

A code has been written for producing group data suited to take into account the center of mass anisotropy of elastic neutron scattering in Monte Carlo calculations. The format of the generated data library is described. Up to now variants of the library based on KEDAK2 and KEDAK3/ENDL78 have been produced. One of the libraries is listed in the appendix.

32811 **Scaling law for the contact-propagation regime of first-passage percolation.** Kerstein, A.R. (Sandia National Laboratories, Livermore, California 94550). *Physical Review [Section] B: Condensed Matter;* 31: No. 11, 7472-7474(1 Jun 1985).

We study first-passage percolation on a lattice with a fraction p$<$ or $\approx$p/sub c/ of bonds assigned zero time delay, the others having finite delays governed by the cumulative distribution F(x). This "contact-propagation" regime exhibits criticality analogous to the random superconducting network. We derive, and confirm numerically, a scaling law that relates the divergence of the first-passage velocity near the percolation threshold p/sub c/ to static percolation exponents and to F(x).

32812 **One-dimensional model for three-dimensional transport in a pipe.** Larsen, E.W. (University of Calfornia, Los Alamos National Laboratory, Los Alamos, NM 87544). *Transport Theory and Statistical Physics;* **13**: No. 3, 599-614(Jul 1984).

We use a mathematical method to derive a one-dimensional model for particle transport in a pipe with reflecting walls. For the case of an evacuated pipe with particular reflecting boundary conditions for the walls, our model reduces to results obtained previously by Prinja and Pomraning.

32813 **Albedo operators and H-equations for generalized kinetic models.** van der Mee, C.V.M. (Laboratory for Transport Theory and Mathematical Physics, Virginia Polytechnic Institute and State University, Blacksburg, Virginia 24061, U.S.A.). *Transport Theory and Statistical Physics;* **13**: No. 2, 341-510(Apr 1984). Contract AS05-80ER10711.

For abstract kinetic equations on a half-line the albedo operator which gives the initial value as a function of the half-range boundary data, is written in terms of operator-valued generalizations of Chandrasekhar's H-functions, for which coupled non-linear equations are derived. Applications are given to transfer of polarized light, neutron transport and strong evaporation of liquids.

32814 **Linear transport in nonhomogeneous media. IV.** Larsen, E.W. (University of California, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Transport Theory and Statistical Physics;* **13**: No. 2, 511-531(Apr 1984).

A set of continuum and discrete eigenfunctoins, derived previously for half-space transport problems with a scattering ratio that is a bilinear function of position, is examined. For a Hoelder continuous angular flux incident on the half-space, this engenfunction set is proved to be half-range complete and the expansion coefficient for the continuum eigenfunctions is proved to be a continuous function of the spectral variable ν. Also, equations for the exiting flux, which are derived using this eigenfunction set, are proved to possess a unique, analytic solution.

32815 **Completeness theories in transport theory.** Zweifel, P.F. (Laboratory for Transport Theory and Mathematical Physics, Virginia Polytechnic Institut and State University, Blacksburg, Virginia 24061, U.S.A.). *Transport Theory and Statistical Physics;* **13**: No. 1, 57-106(Jan 1984). Contract AS05-80ER10711.

The role of self-adjoint operators in transport equations is considered. (AIP)

32816 **Acceleration of anisotropic transport iterations.** Williams, M. (Department of Mathematics, Virginia Polytechnic Institute and State University, Blacksburg, Virginia 24061). *Transport Theory and Statistical Physics;* **13**: No. 1, 127-140(Jan 1984). Contract AS05-80ER10711.

Fourier methods are used to study the stability of the associated difference scheme of transport theory (AIP).

32817 **(AECL—8266) Progress report: Health Sciences Division, 1983 July 1-December 31.** (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Feb 1984. 139p. (PR-HS—16). NTIS (US Sales Only), PC A07/MF A01. File Number DE85701531.

This report summarizes programs in health physics, radiation biology, environmental sciences and biomedical research. Health physics research included work on neutron dosimetry, thermoluminescent dosimetry, measurements of γ- and β-sensitivity of MOSFET detectors, tritium monitoring, a stack effluent monitor, and other radiation instruments. Environmental research included studies of heated plumes, radiotracer studies of flow through rock fractures, radionuclide cycling by plants, stable cobalt in fish, long-term radiation protection objectives for radioactive waste disposal, and tritium in surface waters in the CRNL vicinity. Radiation biology research continued to be concerned with DNA damage from radiation and carcinogenic chemicals, and enzymatic repair processes which help protect cells from such damage. In biomedical research the experiment to measure the fraction of HT in volunteers that is converted to HTO in vivo is progressing satisfactorily.

32818 (AERE-R—11210) **Livermore phantom as a calibration standard in the assessment of plutonium in lungs.** Newton, D.; Wells, A.C.; Mizushita, S. (UKAEA Atomic Energy Research Establishment, Harwell. Environmental and Medical Sciences Div.). Jun 1984. 55p. HMSO, London, price Pound 6.00.

Five laboratories collaborated in assessing the validity of a phantom thorax, designed as a calibration standard for the determination of plutonium in lungs by counting of low-energy X rays. Counters were calibrated by reference to the response from eight men whose lungs contained sup(92m)Nb (emitting 15.8-17.7 keV X rays) in quantities which were known independently of X-ray counting, and the ensuing calibration factors were compared with those indicated by similar studies with the phantom. For the most common arrangement of counters, in which paired detectors view the anterior surfaces of the upper thorax, use of the phantom should on average give calibration factors correct to within 20 per cent or better, although for individual subjects errors approaching a factor of two are possible.

32819 (CONF-850506—4) **Microdosimetric spectra measurements of JANUS neutrons.** Marshall, I.R.; Williamson, F.S. (Argonne National Lab., IL (USA)). 1985. Contract W-31-109-ENG-38. 28p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012108.

From 9. symposium on microdosimetry; Toulouse, France (20 May 1985).

Neutron radiation from the JANUS reactor at Argonne National Laboratory is being used with increasing frequency for major biological experiments. The fast neutron spectrum has a Kerma-weighted mean energy of 0.8 MeV and low gamma-ray contamination. In 1984 the JANUS fission converter plate of highly enriched uranium was replaced by one made of low-enriched uranium. We recorded microdosimetric spectra at several different positions in the high-flux irradiation room of JANUS before the change of the converter plate. Each set of measurements consisted of spectra taken at three different site diameters (0.5, 1.0, and 5.0 μm) and in both "attenuator up" and "attenuator down" configurations. At two conventional dosimetry reference positions, two sets of measurements were recorded. At three biological reference positions, measurements simulating several biological irradiation conditions, were taken. The dose rate at each position was estimated and compared with dose rates obtained previously by conventional dosimetry. Comparison of the different measurements showed no major change in spectra as a function of position or irradiation condition. First results from similar sets of measurements recorded after the installment of the new converter plate indicate no major change in the spectra. 11 refs., 4 figs., 5 tabs.

32820 (GRS-F—139) **Reports on radiation protection R and D projects of the Federal Ministry of the Interior in the year 1983.** (Bundesministerium des Innern, Bonn (Germany, F.R.); Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Garching (Germany, F.R.)). Oct 1984. 594p. (In German). NTIS (US Sales Only), PC A25/MF A01. File Number DE85751618.

The volume presents separate reports set up by the contractors or donees for documentation of the progress achieved within the framework of the various projects. The reports inform about the project purpose, work performed, results obtained, and further activities and goals. The full-text reports are preceeded by four different lists showing the report titles arranged according to terms of the radiation protection thesaurus, to project packages, to project numbers, and to an alphabetical subject index.

32821 (INIS-mf—9650, pp 4-6) **Conceptional background of the new radiation protection standards.** Tschurlovits, M. Mar 1984. (In German). NTIS (US Sales Only), PC A02/MF A01. File Number DE85780945.

In Oevs-Communication 1984/I.

Relation between doses and effects are considered. Non-stochastic and stochastic effects are distinguished. The concepts dose equivalent, collective dose and dose commitment are outlined.

32822 (INIS-mf—9650, pp 1-3) **New method of checking the shielding of medical radiography rooms.** Karacson, P. Mar 1984. (In German). NTIS (US Sales Only), PC A02/MF A01. File Number DE85780945.

In Oevs-Communication 1984/I.

A method to detect leaks in a room shielding during the comissioning of rooms containing X-ray equipment is described.

32823 (INIS-mf—9650) **Oevs-Communication 1984/I.** (Oesterreichischer Verband fuer Strahlenschutz (OeVS), Vienna). Mar 1984. 11p. (In German). NTIS (US Sales Only), PC A02/MF A01. File Number DE85780945.

Items within the scope of EDB have been entered individually into the data base. (ACR)

32824 (LA-UR—85-1616) **Treatment planning with ion beams.** Foss, M.H. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 4p. (CONF-850504—54). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012661.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

Ions have higher linear energy transfer (LET) near the end of their range and lower LET away from the end of their range. Mixing radiations of different LET complicates treatment planning because radiation kills cells in two statistically independent ways. In some cases, cells are killed by a single-particle, which causes a linear decrease in log survival at low dosage. When the linear decrease is subtracted from the log survival curve, the remaining curve has zero slope at zero dosage. This curve is the log survival curve for cells that are killed only by two or more particles. These two mechanisms are statistically independent. To calculate survival, these two kinds of doses must be accumulated separately. The effect of each accumulated dosage must be read from its survival curve, and the logarithms of the two effects added to get the log survival. Treatment plans for doses of protons, He^3 ions, and He^4 ions suggest that these ions will be useful therapeutic modalities.

32825 (NAC-AR—84-01, pp 246) **Report of the Research Group. Radiation safety and regulatory aspects.** Meyer, B.R.; Dirkse, J.A.M.T.; Conrad, F.M.P. 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE85780939.

In Annual report June 1984. [Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Center].

Radiation from SPC1 was produced for the first time during the latter half of 1983. Interim safety measures were adopted for protection of personnel against ionizing radiation. A large number of NAC staff members were registered as radiation workers and the health physics organization was set into motion. A training course, for educating radiation workers, was prepared and presented.

32826 (NRL—1983/1) **Radiation dosimetry of computed tomography x-ray scanners. Principles and techniques of measurement.** Poletti, J.L.; Williamson, B.D.P.; Le Heron, J.C. (National Radiation Lab., Christchurch (New Zealand)). 1983. 67p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85701476.

This report describes the development and application of the methods employed in National Radiation Laboratory (NRL) surveys of computed tomography x-ray scanners (CT scanners). It includes descriptions of the phantoms and equipment used, discussion of the various dose parameters measured, the principles of the various dosimetry systems employed and some indication of the doses to occupationally exposed personnel.

32827 (NRPB-R—168) **Review of environmental radiation protection standards.** Hemming, C.R.; Clarke, R.H. (National Radiological Protection Board, Chilton (UK)). Oct 1984. 19p. HMSO, London, price Pound 4.00.

This report attempts to clarify the origins of the often confusing differences in the numerical limits described as radiological protection standards in various countries. The basic standards in use and their application in the UK are compared with the approach

BEST COPY AVAILABLE
FOR REPRODUCTION

adopted in other countries. It is concluded that these differences do not reflect fundamental differences in the protection given to members of the public, but are a result of differing approaches to the application of the same basic system of dose limitation as recommended in ICRP Publication 26. It is shown that these differences do not necessarily lead to significant differences in the actual doses that may be received by members of the public as a result of a given practice.

32828 **(ORNL—6173) Twenty-first nuclear accident dosimetry intercomparison study, August 6-10, 1984.** Swaja, R.E.; Ragan, G.E.; Sims, C.S. (Oak Ridge National Lab., TN (USA)). May 1985. Contract AC05-84OR21400. 40p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012076.

The twenty-first in a series of nuclear accident dosimetry (NAD) intercomparison (NAD) studies was conducted at the Oak Ridge National Laboratory's Dosimetry Applications Research Facility during August 6-10, 1984. The Health Physics Research Reactor operated in the pulse mode was used to simulate three criticality accidents with different radiation fields. Participants from five organizations measured neutron doses between 0.53 and 4.36 Gy and gamma doses between 0.19 and 1.01 Gy at area monitoring stations and on phantoms. About 75% of all neutron dose estimates based on foil activation, hair activation, simulated blood sodium activation, and thermoluminescent methods were within +-25% of reference values. Approximately 86% of all gamma results measured using thermoluminescent (TLD-700 or $CaSO_4$) systems were within +-20% of reference doses which represents a significant improvement over previous studies. Improvements observed in the ability of intercomparison participants to estimate neutron and gamma doses under criticality accident conditions can be partly attributed to experience in previous NAD studies which have provided practical tests of dosimetry systems, enabled participants to improve evaluation methods, and standardized dose reporting conventions. 16 refs., 15 tabs.

32829 **(SAND—85-0385C) Accuracy of coupled Monte-Carlo/next-event-estimator for bremsstrahlung dose predictions.** Pregenzer, A.L.; Halbleib, J.A. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 5p. (CONF-850711—3). NTIS, PC A02/MF A01; GPO Dep. File Number DE85009340.

From 22. annual conference on nuclear and space radiation effects; Monterey, CA, USA (22 Jul 1985).

The accuracy of an efficient new method for predicting combined x-ray production and dosimetry is evaluated at x-ray and γ-ray energies for commonly used detectors by comparing results with a full Monte Carlo treatment.

32830 **(CBPF-NF—023/83) External stress influence on the spin-Peierls phase diagram of the XY model.** Lima, R.A.T. de; Tsallis, C. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 12p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701420.

Within a framework in which the structural degrees of freedom (assumed essentially three-dimensional) are adiabatically treated and the magnetic degrees of freedom are exactly treated, the stress-(magnetic) field-temperature phase diagram associated with the one-dimensional first-neighbour spin-1/2 magnetostrictive XY model is discussed. The important influence of the curvature of the coupling constant as a function of distance is exhibited and satisfactorily compared to experimental data.

32831 **(CBPF-NF—025/83) Criticality of the D=2 anisotropic quantum Heisenberg model.** Caride, A.O.; Tsallis, C.; Zanette, S.I. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 11p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701421.

Within a real space renormalization group framework, the square-lattice spin-1/2 Heisenberg ferromagnet in the presence of an Ising-like anisotropy is discussed. The controversial point on how T sub(c) vanishes in the isotropic Heisenberg limit is analyzed: quite strong evidence is presented favoring a continuous function of anisotropy. The crossover from the isotropic Heisenberg model to the pure Ising one is exhibited.

32832 **(IA—1404, pp 130-131) Probing the microstructure of the GDR in Pb-208.** Berant, Z.; Kahane, S.; Moreh, R.; Shahal, O. Jul 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85780940.

Published in summary form only.

In Research laboratories annual report 1983.

32833 **(INIS-mf—9649) Progress report 1983/1984 of the Institute for Theoretical Physics of the Technical University, Vienna.** Hafner, J. (ed.). (Technische Univ., Vienna (Austria). 1. Inst. fuer Theoretische Physik). Oct 1984. 36p. (In German). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701532.

Overview of work in the fields solid state physics, statistical physics, mathmatical physics, elementary particle physics and quantum mechanics.

32834 **(PUC-TN—02/83) Dilute Potts chain in a magnetic field.** Chaves, C.M.; Riera, R. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Mar 1983. 17p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701424.

The Potts lattice gas in presence of a uniform magnetic field is solved exactly in one dimension. For negative values of the exchange parameter, the magnetization curve exhibits two or three steps, depending on the concentration of vacancies. These steps arise as a result of the competition between the exchange interaction and the magnetic field, being associated to different structural distribution of vacancies and to the magnetic ordering of one or both sublattices.

32835 **(PUC-TN—03/83) Renormalization group treatment for spin waves in the randomly disordered Heisenberg chain.** Chaves, C.M.; Koiller, B. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Mar 1983. 11p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701425.

Local densities of states in the randomly disordered binary quantum Heisenberg chain using a generalization of a recently developed approach based on renormalization group ideas are calculated. It envolves decimating alternate apins along the chain in such a way as to obtain recursion relations to describe the renormalized set of Green's function equations of motion. The densities of states are richly structured, indicating that the method takes into account compositional fluctuations of arbitrary range.

32836 **(PUC-TN—04/83) Renormalization group methods for the spectra of disordered chains.** Robbins, M.O.; Koiller, B. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Mar 1983. 48p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701426.

A family of real space renormalization techniques for calculating the Green's functions of disordered chains is developed and explored. The techniques are based on a recently proposed renormalization method which is rederived here and shown to be equivalent to a virtual crystal approximation on a renormalized Hamiltonian. The derivation suggests how other conventional alloy methods can be coupled to the renormalization concept. Various examples are discussed. Short-range order in the occupation of alloy sites and very general disorder in the Hamiltonian; diagonal, off-diagonal and environmental, are readily incorporated. The techniques are exact in the limits of high and low concentration and of complete short-range order, and for the Lloyd model. All states are found to be localized in agreement with exact treatments. Results for the alloy density of states are presented for various cases and compared to numerical simulations on long chains (10^5 atoms).

32837 **(PUC-TN—05/83) Landau theory for uniaxial systems near a Lifshitz point under applied fields.** Koiller, B.; Lederer, P. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). 1983. 20p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701427.

A Landau-Ginzburg free-energy for uniaxial antiferromagnetic systems exhibiting modulate behaviour is introduced. The field-temperature phase diagrams obtained in the single-harmonic approximation have a triple point which, in some respects, resembles a Lifshitz point. Results for ferromagnetic systems are reproduced taking appropriate values for the parameters in the model. The behaviour of the magnetic susceptibility for finite fields is determined.

32838 **(PUC-TN—07/83) Critical phase for the antiferromagnetic Z(5) model on a square lattice.** Baltar, V.L.; Carneiro, G.M.; Pol, M.E.; Zagury, N. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Apr 1983. 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701428.

The existence of a critical phase for the antiferromagnetic Z(5) model on a square lattice is suggested based on results of Monte Carlo (MC) simulations and of Migdal Kadanoff Renormalization Group calculations (MKRG). The MKRG simulates a line of fixed points which it is interpreted as the locus of attraction of a critical phase. The MC simulations are compatible with this interpretation.

32839 **Kinetics of interfacial motion and bubble movement by vapor transport for a two-component solid solution.** Nichols, F.A. (Materials Science and Technology Division, Argonne National Laboratory, Argonne, Illinois 60439). *Journal of Applied Physics;* **58**: No. 1, 287-291(1 Jul 1985). Contract W-31-109-ENG-38.

The movement of solid-vapor interfaces through transport in the vapor phase has been analyzed by various authors for the case of a single component. When two components exist, the vapor contains more than one species. Such a case has often been analyzed using the total vapor pressure for such systems. We present here an analysis, allowing for preferential evaporation of one species and consequent surface enrichment of the less-volatile species. This leads to a velocity of motion of the form 1/V = 1/V/sub A/+1/V/sub B/, where V/sub A/ and V/sub B/ represent fictional velocities obtaining if only one species is rate controlling. Comparisons are made with some available data on congruently vaporizing compositions of mixed oxides and on the movement of lenticular voids in mixed oxides along thermal gradients, with very reasonable agreements obtained.

32840 **Calculated inverse photoemission cross sections from adsorbed molecules.** Johnson, P.D.; Davenport, J.W. (Department of Physics, Brookhaven National Laboratory, Upton, New York 11973). *Physical Review [Section] B: Condensed Matter;* **31**: No. 12, 7521-7525(15 Jun 1985).

A quantum-theoretical treatment is applied to calculate the cross section for emission of photons produced in inverse photoemission from an adsorbed molecule. Careful consideration of the type of potential that may be used in such calculations shows that photoemission and inverse photoemission from localized levels may be treated as time-reversed processes only above some minimum energy, approximately four times the threshold energy. In situations where time reversal may be used, a simple formula is derived relating the cross sections for photoemission and inverse photoemission. Examination of cross sections shows that the shape resonance frequently observed in photoemission as a final-state effect may manifest itself in inverse photoemission as an initial-state effect.

32841 **Universality among scalar spin systems.** Baker G.A. Jr.; Johnson, J.D. (Theoretical Division, Los Alamos National Laboratory, University of California, Los Alamos, New Mexico 87545). *Physical Review Letters;* **54**: No. 22, 2461-2461(3 Jun 1985).

A comment on critical behavior of the scalar Klauder and double Gaussi models in two dimensions is presented. AIP

32842 **Spin waves at surfaces and interfaces in cubic Heisenberg systems.** Xu, B.X.; Mostoller, M.; Rajagopal, A.K. (Department of Physics and Astronomy, Louisiana State University, Baton Rouge, Louisiana 70803). *Physical Review [Section] B: Condensed Matter;* **31**: No. 11, 7413-7423(1 Jun 1985).

The effects of the underlying crystal structure and the surface or interface normal on spin waves at surfaces and interfaces are examined for cubic crystals described by the Heisenberg Hamiltonian. For surfaces, cleavage and the Goldstone rule by themselves generally favor the formation of surface states. Interface states occur in nearly every case studied in simple model bicrystals. With the same perturbations, there are pronounced differences in the results obtained for different faces of the same crystal, or in those for the same face of different crystals.

32843 **Frozen-phonon total-energy determination of structural surface phase transitions: W(001).** Fu, C.L.; Freeman, A.J.; Wimmer, E.; Weinert, M. (Department of Physics and Astronomy, Northwestern University, Evanston, Illinois 60201). *Physical Review Letters;* **54**: No. 20, 2261-2264(20 May 1985). Contract AC02-76CH00016.

The prototypical W(001) structural phase transition is investigated by all-electron, frozen-phonon, total-energy calculations. The strong coupling between surface states and the M-bar$_5$ phonons plays a decisive role in favoring the reconstructed c(2 x 2) structure with a lateral <110> zig-zag displacement of 0.18 +- 0.01 A (in excellent agreement with experiment) and no interlayer relaxation. The transition from the (1 x 1) into the c(2 x 2) phase proceeds over a very flat region of the energy hypersurface and suppresses the relaxation.

32844 **Comment on "Dislocation-loop theory of the nematic—smectic A—smectic C multicritical point".** Bak, P.; Bruinsma, R. (Physics Department, Brookhaven National Laboratory, Upton, New York 11973). *Physical Review Letters;* **54**: No. 15, 1731-1731(15 Apr 1985). Contract AC02-76CH00016.

A comment on dislocation-loop theory of the Nematic-Smectic Multicriti Point is presented.

32845 **Approximate linear stability analysis of a model of adiabatic shear band formation.** Burns, T.J. (Sandia National Laboratories). *Quarterly of Applied Mathematics;* **43**: No. 1, 65-96(Apr 1985). Contract AC04-76DP00789.

The formation of adiabatic shear bands in ductile metals under dynamic loading conditions is generally thought to result from a material instability, which is associated with a peak in the curve of engineering plastic flow stress vs. engineering shear strain. This instability arises from the effect of thermal softening, caused by irreversible adiabatic heating, which counteracts the tendency of the material to harden with increasing plastic strain. An approximate linear stability analysis of a one-dimensional rigid-thermoviscoplastic model, based on data taken from dynamic torsion experiments on thin-walled tubes of mild steel, shows that shear band formation in this situation can be interpreted as a bifurcation from a homogeneous simple shearing deformation which occurs at the peak in the homogeneous stess vs. strain curve. The asymptotic method of multiple scales is used to show that the growth rate of small perturbations on the homogeneous deformation is controlled by the ratio of the slope of the homogeneous stress vs. strain curve to the material viscosity, i.e., the rate of change of the plastic flow stress with respect to the strain-rate. In addition, it is shown that this growth rate is essentially independent of wavelength in any small perturbation. Numerical methods are used to show that this growth rate beyond the bifurcation point may not be sufficiently large for the model to account for the experimental data, and some suggestions are made on how to modify the constitutive equation so that it better fits the experimental data.

32846 **Superconductivity of palladium tritide.** Schirber, J.E. (Sandia National Labs., Albuquerque, NM (USA)); Mintz, J.M.; Wall, W. (Sandia National Labs., Livermore, CA (USA)). *Solid State Communications;* **52**: No. 10, 837-838(Dec 1984).

The superconductivity and reverse isotope effect have been measured in high pressure tritium gas loaded palladium tritide (PdTsub(x) for x values from 0.72 to 0.81).

6570 Theoretical Physics

REFER ALSO TO CITATION(S) 32540, 32631

32847 **(AD-A—150622/9/XAB) Nonrelativistic Kapitza-Dirac scattering.** Coutsias, E.A.; McIver, J.K. (New Mexico Univ., Albuquerque (USA)). 1984. 56p. NTIS, PC A04/MF A01.

Techniques of singular perturbation theory are used to investigate the scattering of nonrelativistic charged particles by a standing light wave (Kapitza-Dirac scattering). Unlike previous treatments, explicit results are given for the effects of the time-dependent part of the field. For low field intensity/low particle energy, leading order effects can be found from an averaged equation and computed corrections. For the strong fields that can be produced by modern lasers and /or high particle energies, the time dependence of the potential leads to focusing. These methods can be applied to other problems with time-periodic potentials.

32848 **(CBPF-NF—001/83) Exact solution of the Einstein-Cartan field equations.** Roque, W.L.; Fonseca Teixeira, A.F. da. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 12p. (In Portuguese). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701397.

The exact solution of Einstein-Cartan field equations is obtained for an artificial fluid with radially polarized spins, spherically symmetric and under static condition; the energy-momentum metric tensor is taken as zero. The gravitational dynamics is studied for various intensities of torsion (or fluid spin), through the analysis of motion of spinless test particles; in particular, for vanishing torsion we reobtain the Schwarzschild solution. The gravitational effects related to torsion are found sometimes attractive, sometimes repulsive, depending on the value of spin density and on the position and velocity of the test particle.

32849 **(CBPF-NF—007/83) Gravitational coupling of scalar and fermion fields to matter vorticity: microscopic asymmetries.** Soares, I.D.; Tiomno, J. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1983. 81p. NTIS (US Sales Only), PC A05/MF A01. File Number DE85701398.

The gravitational coupling of scalar fields and spin-1/2 fermions to matter vorticity is examined; it is considered in the context of Einstein's theory of gravitation and for technical simplicity the Godel model as the gravitational back-ground whose matter content has a non-null vorticity. Scalar field equation and Dirac equation are solved by separation of the field amplitudes into invariant angular-momentum and energy modes. For each case (scalar or Dirac field) these modes provide two distinct complete bases of solutions, which are bases for two representations of the algebra of the total 'angular momentum' of the system (one finite dimensional and the other infinite-dimensional). The presence of a vorticity field of matter generates, via gravitation, microscopic asymmetries in the physics of fermions. The 'angular-momentum' vector space appears to be polarized along the direction determined by the local vorticity Ω sup(→). Microscopic currents are asymmetric along the direction determined by the vorticity field: fermions (antifermions) currents are larger along the direction antiparallel (parallel) to the vorticity field. This current asymmetry as well other parity violating effects (for example, a split of mass for fermions) can in principle be used in devising experiments to detect the presence of a cosmological rotation of the universe, its direction and intensity. In case of production of pairs under CP violation a net number asymmetry may be generated between fermions and antifermions.

32850 **(CEA-CONF—7431) Collective variables and dissipation.** Balian, R. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). Sep 1984. 32p. (CONF-8409225—1; SPhT—84-122). NTIS (US Sales Only), PC A03/MF A01. File Number DE85751555.

From Colloquium on heavy ion collisions; Cargese, France (2 Sep 1984).

This is an introduction to some basic concepts of non-equilibrium statistical mechanics. We emphasize in particular the relevant entropy relative to a given set of collective variables, the means of the projection method in the Liouville space, its use to establish the generalized transport equations for these variables, and the interpretation of dissipation in the framework of information theory.

32851 **(DESY—84-119) Strong coupling simulation of Euclidean quantum gravity.** Berg, B. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Dec 1984. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751636.

Relying on Regge calculus a systematic numerical investigation of models of 4d Euclidean gravity is proposed. The scale a = l_0 is set by fixing the expectation value of a length. Possible universality of such models is discussed. The strong coupling limit is defined by taking Planck mass msub(p) -> 0 (in units of l_0^{-1}). The zero order approximation msub(p) = 0 is called 'fluctuating space' and investigated numerically in two 4d models. Canonical dimensions are realized and both models give a negative expectation value for the scalar curvature density.

32852 **(DOE/ER/04999—T2) Finite temperature corrections to field theory: electron mass and magnetic moment, and vacuum energy.** Cox, P.H.; Hellman, W.S.; Yildiz, A. (Boston Univ., MA (USA). Dept. of Physics; Harvard Univ., Cambridge, MA (USA). Dept. of Physics). 1983. Contract AC01-78ER04999. 27p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012907.

BUTP-83-001.

A finite temperature formalism which maintains Lorentz convariance is rederived and compared to other approaches. It is used to obtain the order-α temperature shifts in the electron mass and magnetic moment, vacuum energy. The mass and magnetic moment shifts, for kT << m, are of order $\alpha(kT/m)^2$ and hence beyond the present experimental observation limits. An explicit form for the general temperature mass shift is obtained.

32853 **(IFT-P—02/84) Determination of resonance energies and widths for short-range potentials.** Aguilera-Navarro, V.C.; Alves, N.A.; Zimerman, A.H.; Ley Koo, E. (Instituto de Fisica Teorica, Sao Paulo (Brazil)). 1984. 33p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85700971.

Resonance energies and widths are calculated for s and p waves in some spherically-symmetric short-range potentials, using the scattering-matrix, the threshold-matrix and the confinement-in-a-box methods. Numerical results and comparisons of the three methods are presented and discussed.

32854 **(IFT-P—04/84) Behaviour of the gravitational field around the initial singularity.** Francisco, G. (Instituto de Fisica Teorica, Sao Paulo (Brazil)). 1984. 31p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85700979.

The ultralocal representation of the canonically quantized gravitational field is used to obtain the evolution of coherent states in the immediate neighborhood of the singularity. It is shown that smearing functions play the role of classical fields since they correspond to cosmological solutions around the singularity. A special class of ultralocal coherent states is shown to contain the essential aspects of the dynamics of the system when we choose a simple representation for the field operators of the theory. When the ultralocality condition is broken a conjecture will be made about the quantum evolution of coherent states in the classical limit.

32855 **(IFT-P—08/83) Quantization in a spherical geometry.** Ferreira, P.L. (Instituto de Fisica Teorica, Sao Paulo (Brazil)). 1983. 27p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85700972.

Those non-linear systems which, at a classical level, are decribed by the Lagrangian $L=1/2$ $1/1+\Lambda r^2$ [x sup(.)^2 sub(approximately) - Λ (x sub(approximately).x sup(.) sub(approximately))^2/$1+\Lambda r^2$)]-V(r) are investigated. It is shown that this same Lagrangian corresponds to the nonrelativistic motion of a particles of unit mass, constrained to move on a N-sphere S sup(N), where a conservative center of force V(r) is defined. After examining some classical properties, a quantization procedure is discussed, which takes into account the geometrical symmetries involved. It is also shown that case $V(r)=1/2\omega^2 r^2$, corresponding to a isotropic harmonic oscillator in S sup(N), is exactly solvable. Explicit results on the energy spectrum and related eigenfunctions are given for arbitrary value of N. Some general features of the problem are also discussed.

32856 **(IFT-P—11/83) Quantum mechanics in the gaussian wave-packet phase space representation.** Mizrahi, S.S. (Instituto de Fisica Teorica, Sao Paulo (Brazil)). 1983. 37p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85700973.

Some results related to an alternative mapping formulation (to the well known Wigner-Weyl transform) which makes use of the Gaussian Wave Packet or coherent states representation 'pq> are presented. The pair p-q which labels this state, defines a phase-space in which the abstract operators P-circumflex, Q-circumflex, of momentum and position, are represented as differential operators. In the mapped expression of an operator A (P-circumflex, Q-circumflex), the quantum effects appear even when they are absent in the corresponding Wigner-Weyl transform.

32857 **(INIS-BR—254) Experimental display of Fourier analysis through the optical physics and its didatical utilization.** Oliveira, S.M.M. de. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). 1983. 146p. (In Portuguese). NTIS (US Sales Only), PC A07/MF A01. File Number DE85701393.

The properties of Fourier analysis through physical optics are displayed experimentally. Within physical optics topics that illustrate didactically Fourier analysis, a subject usually considered purely mathematical are selected. The most important properties of Fourier transform and their utilization in cleaning up images through spatial filtering are presented, in this way the properties of convolution to analyse image formation and characterize some diffraction patterns are also used.

32858 **(INIS-mf—9305) Perturbation of Schroedinger Hamiltonians by measures - self-adjointness and lower semiboundedness.** Brasche, J. (Bielefeld Univ. (Germany, F.R.). Fakultaet fuer Mathematik). Apr 1984. 23p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85780917.

We study the Hamiltonians for nonrelativistic quantum mechanics in one dimension in terms of energy forms $\int$vertical strokedf/dxvertical stroke^{2}dx+$\int$vertical strokefvertical stroke^2 d(μ-ν), where μ and ν are positive, not necessarily finite measures on the real line. We cover, besides regular potentials, also cases of very singular interactions (e.g., a particle interacting with an infinite number of fixed particles by 'delta function potentials' of arbitrary strengths). We give conditions for lower semiboundedness and closability of above energy forms which are sufficient and, for certain classes of potentials, (e.g. μ-ν a signed measure) also necessary. In contrast to the results in other approaches no regularity conditions and no restrictions on the growth of the measures μ and ν at infinity are needed. (orig.).

32859 **(IPP—6/244) Stochastic runaway of dynamical systems.** Pfirsch, D.; Graeff, P. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). Oct 1984. 30p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85780954.

One-dimensional, stochastic, dynamical systems are well studied with respect to their stability properties. Less is known for the higher dimensional case. This paper derives sufficient and necessary criteria for the asymptotic divergence of the entropy (runaway) and sufficient ones for the moments of n-dimensional, stochastic, dynamical systems. The crucial implication is the incompressibility of their flow defined by the equations of motion in configuration space. Two possible extensions to compressible flow systems are outlined.

32860 **(ITF—83-95-R) Description of the equilibrium states of the thermodynamic systems.** Kravchuk, N.V. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). Aug 1983. 24p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85700975.

The review of some recent results on the characterization of the equilibrium states of the infinite systems of quantum statistical mechanics is presented.

32861 **(ITF—83-120-R) Beta-functions of the nonlinear σ-models on some noncompact symmetric spaces.** Gavrilik, A.M. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). Sep 1983. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85700974.

The expressions for renormalization group beta-functions of the nonlinear σ-models on the noncompact symmetric spaces $SO^*(2n)/U(n)$ and $SU^*(2n)/Sp(n)$ are found. The evaluation of the first coefficients of beta-functions is based upon certain isomorphisms of noncompact groups and some geometric properties of dual symmetric spaces.

32862 **(ITF—83-134-R) Dynamic systems in statistical physics.** Kravchuk, N.V. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). Oct 1983. 21p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85700970.

Non-commutative dynamic systems based on arbitrary *-algebras are investigated. A class of IA*-dynamic system is introduced and studied. Classes of equilibrium states of such systems are singled out by means of correlation inequalities. For certain classes of systems the correlation with KMS states is examined.

32863 **(JINR—11-83-875) Calculation of matrix elements of the three-body system relativistic Hamiltonian in adiabatic representation.** Bakalov, D. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1983. 13p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85700978.

Matrix elements of the three-body relativistic Hamiltonian in adiabatic representation are reduced to two-dimensional integrals of functions with integrable singularities in poles of the spheroidal coordinate system. A cubature formula for calculating the integrals is obtained, which provides relative accuracy $<= 10^{-5}$ for calculating matrix elements over wave functions of discrete spectrum of two-centre problem. The table is given which presents points and weights of cubature formula. A detailed description of MAIN program for calculation of matrix elements of operators in adiabatic representation is given. The main program is written in FORTRAN language and is oriented for CDC-6500 computer. Matrix elements of operators describing relativistic effects in mesic molecules of hydrogen isotopes are calculated by means of the MAIN program with $<= 10^{-5}$ relative accuracy.

32864 **(JINR—R-2-83-872) Quantum mechanics and Hopf fibre bundles. Green function.** Polubarinov, I.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1983. 19p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85700976.

A transformation from the Cartesian coordinates in 2-, 3- and 5-dimensional spaces to spinor ones is considered in two-body problems in quantum mechanics. These transformations are based on a two-fold covering of a circle by circle and on Hopf fibre bundles $S^3 \hookrightarrow S^2$ and $S^7 \hookrightarrow S^4$. Two-particle Green functions in the 2, 3 and 5 dimensions are represented to be integrals over fibres of some other Green functions in 2, 4 and 8 dimensions. Coulomb and free Green functions are expressed via well-known Green functions for many-dimensional harmonic oscillators.

32865 (JINR—R-4-84-100) **To the theory of scattering by two potentials.** Belyaev, V.B.; Zubarev, A.L.; Latipov, A.Sh. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1984. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85700977.

To investigate the off-shell properties of a two-body potential, we proposed to study the scattering amplitude on two potentials. We have analysed the behaviour of scattering lengths and phases on the whole potential as a function of the off-shell properties of one of the potentials. The largest sensitivity to the off-shell properties is observed at low energies.

32866 (LBL—19302) **Gravity theories in more than four dimensions.** Zumino, B. (Lawrence Berkeley Lab., CA (USA)). Mar 1985. Contract AC03-76SF00098. 7p. (CONF-8405312—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011164.

From Modern methods in quantum field theory conference; Amalfi, Italy (7 May 1984).

String theories suggest particular forms for gravity interactions in higher dimensions. We consider an interesting class of gravity theories in more than four dimensions, clarify their geometric meaning and discuss their special properties. 9 refs.

32867 (PUC-TN—25/83) **Recent developments in high-frequency scattering.** Nussenzveig, H.M. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). 1983. 14p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701394.

Recent applications of the complex angular momentum theory of Mie scattering are reviewed: (i) very accurate asymptotic expansions for the average Mie cross sections for extinction, absorption and radiation pressure, averaged over a small range of size dispersion, have been obtained; (ii) forward optical glory effects have been predicted; (iii) A new diffraction effect, critical scattering, that takes place in the transition region around the critical scattering angle, has been treated, yielding results in good agreement with the exact Mie values. An overview of the major diffraction effects found in Mie scattering is also given.

32868 (PUC-TN—27/83) **Phase behavior in diffraction.** Checon, A. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). 1983. 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701395.

Theoretical formulation of a straight edge diffraction shows a phase difference of $\pi/2$ between the incoming and diffracted waves. Experiments using two straight edges do not confirm the $\pi/2$ difference but suggest that the incoming wave is in phase with the wave diffracted into the shadowed region of the edge and out of phase by a factor of π with the wave diffracted into the illuminated region.

32869 (UWThPh—84-40) **Grassmann expansion of the classical N=2 supergravity field equations.** Embacher, F. (Technische Univ., Vienna (Austria). 1. Inst. fuer Theoretische Physik). 1984. 17p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701399.

The classical field equations of N=2 supergravity are expanded with respect to an infinite dimensional Grassmann algebra. The general freedom in constructing classical solution is exhibited. As an application, a uniqueness theorem for supersymmetric extreme black holes is given.

32870 (UWThPh—84-42) **Geometric proof of Liouville's theorem.** Gruemm, H.R. (Technische Univ., Vienna (Austria). 1. Inst. fuer Theoretische Physik). 1984. 3p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701396.

We present a geometric proof of Liouville's theorem on the existence of canonical coordinates for integrable systems.

32871 **Comparison of energy estimators used in quantum Monte Carlo calculations.** Doll, J.D.; Freeman, D.L. (Chemistry Division, University of California, Los Alamos National Laboratory, MS 6-738, Los Alamos, New Mexico 87545). *Journal of Chemical Physics;* **83**: No. 2, 768-771(15 Jul 1985).

Path-integral Monte Carlo calculations in quantum statistical mechanics have been performed using either discretized methods or Fourier methods. In each of these methods the internal energy has been calculated using either temperature differentiation or direct operation on the density matrix by the Hamiltonian. It is shown that the variance of the internal energy calculated by operation of the Hamiltonian on the density matrix in the Fourier method is independent of the number of Fourier components included in the expansion of the paths for a number of systems. The variance of the internal energy obtained from the other methods is shown to grow with the size of the expansion used for all systems.

32872 **Denominator function for canonical SU(3) tensor operators.** Biedenharn, L.C.; Lohe, M.A.; Louck, J.D. (Duke University, Durham, North Carolina 27706 and Los Alamos National Laboratory, Theoretical Division, Los Alamos, New Mexico 87545). *Journal of Mathematical Physics (New York);* **26**: No. 7, 1458-1492(Jul 1985). Contract W-7405-ENG-36.

The definition of a canonical unit SU(3) tensor operator is given in terms of its characteristic null space as determined by group-theoretic properties of the intertwining number. This definition is shown to imply the canonical splitting conditions used in earlier work for the explicit and unique (up to +- phases) construction of all SU(3) WCG coefficients (Wigner—Clebsch—Gordan). Using this construction, an explicit SU(3)-invariant denominator function characterizing completely the canonically defined WCG coefficients is obtained. It is shown that this denominator function (squared) is a product of linear factors which may be obtained explicitly from the characteristic null space times a ratio of polynomials. These polynomials, denoted G/sup t//sub q/, are defined over three (shift) parameters and three barycentric coordinates. The properties of these polynomials (hence, of the corresponding invariant denominator function) are developed in detail: These include a derivation of their degree, symmetries, and zeros. The symmetries are those induced on the shift parameters and barycentric coordinates by the transformations of a 3 x 3 array under row interchange, column interchange, and transposition (the group of 72 operations leaving a 3 x 3 determinant invariant). Remarkably, the zeros of the general G/sup t//sub q/ polynomial are in position and multiplicity exactly those of the SU(3) weight space associated with irreducible representation [q-1,t-1,0]. The results obtained are an essential step in the derivation of a fully explicit and comprehensible algebraic expression for all SU(3) WCG coefficients.

32873 **Cluster-size distributions for irreversible cooperative filling of lattices. I. Exact one-dimensional results for coalescing clusters.** Nord, R.S.; Hoffman, D.K.; Evans, J.W. (Ames Laboratory and Department of Chemistry, Iowa State University, Ames, Iowa 50011). *Physical Review [Section] A: General Physics;* **31**: No. 6, 3820-3830(Jun 1985). Contract W-7405-ENG-82.

We consider processes where the sites of an infinite, uniform lattice are filled irreversibly and cooperatively, with the rate of adsorption at a site depending on the state of its nearest neighbors (only). The asymmetry between empty and filled sites, associated with irreversibility, leads one to consider the closed infinite coupled hierarchies of rate equations for probabilities of connected and singly, doubly, etc., disconnected empty subconfigurations and results in an empty-site-shielding property. The latter allows exact solutions, via truncation, of these equations in one dimension and is used here to determine probabilities of filled s-tuples, f/sub s/ ($f_1$equivalentθ is the coverage), and thus of clusters of exactly s filled sites, n/sub s/equivalentf/sub s/-2f/sub s+1/+f/sub s+2/ for s< or =13 and 11, respectively. When all rates are nonzero so that clusters can coalesce, the f/sub s/ and n/sub s/ distributions decay exponentially as s→∞, and we can accurately estimate the asymptotic decay rate λ(θ)equivalent lim/sub s/→∞ f/sub s+1//f/sub s/equivalent lim/sub s/→∞ n/sub s+1//n/sub s/, where 0 = λ(0)< or =λ(θ)< or =λ(1) = 1. Divergent behavior of the average cluster size, as θ→1, is also considered.

32874 Statistical mechanical origin of the entropy of a rotating, charged black hole. Zurek, W.H.; Thorne, K.S. (Theoretical Astrophysics, Los Alamos National Laboratory, Los Alamos, New Mexico 87545 and California Institute of Technology, Pasadena, California 91125). *Physical Review Letters;* **54**: No. 20, 2171-2175(20 May 1985).

It is shown that the entropy of a rotating, charged black hole is, in senses made precise in the paper, (i) the logarithm of the number of quantum mechanically distinct ways that the hole could have been made, and (ii) the logarithm of the number of configurations that the hole's "atmosphere," as measured by stationary observers, could assume in the presence of its background noise of acceleration radiation. In addition, a proof is given of the generalized second law of thermodynamics.

32875 Statistical behavior in deterministic quantum systems with few degrees of freedom. Jensen, R.V.; Shankar, R. (Mason Laboratory, Yale University, New Haven, Connecticut 06520). *Physical Review Letters;* **54**: No. 17, 1879-1882(29 Apr 1985). Contract AC02-76ER03075.

Numerical studies of the dynamics of finite quantum spin chains are presented which show that quantum systems with few degrees of freedom (N = 7) can be described by equilibrium statistical mechanics. The success of the statistical description is seen to depend on the interplay between the initial state, the observable, and the Hamiltonian. This work clarifies the impact of integrability and conservation laws on statistical behavior. The relation to quantum chaos is also discussed.

32876 Resonance widths and positions by an algebraic approach. Alhassid, Y.; Iachello, F.; Levine, R.D. (A. W. Wright Nuclear Structure Laboratory, Yale University, New Haven, Connecticut 06511). *Physical Review Letters;* **54**: No. 16, 1746-1749(22 Apr 1985). Contract AC02-76ER03074.

The use of nonunitary discrete, irreducible representations of Lie algebras is proposed as a method for the determination of widths and energies of resonances. The method is illustrated by explicit application to three kinds of resonances: in transmission over a well, in transmission over a barrier, and in barrier penetration for a family of one-dimensional potentials. The same procedure is also useful in an algebraic approach to scattering by a complex (optical) potential, and for parametrizing of the resonant contribution to the scattering matrix.

32877 Asymptotic equivalence of Fokker-Planck and diffusion solutions for large time. Ganapol, B.D.; Larsen, E.W. (Department of Nuclear and Energy Engineering, University of Arizona, Tucson, Arizona 85721). *Transport Theory and Statistical Physics;* **13**: No. 3, 635-677(Jul 1984).

Some recent results of Beals and Protopopescu are obtained for a different class of problems using a simpler method of proof.

32878 (AD-A—151270/6/XAB) Very large least-squares problems and supercomputers. Rice, J.R. (Purdue Univ., Lafayette, IN (USA). Dept. of Computer Science). 31 Dec 1984. 17p. NTIS, PC A02/MF A01.

The goals of the workshop were: (a) to provide an interchange between different groups working on very large least-squares problems, (b) to provide an interchange between computer scientists involved with supercomputer systems and scientists using supercomputers and, (c) to assess the state of the art in solving very large least-squares problems. Twelve sources of very large least-squares problems were identified. The ones principally involved in the discussions were: geodetic surveys; photogrammetry; molecular structures; gravity field of the earth; and partial differential equations.

32879 (IFT-P—07/83) New algebraic tables of SU(2) quantities. Alcaras, J.A.C.; Vanagas, V. (Instituto de Fisica Teorica, Sao Paulo (Brazil)). 1983. 24p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701117.

Formulas for Clebsch-Gordan Coefficients, 6-j symbols and 9-j symbols of SU(2) are presented in a ready-to-program way for obtaining algebraic tables. An excerpt of the complete tables are also presented.

32880 (SOL—85-1) Properties of a representation of a basis for the null space. Gill, P.E.; Murray, W.; Saunders, M.A.; Stewart, G.W.; Wright, M.H. (Stanford Univ., CA (USA). Systems Optimization Lab.). Feb 1985. Contract AT03-76ER72018. 19p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012381.

Given a rectangular matrix A(x) that depends on the independent variables x, many constrained optimization methods involve computations with Z(x), a matrix whose columns form a basis for the null space of A/sup T/(x). When A is evaluated at a given point, it is well known that a suitable Z (satisfying A/sup T/Z = 0) can be obtained from standard matrix factorizations. However, Coleman and Sorensen have recently shown that standard orthogonal factorization methods may produce orthogonal bases that do not vary continuously with x; they also suggest several techniques for adapting these schemes so as to ensure continuity of Z in the neighborhood of a given point. This paper is an extension of an earlier note that defines the procedure for computing Z. Here, we first describe how Z can be obtained by updating an explicit QR factorization with Householder transformations. The properties of this representation of Z with respect to perturbations in A are discussed, including explicit bounds on the change in Z. We then introduce regularized Householder transformations, and show that their use implies continuity of the full matrix Q. The convergence of Z and Q under appropriate assumptions is then proved. Finally, we indicate why the chosen form of Z is convenient in certain methods for nonlinearly constrained optimization.

32881 Monte-Carlo error analysis in x-ray spectral deconvolution. Shirk, D.G.; Hoffman, N.M. (Applied Theoretical Physics Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87544). *Review of Scientific Instruments;* **56**: No. 5, 809-811(May 1985).

The deconvolution of spectral information from sparse x-ray data is a widely encountered problem in data analysis. An often-neglected aspect of this problem is the propagation of random error in the deconvolution process. We have developed a Monte-Carlo approach that enables us to attach error bars to unfolded x-ray spectra. Our Monte-Carlo error analysis has been incorporated into two specific deconvolution techniques: the first is an iterative convergent weight method; the second is a singular-value-decomposition (SVD) method. These two methods were applied to an x-ray spectral deconvolution problem having m channels of observations with n points in energy space. When m is less than n, this problem has no unique solution. We discuss the systematics of nonunique solutions and energy-dependent error bars for both methods. The Monte-Carlo approach has a particular benefit in relation to the SVD method: It allows us to apply the constraint of spectral nonnegativity after the SVD deconvolution rather than before. Consequently, we can identify inconsistencies between different detector channels.

32882 Diffusion-synthetic acceleration methods for discrete-ordinates problems. Larsen, E.W. (University of California, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Transport Theory and Statistical Physics;* **13**: No. 1, 107-126(Jan 1984).

The diffusion-synthetic acceleration (DSA) method is an iterative procedure for obtaining numerical solutions of discrete-ordinates problems. The DSA method is operationally more complicated than the standard source-iteration (SI) method, but if encoded properly it converges much more rapidly, especially for problems with diffusion-like regions. In this article we describe the basic ideas behind the DSA method and give a (roughly chronological) review of its long development. We conclude with a discussion which covers additional topics, including some remaining open problems an the status of current efforts aimed at solving these problems.

32883 **Nonlinear semigroup whose generator is not dissipative.** Busenberg, S.N.; Travis, C.C. (Harvey Mudd College, Claremont, CA). *Houston Journal of Mathematics;* 9: No. 3, 363-372(1983). Contract W-7405-ENG-26.

This paper provides an example of a nonlinear semigroup in a Hilbert space that arises naturally in the study of population diffusion and whose infinitesimal generator is not omega-dissipative. Nevertheless, this semigroup is related to its generator through the usual nonlinear exponential formula. 7 references.

32884 **(DOE/ER/03077—245) Some rigorous results concerning spectral theory for ideal MHD.** Laurence, P. (New York Univ., NY (USA). Courant Inst. of Mathematical Sciences). May 1985. Contract AC02-76ER03077. 46p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85013427.

Spectral theory for linear ideal MHD is laid on a firm foundation by defining appropriate function spaces for the operators associated with both the first and second order (in time and space) partial differential operators. Thus, it is rigorously established that a self-adjoint extension of $F(\xi)$ exists. It is shown that the operator L associated with the first order formulation satisfies the conditions of the Hille-Yosida theorem. A foundation is laid thereby within which the domains associated with the first and second order formulations can be compared. This allows future work in a rigorous setting that will clarify the differences (in the two formulations) between the structure of the generalized eigenspaces corresponding to the marginal point of the spectrum $\omega = 0$.

32885 **(DOE/ET/51017—T2) Symmetric Tandem Mirror program. Annual progress report.** (TRW Space and Technology Group, Redondo Beach, CA (USA). Energy Div.). 1985. Contract AC03-79ET51017. 56p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85012352.

The STM program was initiated in June 1979. The overall objective was to examine confinement of high-β plasmas in an axisymmetric mirror configuration which are stabilized by the presence of a plasma produced, annular magnetic well (ELMO-ring). To accomplish this objective, we chose to generate the high-β mirror-confined plasmas by ICRH. The annular wells result from diamagnetism of hot electrons generated by ECRH. The development of techniques for controlling the spatial and energy distributions of these electrons was an essential ingredient in our program. The culmination of this work is the successful generation of hot-ion plasmas by ICRH with anti n $\sim 1 \times 10^{13}$ cm^{-3} and T/sub i/ $\sim$ 300 eV corresponding to anti $\beta \cong 5\%$.

32886 **(DOE/ET/53051—79) Observation of helical sawtooth oscillations in a tokamak.** Brickhouse, N.S.; Osborne, T.H.; Dexter, R.N.; Prager, S.C. (Wisconsin Univ., Madison (USA). Dept. of Physics). Feb 1985. Contract AC02-76ET53051. 11p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012062.

In the Tokapole II tokamak the three-dimensional structure of the rapid sawtooth crash which accompanies internal disruptions has been observed. The sawtooth crash is helical, i.e., the decrease in soft X ray intensity occurs along a $q = 1$ helical contour, in accord with the standard reconnection model. The poloidally asymmetric radial expansion of the crash inward from the $q = 1$ surface, provides a measure of the reconnection time consistent with single helicity reconnection from a growing, non-rotating magnetic island.

32887 **(DOE/ET/53072—T1) Application of nonlinear methods to some current problems in fusion plasma physics. Final report.** Treve, Y.M. (Treve (Yvain M.), Santa Barbara, CA (USA)). 26 Mar 1984. Contract AC03-78ET53072. 4p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011579.

This is the final report of the work done on Contract ASO3-78ET53072, "Application of Nonlinear Methods to Some Current Problems in Fusion Plasma Physics". Most of the effort has been devoted to the problem of the reliability of numerical simulation of MHD flows. We also have studied some topological aspects of the period-doubling phenomenon for some forced nonlinear oscillators.

32888 **(DOE/ET/53088—177) Local conservation laws for the Maxwell-Vlasov and collisionless kinetic guiding center theories.** Pfirsch, D.; Morrison, P.J. (Texas Univ., Austin (USA). Inst. for Fusion Studies). Apr 1985. Contract FG05-80ET53088. 17p. (IFSR—177). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013122.

Using one of the author's recent variational formulation of the Maxwell-Vlasov and guiding center theories, the energy-momentum and angular momentum tensors for such theories are derived and the corresponding local conservation laws are proven. The energy-momentum tensor is shown to be symmetric in its spatial components while the angular momentum density is naturally antisymmetric.

32889 **(DOE/ET/53088—179) Scale separation closure and Alfven wave turbulence.** Chen, C.Y.; Mahajan, S.M. (Texas Univ., Austin (USA). Inst. for Fusion Studies). Apr 1985. Contract FG05-80ET53088. 24p. (IFSR—179). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013124.

Based on the concept of scale separation between coherent response function and incoherent source for renormalized turbulence theories, a closure scheme is proposed. A model problem dealing with shear-Alfven wave turbulence is numerically solved; the solution explicitly shows expected turbulence features such as frequency shift from linear modes, band-broadening, and a power law dependence for the turbulence spectrum.

32890 **(DOE/ET/53088—187) Current interruption by density depression.** Wagner, J.S.; Tajima, T.; Akasofu, S.I. (Texas Univ., Austin (USA). Inst. for Fusion Studies; Alaska Univ., Fairbanks (USA). Geophysical Inst.). Apr 1985. Contract FG05-80ET53088. 25p. (IFSR—187). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013120.

Using a one-dimensional electrostatic particle code, we examine processes associated with current interruption in a collisionless plasma when a density depression is present along the current channel. Current interruption due to double layers was suggested by Alfven and Carlqvist (1967) as a cause of solar flares. At a local density depression, plasma instabilities caused by an electron current flow are accentuated, leading to current disruption. Our simulation study encompasses a wide range of the parameters in such a way that under appropriate conditions, both the Alfven and Carlqvist (1967) regime and the Smith and Priest (1972) regime take place. In the latter regime the density depression decays into a stationary structure ("ion-acoustic layer") which spawns a series of ion-acoustic "solitons" and ion phase space holes travelling upstream. A large inductance of the current circuit tends to enhance the plasma instabilities.

32891 **(DOE/ET/53088—190) High energy plasma accelerators.** Tajima, T. (Texas Univ., Austin (USA). Inst. for Fusion Studies). May 1985. Contract FG05-80ET53088. 144p. (IFSR—190). NTIS, PC A07/MF A01; GPO Dep. File Number DE85013121.

Colinear intense laser beams ω_0, κ_0 and ω_1, κ_1 shone on a plasma with frequency separation equal to the electron plasma frequency ω/sub pe/ are capable of creating a coherent large longitudinal electric field E/sub L/ = mc ω/sub pe//e of the order of 1GeV/cm for a plasma density of 10^{18} cm^{-3} through the laser beat excitation of plasma oscillations. Accompanying favorable and deleterious physical effects using this process for a high energy beat-wave accelerator are discussed: the longitudinal dephasing, pump depletion, the transverse laser diffraction, plasma turbulence effects, self-steepening, self-focusing, etc. The basic equation, the driven nonlinear Schroedinger equation, is derived to describe this system. Advanced accelerator concepts to overcome some of these problems are proposed, including the plasma fiber accelerator of various variations. An advanced laser architecture suitable for the beat-wave accelerator is suggested. Accelerator physics issues such as the luminosity are discussed. Applications of the present process to the current drive in a plasma and to the excitation of collective oscillations within nuclei are also discussed.

32896 **(IPF—84-4) Four-fluid description of turbulent plasma focus dynamics.** Hayd, A.; Maurer, M.; Meinke, P.; Kaeppeler, H.J. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Plasmaforschung). Jun 1984. 20p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85780962.

The dynamic phenomena in the compression, pinch and late phases of the plasma focus experiment POSEIDON in its operational mode at 60 kV, 280 kJ, were previously calculated from a two-fluid theory using the new hybrid code REDUCE/FORTRAN. Two important results were found: the neutron production already in the pinch phase for currents larger than 500 kA and filamentary structures on and around the pinch axis. In a continuation of this work, a four-fluid system of dynamical equations was formulated and programmed with the REDUCE/FORTRAN code. Besides macro-turbulence, the new four-fluid theory includes micro-instabilities and anomalous transport properties, as well as the runaway effect for electrons and ions. First results from calculations with this new theory are presented and are compared with previous calculations and with recent experimental observations.

32897 **(IPF—84-10) Two phases of neutron production in the Poseidon plasma focus.** Herold, H.; Bertalot, L.; Hirano, K.; Jaeger, U.; Kaeppeler, H.J.; Schmidt, H.; Schmidt, R.; Shakhatre, M.; Shyam, A.; Sadowski, M. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Plasmaforschung). Sep 1984. 20p. (CONF-840910—26; IAEA-CN—44/D-III-6-3). NTIS (US Sales Only), PC A02/MF A01. File Number DE85780958.

From 10. international conference on plasma physics and controlled nuclear fusion research; London, UK (12 Sep 1984).

Various measurements performed in the 280 kJ, 60 kV operational mode of the Poseidon plasma focus confirm that at high pinch currents (approx.= 1 MA) there exist two phases of suprathermal neutron production. In the pinch phase, the neutron emission from a macroscopically smooth, relatively quiet thermal (Tsub(i) approx.= 1 k to 0.4 keV) plasma column is very likely caused by accelerated deuterons (<= 400 keV) trapped for up to 100 ns in the pinch by gyro-motion and relaxation. MHD calculations suggest that the acceleration may be due to an MHD-instability induced reconfiguration process, leading to current filamentation and high Bsub(z)-fields. In soft X-ray pictures filaments, particularly a central filament, were observed. Indications for Bsub(z)-fields were deduced from the directions of the reaction proton trajectories. The rather irreproducible, strong neutron production in the second phase is associated with m = 0 pinch break-ups and with fast deuterons accelerated mainly in axial direction.

32898 **(IPP—1/228) Proposed method for fast determination of plasma parameters.** Braams, B.J.; Lackner, K. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). Sep 1984. 17p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751545.

32899 **(IPP—4/219) Second harmonic ion cyclotron resonance heating in ASDEX: Results of ray tracing calculations.** Steinmetz, K.; Brambilla, M. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). Jul 1984. 47p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85780956.

First ray tracing cumputations based on typical ASDE hydrogen plasma parameters are presented. It is shown that the heating efficiency is already appreciable for ohmically heated discharges, where, depending on density, 10 to 25% single transit absorption has been calculated. The efficiency strongly increases with electron density and plasma temperature reaching more than 40% single transit absorption at Tsub(io) = 3 keV, Tsub(eo) = 1.5 keV, nsub(eo) = 5 x 10^{13} cm^{-3}. Well defined power depositions profiles with peak power densities of a few W/cm^3 per MW and of small halfwidth are found to be rather insensitive to typically observed variations of plasma density and temperature profiles. In the temperature range explored so far most wave power is transferred to the plasma ions.

32900 **(IPP—6/235) Normal mode analysis for linear resistive magnetohydrodynamics.** Kerner, W.; Lerbinger, K.; Gruber, R.; Tsunematsu, T. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). Oct 1984. 56p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85780951.

The compressible, resistive MHD equations are linearized around an equilibrium with cylindrical symmetry and solved numerically as a complex eigenvalue problem. This normal mode code allows to solve for very small resistivity eta proportional 10^{-10}. The scaling of growthrates and layer width agrees very well with analytical theory. Especially, both the influence of current and pressure on the instabilities is studied in detail; the effect of resistivity on the ideally unstable internal kink is analyzed.

32901 **(IPP—6/237) Fluctuation spectrum for linear gyroviscous MHD.** Caldas, I.L.; Tasso, H. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). May 1984. 9p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85780966.

The influence of gyroviscosity on the fluctuations of an MHD plasma is investigated. The main result is that gyroviscosity does not help to remove ultraviolet divergences. For a sub-class of observables it does not even show up. The full non-linear problem may be needed.

32902 **(IPP—6/241) Three-drift-wave interaction at finite parallel wavelength: Bifurcations and transition to turbulence.** Biskamp, D.; He Kaifen. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). Aug 1984. 32p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85780949.

The generic properties of the nonlinear interaction of three driftwaves with finite kappasub(parallel) are investigated. The different types of stationary or quasi-stationary states are characterized by the bifurcation diagram in γ_1, kappa parameter space, where γ_1 measures the mode excitation and kappa the parallel wave number. The transition to turbulence corresponds exactly to the Ruelle-

Takens picture: steady state -> periodic solution -> doubly periodic solution -> turbulence, in contrast to the periodic-doubling route usually observed in low-dimensional dynamic systems.

32903 (IPP—6/242) Resistive spectrum of configurations without magnetic shear. Lortz, D.; Spies, G. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). Aug 1984. 18p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85780950.

The problem of determining the normal modes of a slightly resistive, incompressible plasma slab with unidirectional fields is reduced to quadratures. The eigenfrequencies are on a system of curves in the stable part of the complex plane which are independent of the resistivity eta. For finite wave number the distance from the tip of the ideal Alfven continuum of the nearest eigenvalue is O(etasup(1/3)). The first correction to this is O(1/vertical strokeln etavertical stroke), which thus only becomes small for unrealistically small values of eta. Including this logarithmic correction yields quantitative agreement with numerical computations.

32904 (JAERI-M—84-047) Irradiation effects on components of spectroscopic measurement device for JT-60 diagnostics. Nishitani, Takeo; Sugie, Tatsuo; Tanaka, Ryuichi. (Japan Atomic Energy Research Inst., Tokyo). Mar 1984. 50p. (In Japanese). NTIS (US Sales Only), PC A03/MF A01. File Number DE85700992.

Irradiation effects on photomultiplier tubes, silicon photodiodes, electronics, glass plates, mirrors, gratings and optical glasses, which are components of spectroscopic measurements for JT-60 diagnostics, are investigated. They are exposed by γ-rays at exposure rate 10^2 up to 10^5 R/h and optical glasses are irradiated by neutrons at about 10^{12} n/cm^2. Photomultipliers and silicon photodiodes have undesirable large efficiencies for γ-ray detection, and the former's dark currents increase by irradiation. An analog circuit operates normally under the γ-ray exposure rate up to 10^5 R/h, but a counter device in the digital circuit are broken down at exposure rate 10^5 R/h. No irradiation effect is found in mirrors and gratings after 4 x 10^4 R exposure. In irradiation experiments of γ-rays and neutrons, nonbrown glasses are not colored.

32905 (LA-UR—85-1789) Increased particle confinement with the use of external dc bias field in the CTX spheromak. Barnes, C.W.; Hoida, H.W.; Henins, I.; Fernandez, J.C.; Jarboe, T.R.; Marklin, G.J. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 6p. (CONF-8505100—5). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012744.

From 7. US symposium on compact toroid research; Santa Fe, NM, USA (21 May 1985).

Spheromaks are formed in a mesh flux conserver in the presence of an external dc bias field. The spheromaks remain stable to tilt instabilities with ratios of bias-to-spheromak flux of up to 47 +- 7%. Normally applied bias flux puts the spheromak separatrix inside the metal mesh and improves the particle confinement.

32906 (N—85-18747) Coordinated research program at IAEA on atomic collision data for plasma diagnostics. Itikawa, Y. (Institute of Space and Astronautical Science, Tokyo (Japan)). Nov 1984. 5p. NTIS, PC A07/MF A01.

Evaluated data sets of atomic collision data were generated in accordance with requirement priorities determined by the fusion community were generated. The collision processes the highest priority are: (1) electron impact excitation of ions; (2) electron impact ionization of the ions; and (3) charge exchange, and related processes like dielectronic recombination, ion impact ionization. The current status of the relevant data and recommendations are presented. It is recommended that cross sections for collision processes are used for diagnositcs and plasma modeling.

32907 (N—85-18772) Energy spectra of slowed-down neutrals from the heating beams in ASDEX. Notermans, G.H.J. (FOM-Instituut voor Plasmafysica, Jutphaas (Netherlands)). Jul 1984. 29p. (REPT—84-157). NTIS, PC A03/MF A01.

Measurements of the slowing-down spectrum of the ASDEX Tokamak heating beam are compared with predictions based on a numerical solution of the Fokker-Planck equation in a two-dimensional velocity space. The result is used to evaluate the charge exchange spectrum of confined beam particles, emerging from the plasma under various angles with respect to the magnetic field. This flux is compared with the yield stemming from direct scattering of the neutral beam particles on the plasma ions. (ESA)

32908 (N—85-18775) Improved directional couplers for overmoded waveguide systems. Janzen, G.; Stickel, H. (Stuttgart Univ. (Germany, F.R.)). Jan 1984. 15p. (IPF—84-1). NTIS, PC A02/MF A01.

Directional couplers for waveguides used in plasma heating of thermonuclear fusion devices were tested: TE11 coupler, 28 GHz, 40 mm dia TE11, 70 GHz 27.79 mm TE02, 60 GHz, 63.4 mm and TE03, 28 GHz, 63.4 mm. Multihole couplers showing insufficient suppression of single modes or insufficient directivity can be improved by adding holes of a shifted coupler structure of the same kind. A shifted structure improving the directivity also enhances suppression of unwanted modes propagating in backward direction. Marked suppression of a single unwanted backward mode also improves suppression of the other backward modes as well as directivity. Marked suppression of an unwanted mode in forward direction with very similar phase velocity to the desired mode can be problematic, because the desired mode amplitude may be considerably reduced by this measure. (ESA)

32909 (N—85-18776) Four phase model for turbulent instabilities calculation in plasma jets. Hayd, A.; Kaeppeler, H.J.; Haurer, M.; Meinke, P. (Stuttgart Univ. (Germany, F.R.)). Mar 1984. 22p. (In German). (IPF—84-2). NTIS, PC A02/MF A01.

A two phase theory which describes the plasma compression, pinch and decay phase for the plasma generator POSEIDON in the range 280 kJ, 60 kV is presented. The REDUCE/FORTRAN hybricode calculation was made. This shows neutron production in the pinch phase. For dynamic calculation of the plasma jet, a four phase theory was derived to cope with macro and microturbulence. The results of both calculations were compared to experimental observations on POSEIDON. (ESA)

32910 (N—85-18777) Lidar-Thomson scattering. Final report, 15 June 1984. Brederlow, G.; Gruber, J.E.; Hirsch, K.; Roehr, H. (Stuttgart Univ. (Germany, F.R.)). Jun 1984. 155p. (IPF—84-3; IPP—1/299). NTIS, PC A08/MF A01.

A lidar-Thomson scattering system was designed for the Joint European Torus. Spatial resolution of 12 cm is achieved using an iodine laser (15 J at 657 nm, 300 psec pulse duration) with microchannel plate photomultipliers and a 1 GHz oscilloscope. The statistical errors of the electron temperature and density measurements for a 5 channel spectrometer with a dynamic range of 0.7 to 15 keV are smallest at 5 keV (2.6%). The feasibility of 1 Hz operation over a sequence of 10 shots is demonstrated. The design of a 15 J frequency-doubled laser system is considered. The stray light level to be expected was determined in a full scale optical set-up with a low energy, frequency doubled iodine laser. It is shown that stray light constitutes no problem for the Thomson scattering experiments due to the good gating properties of the detector. Even Rayleigh scattering measurements for absolute calibration at 1 Torr hydrogen filling pressure should be possible. (ESA)

32911 (NRCN—518) Implication of various confinement laws on solutions of steady self-burning plasma in Tokamaks. Sapir, M. (Israel Atomic Energy Commission, Beersheba. Nuclear Research Center-Negev). Jun 1983. 57p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85701433.

The behavior of the steady state parameters for self-sustained burning plasma in tokamak reactors was investigated on the basis of various confinement laws. The studies included the trapped-ion-mode, the trapped-electron-modes, the pseudoclassical confinement law, empirical confinement laws and laws with a range of constant confinement times. Specifically, the generated power and refueling rate behavior was determined as a function of temperature and magnetic field for the various confinement laws. Since these solutions can be found only in a limited range of parameters, it is of interest to determine this domain and study its dependence on geometry. In particular the minimum magnetic field which is necessary to achieve a steady self-sustained burning plasma was found as a function of its minor radius and consequently some parameters are suggested for small size tokamak reactors.

32912 **(ORNL/TM—8938) Langmuir probe on ISX-B.** Wootton, A.J.; Yokoyama, K.E.; Edmonds, P.H. (Oak Ridge National Lab., TN (USA)). May 1985. Contract AC05-84OR21400. 22p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012066.

The procedures used to derive temperature and density with a floating probe are documented. The accuracy of a Fourier analysis with restricted terms and the importance of various correction terms in calculating the density from the saturation current are discussed. Methods of reducing errors introduced by circuit resistance and fluctuations are presented.

32913 **(ORNL/TM—9372) Multiple-frequency electron cyclotron heating of hot electron rings in EBT-I.** Rasmussen, D.A.; Bigelow, T.S.; Batchelor, D.B.; Hillis, D.L.; Haste, G.R.; Quon, B.H.; Hankins, O.E. (Oak Ridge National Lab., TN (USA)). May 1985. Contract AC05-84OR21400. 22p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011302.

The use of multiple-frequency microwave power for electron cyclotron heating (MFECH) significantly increased the ring stored energy in the SM-1 simple mirror device. MFECH was used on ELMO Bumpy Torus (EBT) in an effort to increase its hot electron beta. No substantial improvement in the ring parameters was observed in a series of two-frequency ECH experiments, with frequency separations up to 90 MHz, in contrast to the dramatic improvement found in the axisymmetric SM-1 experiment. The absence of superadiabatic behavior by the energetic electrons, combined with the effects of reduced heating efficiency and the additional ring losses introduced by the canting of the EBT mirror sectors, appears to limit the hot electron ring beta.

32914 **(ORNL/TM—9397) Instrument to synchronize Thomson scattering diagnostic measurements with MHD activity in a tokamak.** Wintenberg, A.L. (Oak Ridge National Lab., TN (USA)). Apr 1985. Contract AC05-84OR21400. 139p. NTIS, PC A07/MF A01; 1; GPO Dep. File Number DE85012082.

An instrument to synchronize the firing of a ruby laser for a Thomson scattering diagnostic with plasma oscillations was designed, developed, and evaluated. The instrument will fire the laser at a user-selected phase of an input sine or sawtooth wave with an accuracy of +-15°. Allowable frequencies range from 20 to 500 Hz for a sawtooth and from 1 to 30 kHz for a sine wave. The instrument also allows synchronization with a sine wave to be enabled by a preselected sawtooth phase. The instrument uses analog signal processing circuits to separate the signal components, remove unwanted components, and produce zero-phase synchronization pulses. The instrument measures the period between zero-phase pulses in order to produce phase synchronization pulses delayed a fraction of the period from the zero-phase pulses. The laser is fired by the phase synchronization pulse. Unwanted signal components are attenuated by bandpass filters. A digitally controlled self-adjusting bandpass filter for sine processing. The instrument was used to investigate the variation of the electron temperature profile with the phase of the x-ray signal from an Impurity Studies Experiment (ISX-B) plasma exhibiting magnetohydrodynamic (MHD) activity.

32915 **(ORNL/TM—9399) High-field launch electron cyclotron heating experiments in the ELMO Bumpy Torus.** Rasmussen, D.A.; Batchelor, D.B.; Swain, D.W.; White, T.L.; Kimrey, H.D.; Bigelow, T.S.; Cobble, J.A.; Hillis, D.L.; Richards, R.K.; Uckan, T. (Oak Ridge National Lab., TN (USA)). May 1985. Contract AC05-84OR21400. 46p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012068.

The midplane microwave heating system in the ELMO Bumpy Torus (EBT) was supplemented with power launched from the high-field side of the fundamental resonance by an antenna in the magnet coil throat. Up to 43 kW of polarized (extraordinary mode), 28-GHz power was successfully launched with one antenna. Measurements were made of changes in the core and hot electron ring plasma parameters when throat-launch power was added. In sharp contrast to initial expectations, the bulk core plasma parameters were degraded while the ring parameters, in the launch cavity, were improved. These results are explained in light of a modified picture of electron cyclotron heating (ECH) in EBT. A picture of localized microwave absorption and particle losses is supported by additional measurements.

32916 **(PPPL—2209) Transformation of Hamiltonians to near action-angle form.** Boozer, A.H. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Apr 1985. Contract AC02-76CH03073. 13p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011279.

A classical Hamiltonian would be solved by a transformation to action-angle variables I,θ in which the Hamiltonian is H-bar(I). Generally, such a transformation does not exist, and, at best, the Hamiltonian can be transformed to H-bar(I) + H(I,θ,t) with H being a sum of Fourier terms that resonate with H-bar. We give a set of ordinary differential equations in a parameter ϵ that carry out this transformation as the set is integrated from ϵ equal to zero to one. Although the differential equations can be integrated numerically, approximations give classical perturbation theory.

32917 **(PPPL—2211) Viscous current drive.** Stix, T.H.; Ono, M. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Apr 1985. Contract AC02-76CH03073. 12p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011739.

It is suggested that electron viscosity associated with magnetic turbulence be used to control the current profile or to drive steady-state current in a tokamak. Due to the strongly asymmetric character of the onset condition for an instability such as the double-tearing mode, rapid radial penetration will occur only for properly directed incremental current. This penetration can be modelled by adding a new term to Ohm's law, one which represents the mean-field behavior of the instability-associated turbulence by an anomalous shear viscosity for parallel electron flow.

32918 **(RAL—84-086) Relativistic saturation of 'beat waves'.** Evans, R.G. (Rutherford Appleton Lab., Chilton (UK)). Sep 1984. 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85700991.

Large amplitude Langmuir waves with a phase velocity close to the speed of light may be generated by the beat frequency of two co-propagating laser waves in an underdense plasma. Numerical simulations of the saturation of these waves show that relativistic detuning limits the wave growth but fails to give quantitative agreement with earlier work. Reasons for this disagreement are discussed and the numerical work is found to agree with more recent calculations.

32919 **(SAIC—85/1676-PRI-91) RF stabilization of interchange-ballooning modes.** Myra, J.R.; D'Ippolito, D.A. (Science Applications International Corp., Boulder, CO (USA). Plasma Research Inst.). Apr 1985. Contract AC03-76ET53057. 13p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012080.

A fully electromagnetic theory describing the interaction of radio frequency waves with low frequency curvature driven modes in mirror geometry is presented. The theory includes the direct ponderomotive force terms and sideband mode coupling on an equal footing. Tandem mirror stabilization experiments are discussed with emphasis on what further measurements would enable a more definitive comparison of theory and experiment.

32920 **(UCID—20400) User's manual for the FLORA equilibrium and stability code.** Freis, R.P.; Cohen, B.I. (Lawrence Livermore National Lab., CA (USA)). 1 Apr 1985. Contract W-7405-ENG-48. 22p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013182.

This document provides a user's guide to the content and use of the two-dimensional axisymmetric equilibrium and stability code FLORA. FLORA addresses the low-frequency MHD stability of long-thin axisymmetric tandem mirror systems with finite pressure and finite-larmor-radius effects. FLORA solves an initial-value problem for interchange, rotational, and ballooning stability.

32921 **(UCID—20405) Physics modeling of tandem mirror devices with high-field test cell inserts.** Fenstermacher, M.E.; Campbell, R.B. (TRW, Inc., Redondo Beach, CA (USA); Lawrence Livermore National Lab., CA (USA)). 15 Apr 1985. Contract W-7405-ENG-48. 64p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85011870.

Recently developed plasma physics models of tandem mirror operation with a high-field technology test cell insert in the central cell are described in detail. These models have been incorporated in the TMRBAR tandem mirror reactor physics code. Results of a benchmark case for the code models against previous analysis of the MFTF - α^{+} T configuration are given. A brief users guide to the new TMRBAR with the test cell models is also presented. Some description of the applications of the models to MFTF - α^{+} T and FPD - II + T configurations is made. References are given to separate reports on these studies.

32922 **(UCRL—92532) Perspective on the next ten years in plasma physics.** Killeen, J. (Lawrence Livermore National Lab., CA (USA)). Apr 1985. Contract W-7405-ENG-48. 11p. (CONF-8503105—2). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011849.

From Orbital dynamics and applications to accelerators workshop; Berkeley, CA, USA (7 Mar 1985).

A brief survey of developments in the plasma physics of magnetic fusion research is presented. The major experimental facilities of the next decade are listed. Eight fusion physics issues are identified which must be addressed as a complete plasma system in order to reach the goal of a fusion reactor. In order to resolve the physics issues the results from these new experimental facilities must be augmented by an extensive program of computer modeling. The use of computer models of a magnetically confined plasma and the implementation of these models on the new supercomputers of the next decade are the main topics of this paper.

32923 **Energy and density measurements of sloshing ions in tandem-mirror-experiment upgrade using solid-state probe techniques.** Hsu, W.L.; Bastasz, R.; Wampler, W.R.; Rensink, M.E.; Allen, S.L.; Grubb, D.P.; Simonen, T.C. (Sandia National Laboratories, Livermore, California 94550). *Journal of Applied Physics;* **58**: No. 1, 179-183(1 Jul 1985).

The energy and flux of charge-exchange neutrals from the sloshing ions in the endplug of tandem-mirror-experiment upgrade were measured using solid-state probes. An average energy of the sloshing ions of 6 keV was inferred from the depth profile of deuterium implanted in a silicon sample exposed to the charge-exchange neutrals. A bounce-averaged Fokker—Planck code was used to calculate the sloshing-ion energy distribution. The calculated depth profile of deuterium in the silicon sample resulting from this energy distribution is in good agreement with the measured profile. Carbon resistance probes were used to measure the charge-exchange flux from which the central chord sloshing-ion line density was inferred. The line density of particles with energies$>$2 keV was deduced to account for 60% of the total plasma line density in the endplug. By folding the sloshing-ion line density into the diamagnetic loop data, it was shown that the 1/e radial extent of the sloshing ions remained relatively constant from shot to shot at 14 cm.

32924 **Electron heating by waves in the ion-cyclotron frequency range.** Fruchtman, A. (Courant Institute of Mathematical Sciences, New York University, New York, New York 10012). *Physics of Fluids;* **28**: No. 7, 2188-2193(Jul 1985). Contract AC02-76ER03077.

The interaction between waves in the ion-cyclotron frequency range and a hot-electron ring is studied. The configuration is approximated by a slab geometry in which the hot-electron ring is a few Larmor radii thick, the confining magnetic field is uniform, and the hot-electron distribution function is anisotropic. The wave vector of the incident wave is nearly perpendicular to the magnetic field with a small parallel component, so that both parallel streaming and finite Larmor radius effects are present. It is shown that a significant part of the energy flux may be absorbed by the electrons in a single pass of the wave through the ring. This process may be responsible for the electron ring heating observed in the Elmo Bumpy Torus-S [Nucl. Fusion 23, 49 (1983)] recently. Numerical results of energy absorption and wave transmission are presented for a wide range of parameters. For two special cases, the Born approximation and finite Larmor radius expansions enable us to simplify the analysis. The energy absorption calculated under the approximations is compared with the more exact treatment.

32925 **Numerical simulations of current-limited double layers observed in a linear mirror device.** Inuzuka, H.; Torii, Y.; Tsukishima, T. (Faculty of Engineering, Nagoya University, Nagoya 464, Japan). *Physics of Fluids;* **28**: No. 7, 2106-2115(Jul 1985).

Simulations based on the Vlasov—Poisson scheme are carried out to observe the temporal and spatial development of dopuble layers (DLs) in a linear mirror field. Simulation results show that the magnetic mirrors have a substantial effect in reducing the current passing through the DL. Development of a negative potential region on the low potential side of the DL is also observed, in agreement with the experimental results. The observed strong DLs appear to be formed, triggered by the ion-acoustic instability.

32926 **Theory of resistivity-gradient-driven turbulence.** Garcia, L.; Diamond, P.H.; Carreras, B.A.; Callen, J.D. (Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831). *Physics of Fluids;* **28**: No. 7, 2147-2158(Jul 1985).

A theory of the nonlinear evolution and saturation of resistivity-driven turbulence, which evolves from linear rippling instabilities, is presented. The nonlinear saturation mechanism is identified both analytically and numerically. Saturation occurs when the turbulent diffusion of the resistivity is large enough so that dissipation caused by parallel electron thermal conduction balances the nonlinearly modified resistivity gradient driving term. The levels of potential, resistivity, and density fluctuations at saturation are calculated. A combination of computational modeling and analytic treatment is used in this investigation.

32927 **Simulation of the ion-beam-driven drift instability in a magnetic trap. I.** Thomas, V.A.; Nevins, W.M.; Chen, Y.J. (Electronics Research Laboratory, University of California, Berkeley, California 94720). *Physics of Fluids;* **28**: No. 7, 2235-2247(Jul 1985).

Recent experiments on the TMX-U device, at the Lawrence Livermore National Laboratory have indicated the possibility of a drift wave being driven unstable by the injection of neutral beams in the thermal barrier region. A review of linear theory is presented in the local approximation. In addition, particle simulations are used to understand the nonlinear characteristics of this instability. The particle simulations are performed using 1d-3v and 2d-3v electrostatic particle simulation codes. The instability is shown to saturate by beam trapping, nonlinear electron effects, and nonlinear motion parallel to the density gradient. Resonant E x B motion is a significant process for some of the beam particles. This process is closely associated with the trapping of beam ions. Harmonic generation is also observed, as appears in some of the experimental data. Qualitative nonlinear theory is presented in support of the particle simulations.

32928 **Nonlinear resistive helical states in reversed-field pinches.** Dagazian, R.Y. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physics of Fluids;* **28**: No. 7, 2209-2218(Jul 1985).

Time-independent nonlinear states resulting from resistive modes with helical symmetry are shown to exist in reversed-field pinch configurations. The importance of flow effects in such states is demonstrated, and the nonlinear redistribution of magnetic flux caused by the presence of the deformation is discussed.

32929 **Microstability properties of the sheath region of a field-reversed configuration.** Gladd, N.T.; Sgro, A.G.; Hewett, D.W. (JAYCOR, San Diego, California 92138). *Physics of Fluids;* **28**: No. 7, 2222-2234(Jul 1985).

An analysis of the microstability properties of the sheath region of a field-reversed configuration is performed. Attention is focused on the lower-hybrid-drift instability, a mode known to be important in devices with similar parametric conditions. This mode is thought to play a significant role in determining the confinement properties of a field-reversed configuration. Specifically, a model profile characteristic of the sheath region is constructed and analyzed in detail, both theoretically, by means of a nonlocal kinetic theory, and computationally, by means of a hybrid simulation technique. The lower-hybrid-drift is found to be unstable under typical sheath conditions. The theoretically predicted growth rate and the variation of the growth rate with wavenumber is found to be in good agreement with the growth characteristics deduced from the simulation. By means of the hybrid simulation technique, the lower-hybrid-drift has been simulated at drift velocities as low as 0.2v/sub i/ with m/sub i//m/sub e/ = 100 and 0.3v/sub i/ with m/sub i// m/sub e/ = 3672.

32930 Characterization of laboratory plasmas with probes. Manos, D.M. (Princeton Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1059-1066(May 1985).

This paper presents a broad overview of various types of probes employed to study plasmas produced in laboratory environments. Methods reviewed include single, double, and triple Langmuir probes, biased calorimeters, E x B, RFA, momentum discriminating, and sample exposure probes.

32931 Plasma-edge studies using carbon resistance probes. Wampler, W.R. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1067-1073(May 1985). Contract AC04-76DP00789.

Characterization of erosion and hydrogen-recycling processes occurring at the edge of magnetically confined plasmas requires knowledge of the energy and flux of hydrogen isotopes incident on the materials. A new plasma-edge probe technique, the carbon resistance probe, has been developed to obtain this information. This technique utilizes the increase in electrical resistance caused in thin carbon films by energetic particle bombardment to characterize the flux and energy of the incident ions and neutrals. The method is relatively easy to implement and gives data in real time. Energy resolution of low dose exposures has been achieved using thin insulating films over the carbon. Calibrations using ion implantation show that the particle energies and fluxes which can be measured with resistance probes are well matched to those typically encountered near the wall in plasma devices. This paper describes the experimental technique and the model used to relate the measured resistance changes to the energy and flux of particles. Experiments are then described in which resistance probes were used to study energetic particles in the PLT and TEXTOR tokamaks and the TMX-U tandem mirror.

32932 Far-infrared laser scattering in the ACT-I toroidal device. Goree, J.; Mansfield, D.K.; Ono, M.; Wong, K.L. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1074-1076(May 1985). Contract AC02-76CH03073.

A far-infrared laser scattering diagnostic has been built for the ACT-I toroidal device. The optical system uses a passively stabilized 447-μm CH_3I laser. A polyethylene etalon is the beam splitter. The vacuum windows are plastic (TPX), which we found has the vacuum property Q 6.5 x 10^{-9} Torr l/s/cm^2. Using paraboloidal and ellipsoidal mirrors for detection optics improves the signal strength and allows a better rf enclosure design for the detector. The diagnostic was tested by scattering from an ion Bernstein wave, a technique which can be used for ion temperature diagnostics.

32933 Simulation of bent crystal spectrometers. Kyrala, G.A. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Review of Scientific Instruments;* **56**: No. 5, 815-817(May 1985).

In crystal spectrometers one traditionally labels each position in the dispersion/recording plane by a single wavelength value. A simple examination of the crystal spectrometers shows that different areas of the crystal contribute different wavelengths at the same position in the recording plane. Using collimators and apertures one may reduce these effects, as well as reduce the collected signal. Convolving the system response, in that case, may not allow simple analytic estimates of the sensitivity/responsivity of the system. A Monte-Carlo ray-trace program was written in order to study and simulate the real geometry including finite-source size effects. The results of the code are presented, demonstrating the contributions to the resolution and absolute responsivity, for a particular parabolically bent crystal spectrometer.

32934 Ultrafast turnoff laser triggered gating system for microchannel-plate intensified x-ray spectrometers. Christie, D.J.; Nilson, D.G.; Wiedwald, J.D.; Wilcox, R.B. (University of California, Lawrence Livermore National Laboratory (LLNL), P. O. Box 5508, Livermore, California 94550). *Review of Scientific Instruments;* **56**: No. 5, 818-820(May 1985).

A laser triggered photoconductive switch based microchannel-plate (MCP) gating system has been developed. The gating pulse provided to the MCP has a fall time on the order of 200 ps. Use of this system has resulted in increased signal-to-noise ratio on three MCP intensified x-ray spectrometers during recent x-ray experiments at the Novette laser facility. The x-ray signals of interest have a duration of approximately 300 ps while background in the same spectral region continues for several nanoseconds. As a result, signal-to-noise ratio is maximized by turning the MCP off just after the signals of interest are recorded. The MCP's are turned on by charging to approximately 1 kV with a slow rise-time (500 ns) pulse and rapidly gated off by a photoconductive switch connected to the MCP through transmission lines. Staggering the turnoff times of three microstrip lines across the MCP by 250 ps provides some time resolution. Details of the system, including pulse charging system, trigger beam delivery optics, and system diagnostics will be discussed.

32935 Time-integrated x-ray measurements of the very energetic electron end loss profile in TMX-U. Osher, J.E.; Fabyan, J. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Review of Scientific Instruments;* **56**: No. 5, 824-826(May 1985).

The time-integrated 2D profile of the thick-target bremsstrahlung produced by energetic end loss electrons has been measured during electron cyclotron resonance heating (ECRH) operation of TMX-U. Sheets of x-ray film and/or arrays of thermoluminescent dosimeters were placed on the outside of the end tank end wall to measure the relative spatial x-ray profile, with locally added filters of Pb to determine the effective mean x-ray energy. The purpose of this simple survey diagnostic was to allow deduction of the gross features of the ECRH region. The electron source functions needed to fit the x-ray data were modeled for various anchor cell radial distributions mapped along magnetic field lines to the elliptical plasma potential control plates or the Al end walls. The data are generally consistent with (1) major ECR heating in the central 25-cm-diameter core, (2) a mean ECRH electron-loss energy of 420 keV, and (3) and ECRH coupling efficiency to these hot electrons of > or =10%.

32936 Fast multichannel electron temperature diagnostic for TFTR using x-ray imaging. Kiraly, J.; Bitter, M.; Goeler, S.v.; Hill, K.W.; Johnson, L.C.; McGuire, K.; Sesnic, S.; Sauthoff, N.R.; Tenney, F.; Young, K.M. (Princeton University, Plasma Physics Laboratory, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **56**: No. 5, 827-829(May 1985).

The TFTR x-ray imaging system (XIS) is an array of 64-Si surface barrier diodes which image the plasma poloidally. Special absorber foils have been installed to permit measurement of electron temperature T/sub e/ with <100-μs time resolution along 10—30 chords. The technique uses the ratio of x-ray fluxes transmitted through two different foils, which depend mainly on T/sub e/. Simulations show that strong line radiation can change this ratio. To correct for these effects, special beryllium—scandium filters are employed to select the line-free region between 2 and 4.5 keV. Separate filter pairs allow correction for strong L line radiation as well as Ti or Ni Kα emission. The T/sub e/ determination is based on simulations. Comparison of results with T/sub e/ values from the electron—cyclotron emission and x-ray pulse height analysis diagnostics is presented.

32937 **Microchannel plate streak camera.** Wang, C.L.; Medecki, H.; Hale, C.P.; Leipelt, G.R.; Thomas, S.W.; Wiedwald, J.D. (Fusion Experiments Program, Lawrence Livermore National Laboratory, P. O. Box 5508, Livermore, California 94550). *Review of Scientific Instruments;* **56**: No. 5, 835-836(May 1985).

The development of a streak camera using a microchannel plate electron multiplier as the cathode is presented. Potential applications to γ-rays, low-energy x-rays, and charged particles are described. Preliminary test shows that 150-ps resolution can be obtained.

32938 **Tokamak Fusion Test Reactor horizontal high-resolution Bragg x-ray spectrometer (abstract).** Hill, K.W.; Bitter, M.; Tavernier, M.; Diesso, M.; von Goeler, S.; Johnson, G.; Johnson, L.C.; Sauthoff, N.R.; Schechtman, N.; Sesnic, S.; Tenney, F.; Young, K.M. (Princeton University, Plasma Physics Laboratory, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **56**: No. 5, 848-848(May 1985).

A bent quartz-crystal spectrometer of the Johann type with a spectral resolution of $\lambda/\Delta\lambda = 10000—25000$ is used on the Tokamak Fusion Test Reactor (TFTR) to determine central plasma parameters from the spectra of helium-like and lithium-like metal impurity ions (Ti, Cr, Fe, and Ni). The spectra are observed along a central radial chord and are recorded by a position-sensitive multiwire proportional counter with a spatial resolution of 250 μ. Standard delay-line time-difference readout is employed. The data are histogrammed and stored in 64 K of memory providing 128 time groups of 512-channel spectra. The central ion temperature and the toroidal plasma rotation are inferred from the Doppler broadening and Doppler shift of the Kα lines. The central electron temperature, the distribution of ionization states, and dielectronic recombination rates are obtained from satellite-to-resonance line ratios. The performance of the spectrometer is demonstrated by measurements of the Ti XXI Kα radiation.

32939 **Study of impurity radiation on the PLT and TFTR tokamaks with high-resolution, time-resolving spectrometers.** Wouters, A.W.; Schwob, J.L.; Suckewer, S.; Boody, F.P.; Hulse, R.; Schivell, J. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **56**: No. 5, 849-851(May 1985).

Soft-x-ray (5—300 A) spectra of intrinsic impurities have been recorded with a high-resolution multichannel XUV spectrometer (SOXMOS). Measurements of line intensity ratios as a function of time are applied to the determination of the impurity contribution to the energy balance. Results from TFTR Ohmic heated plasmas, including radiation due to carbon, oxygen, iron, nickel, chromium, titanium, and zirconium, are presented. The spatial ion distribution will be directly observed by a radial scanning spectrometer (FLOPSY). This instrument, under construction, will cover the spectral range from 1500 to 7000 A and use mirrors and lenses for fast scanning. The spatial ion distribution, deduced from forbidden and allowed lines, will be compared to both theoretical models based on impurity concentrations and transport coefficients, as well as experimental data from bolometer measurements.

32940 **Magnetic field measurements based on the Zeeman splitting of forbidden transitions.** Seely, J.F.; Feldman, U.; Sheeley N.R. Jr.; Suckewer, S.; Title, A.M. (E. O. Hulburt Center for Space Research, Naval Research Laboratory, Washington, D.C. 20375-5000). *Review of Scientific Instruments;* **56**: No. 5, 855-856(May 1985).

The measurement of the poloidal magnetic field in a tokamak plasma from the Zeeman splitting and polarization of the magnetic dipole radiation from heavy ions is discussed. When viewed from a direction perpendicular to the toroidal field, the effect of the poloidal field on the circularly polarized radiation is detectable using a photoelectric polarimeter.

32941 **Charge exchange recombination spectroscopy measurements of ion temperature and plasma rotation in PBX.** Jaehnig, K.P.; Fonck, R.J.; Ida, K.; Powell, E.T. (Princeton University, Plasma Physics Laboratory, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **56**: No. 5, 865-867(May 1985).

The primary diagnostic on PBX for ion temperature measurements is charge exchange recombination spectroscopy of low Z ions, wherein fast neutrals from the heating neutral beams excite spectral lines from highly excited states ($n>4$) of hydrogenic O, C, and He via charge exchange collisions with the respective fully stripped ions. Since the neutral beams on PBX provide relatively low-velocity neutrals (i.e., D^0 beams at 44 keV), best signals are obtained using the near-UV lines of O^{7+} (e.g., $n = 8—7$, 2976 A). Off-line analysis of the Doppler broadened and shifted line profiles includes nonlinear least-squares fitting to a model line profile, while a simplified on-line fast analysis code permits between-shot data analysis.

32942 **Four-frame holographic probing system for plasma density measurement (invited).** Busch; Shepard, C.L.; Siebert, L.D.; Tarvin, J.A. (KMS Fusion, Inc., 3621 South State Road, P. O. Box 1567, Ann Arbor, Michigan 48106-1567). *Review of Scientific Instruments;* **56**: No. 5, 879-884(May 1985).

An important upgrade of UV holographic interferometry is now in use. Many hundreds of laser fusion-type target plasmas have been probed at KMS Fusion, Inc. using the holographic technique. The data obtained with this diagnostic include high-resolution images and plasma electron density distributions at various probe times. The diagnostic system now produces a sequence of four interferograms of an evolving plasma. The times of the 20-ps pulses in the sequence are fully adjustable and known within 10 ps. The experiments to which this diagnostic has been adapted will be described along with details of problems and their solutions. Selected sets of recent interferograms of plasmas produced by irradiation of thin foils will be presented along with their inversions.

32943 **Charge exchange recombination spectroscopy as a plasma diagnostic tool (invited).** Fonck, R.J. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **56**: No. 5, 885-890(May 1985).

Intensity and line profile measurements of the spectra of light hydrogenic ions which are excited by charge exchange reactions with fast neutral atoms are being widely used as diagnostics for fusion plasma research. This technique, which is referred to as charge exchange recombination spectroscopy, allows measurements of the densities of fully stripped impurity ions and particle transport coefficients with only minor uncertainties arising from atomic processes. The excitation of long-wavelength transitions in light ions such as He^+, C^{6+}, and O^{7+} allows relatively easy measurements of ion velocity distributions to determine ion temperatures and plasma rotation velocities. Among its advantages for such measurements are the facts that fiber-optic coupling between a remote spectrometer and the immediate reactor environment is possible in many cases, the measurement is localized by the intersection region of a neutral beamline and viewing sightline, and intrinsic ions can be used so that injection of potentially perturbing impurities can be avoided. A particularly challenging application of this technique lies in the diagnosis of alpha particles expected to be produced in the present generation of Qroughly-equall tokamak experiments.

32944 **Electron cyclotron emission diagnostics for mirror devices (invited).** Ellis, R.F.; James, R.A.; Lasnier, C.J.; Casper, T. (University of Maryland, College Park, Maryland 20742). *Review of Scientific Instruments;* **56**: No. 5, 891-895(May 1985).

Electron cyclotron emission (ECE) has proven to be a useful diagnostic in tokamaks for measuring T/sub e/ and its radial variation. The application of ECE to mirror devices is discussed here, with emphasis on measurements of the properties of energetic electrons in tandem mirror end cells, which can be viewed both parallel and perpendicular to B. The parallel or whistler view is generally optically thick and can yield a measurement of perpendicular temperature. High harmonic perpendicular emission is optically thin and can yield important information about the hot electron buildup and the energy and spatial distribution. Experimental results from TMX-U and appropriate modeling are presented.

32945 **Far-infrared imaging of tokamak plasma.** Young, P.E.; Luhmann N.C. Jr.; Taylor, R.J.; Neikirk, D.P.; Rutledge, D.B. (University of California, Los Angeles, California 90024). *Review of Scientific Instruments;* **56**: No. 5, 903-904(May 1985).

A 20-channel interferometer has been developed which utilizes a linear, one-dimensional microbolometer array to obtain single-shot density profiles from the UCLA Microtor tokamak plasma. The interferometer has been used to study time-dependent phenomena in the plasma density profile. Observations of the sawtooth instability clearly show the growth of the m = 0 mode from a localized oscillation (r = 1 cm) on axis to an oscillation of the entire plasma. Also, measurements during the initial startup phase of the discharge show evidence of hollow density profiles. In addition, a simultaneous measurement of the poloidal magnetic field has been developed which provides 20 channels of polarimetry. Interferometry and polarimetry both use the same imaging system and the spatial resolution of both measurements has been tested using plastic and crystal-quartz test objects. The signal-to-noise ratio for the polarimeter has also proved adequate for the expected Faraday rotation angle (α/sub max/ = 7^0, I/sub p/ = 70 kA, n = 5 x 10^{13} cm^{-3}).

32946 **CO_2 laser interferometer array for Big Dee.** Fairbanks, E.S. (GA Technologies Incorporated, P. O. Box 85608, San Diego, California 92138). *Review of Scientific Instruments;* **56**: No. 5, 905-907(May 1985).

A 12 channel interferometer array is planned for obtaining electron density profiles on Big Dee. Each channel consists of coaxial CO_2 and HeNe laser beams. The reference beam is formed by splitting off half of the laser power at each wavelength by using acousto-optic modulators which introduce a 40-MHz frequency shift in the reference beam. The detected interference signals from room-temperature visible and IR detectors are mixed with the 40-MHz drive for the acousto-optic cells. The quadrature mixer signals result in phase information due to vibration and phase-velocity variation in the plasma. Simultaneous solution of the two equations describing the phase shift at the two wavelengths yields the phase shift due only to the plasma effects. The arithmetic operations will be performed digitally in real time by a dedicated microprocessor in each channel. The execution speed of the microprocessor is expected to be sufficient for measuring line integral density in the presence of vibrations of 1-mm amplitude at 1 Hz or 10-μm amplitude at 100 Hz. Phase resolution for each channel is $2\pi/64$ and time between samples is 25 μs. Density profiles are derived from chordal line integral density data by computer tomography.

32947 **High-frequency gyrotron scattering diagnostic for instability studies on TARA.** Woskoboinikow, P.; Cohn, D.R.; Gerver, M.; Mulligan, W.J.; Post, R.S.; Temkin, R.J.; Trulsen, J. (MIT Plasma Fusion Center, Cambridge, Massachusetts 02139). *Review of Scientific Instruments;* **56**: No. 5, 914-916(May 1985).

A 1- to 10-kW,>30-ms pulsed, narrow linewidth (<1 MHz), 137-GHz gyrotron is being fabricated for collective Thomson scattering plasma diagnostics on the TARA tandem mirror experiment. The drift cyclotron loss cone, the axial loss cone, harmonics of these instabilities, and the ion two stream instability in the TARA plugs will be studied with this diagnostic.

32948 **Far-infrared laser diagnostic on ELMO Bumpy Torus and extreme far-forward laser scattering on the Impurity Study Experiment.** Casson, W.H.; Hutchinson, D.P.; Ma, C.H.; Staats, P.A.; Wilgen, J.B. (University of Tennessee, Knoxville, Tennessee 37916). *Review of Scientific Instruments;* **56**: No. 5, 917-918(May 1985).

A far-infrared (FIR) laser scattering diagnostic has been installed on the ELMO Bumpy Torus (EBT) experiment, and tests conducted on the system using a TPX Bragg cell show that the system is fully functional. Scattering experiments to date have shown only small detectable signal levels during normal operation and during ion cyclotron heating (ICH) fast-wave and slow-wave propagation experiments. On the Impurity Study Experiment (ISX), the output signal from the rf amplifiers of the FIR interferometer has been spectrum analyzed and shows frequency-shifted sidebands that correspond to extreme far-forward scattering of the laser beam as it passes through the plasma. Although the scattered signal cannot be resolved spatially, the scattered intensity provides information about density fluctuation levels and MHD activity during different modes of operation. Agreement has been found with measurements made by the x-ray diagnostic and the heavy-ion beam probe.

32949 **Fast scanning heterodyne receiver for the measurement of the time evolution of the electron temperature profile on the Tokamak Fusion Test Reactor.** Taylor, G.; Efthimion, P.C.; McCarthy, M.; Fredd, E.; Goldman, M.A.; Kaufman, D. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **56**: No. 5, 928-930(May 1985).

Two fast scanning heterodyne receivers, swept between 75—110 and 110—170 GHz in 2 ms every 4 ms, were developed to measure the electron cyclotron emission on the horizontal midplane of the Tokamak Fusion Test Reactor (TFTR) plasma. An absolute, in situ calibration technique enables the determination of the profile of the plasma electron temperature from the fundamental ordinary mode and second harmonic extraordinary mode cyclotron emission intensity, with an accuracy of better than 10%. Temperature measurements made with the scanning receivers agree well with data from laser TV Thomson scattering and x-ray pulse-height analysis measurements. The time evolution of the temperature profile during temperature sawteeth fluctuations is well documented when the period of the fluctuation (30—100 ms) is much longer than the instrument sweep repetition time.

32950 **Absolute calibration of a ten-channel grating polychromator for electron temperature measurements on Princeton large torus.** Cavallo, A.; Cutler, R. (Princeton University, Princeton Plasma Physics Laboratory, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **56**: No. 5, 931-933(May 1985).

It has been possible to calibrate absolutely the ten-channel grating polychromator installed on PLT (Princeton large torus). Radiation from a blackbody source (eccosorb at liquid-nitrogen temperature) was chopped at 275 Hz and the signal detected using a lock-in amplifier with an integration time constant set at 125 s. A cascade of six grating filters was used to eliminate higher-order radiation from the input to the instrument. Each channel could be calibrated in approximately 2 h; under these conditions the rms calibration signal to noise for a typical channel is about 60.

32951 **Perpendicular electron cyclotron emission from hot electrons in TMX-U.** James, R.A.; Ellis, R.F.; Lasnier, C.J.; Casper, T.A.; Celata, C.M. (University of Maryland, College Park, Maryland 20742). *Review of Scientific Instruments;* **56**: No. 5, 934-936(May 1985).

Perpendicular electron cyclotron emission (PECE) from the electron cyclotron resonant heating of hot electrons in TMX-U is measured at 30—40 and 50—75 GHz. This emission is optically thin and is measured at the midplane, f/sub ce/≈14 GHz, in either end cell. In the west end cell, the emission can be measured at different axial positions thus yielding the temporal history of the hot electron axial profile. These profiles are in excellent agreement with the axial diamagnetic signals. In addition, the PECE signal level correlates well with the diamagnetic signal over a wide range of hot electron densities. Preliminary results from theoretical modeling and comparisons with other diagnostics are also presented.

32952 **Magnetic diagnostics and feedback control on TFTR (invited).** Coonrod, J.; Bell, M.G.; Hawryluk, R.J.; Mueller, D.; Tait, G.D. (Princeton University, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **56**: No. 5, 941-946(May 1985).

The various operating modes of TFTR require the use of a sophisticated system of magnetic diagnostics integrated with a feedback control system. This system has successfully controlled the plasma current and position over a range of major and minor radii, during strong compression, and will soon be used during intense neutral beam heating. Current and position values are held constant to within 2 kA and 1 cm. A wide variety of preoperational field measurements were required to determine proper compensation for dynamic stray fields due to eddy currents. Data from plasma profile diagnostics, such as bolometer arrays, Thomson scattering, soft x-ray diode array, and the scanning radiometer, have been compared to the absolute position deduced from magnetics. In addition to control functions, magnetic diagnostics on TFTR provide data on plasma current asymmetry, β/sub theta/, MHD fluctuations, loop voltage, and flux consumption. This paper will discuss the mechanical and electronic design constraints, as well as the analytic and calibration techniques required.

32953 Plasma potential formation and measurement in TMX-U and MFTF-B (invited). Grubb, D.P. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Review of Scientific Instruments;* **56**: No. 5, 947-952(May 1985).

Tandem mirrors control the axial variation of the plasma potential to create electrostatic "plugs" that improve the axial confinement of central cell ions and, in a thermal barrier tandem mirror, control the electron axial heat flow. Measurements of the spatial and temporal variations of the plasma potential are, therefore, important to the understanding of confinement in a tandem mirror. In this paper we discuss potential formation in a thermal barrier tandem mirror and examine the diagnostics and data obtained on the TMX-U device, including measurements of the thermal barrier potential profile using a diagnostic neutral beam and charged-particle energy spectroscopy. We then describe the heavy ion-beam probe and other new plasma potential diagnostics that are under development for TMX-U and MFTF-B.

32954 Application of optical phase conjugation to plasma diagnostics (invited). Jahoda, F.C.; Anderson, B.T.; Forman, P.R.; Weber, P.G. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Review of Scientific Instruments;* **56**: No. 5, 953-957(May 1985).

Several possibilities for plasma diagnostics provided by optical phase conjugation and, in particular, self-pumped phase conjugation in barium titanate ($BaTiO_3$) are discussed. These include placing a plasma within a dye laser cavity equipped with a phase conjugate mirror for intracavity absorption measurements, time differential refractometry with high spatial resolution, and simplified real-time holographic interferometry. The principles of phase conjugation with particular reference to photorefractive media and the special advantages of self-pumped phase conjugation are reviewed prior to the discussion of the applications. Distinctions are made in the applications between those for which photorefractive conjugators are essential and those for which they only offer experimental simplification relative to other types of phase conjugators.

32955 Phaedrus diagnostic system. Breun, R.; Brouchous, D.; Ferron, J.; Golovato, S.; Hershkowitz, N.; Pew, J.; Brooker, P.; Persing, H.; Ross, S.; Sing, D. (Nuclear Engineering Department, University of Wisconsin-Madison, Madison, Wisconsin 53706). *Review of Scientific Instruments;* **56**: No. 5, 958-959(May 1985).

The Phaedrus diagnostic system makes optimum use of probes and miniature gridded energy analyzers to measure detailed parameters such as density, plasma potential, and electron and ion energy. This requires miniaturization and provision for flexible access. Other diagnostics are made as flexible as possible. A multiple-aperture, end-loss analyzer is rotatable, allowing complete mapping of the end wall loss contours. Self-emissive probes are used to measure plasma potential contours in the end plugs. A single-channel neutral energy analyzer is movable and can be swept in energy. Secondary emission detector arrays supplement the neutral energy analyzer and give a measure of the ion energy versus pitch angle. Calibrated diamagnetic loops are used to measure the total plasma energy and its axial extent in each cell. Both permanent and insertable fast ion gauges are available. Completing the diagnostic system is a computerized data-acquisition system that is flexible and receptive to the time varying demands of the many ongoing experiments.

32956 TARA diagnostic set. Sevillano, E.; Brau, K.; Goodrich, P.; Irby, J.; Mauel, M.; Post, R.S.; Smith, D.K.; Sullivan, J. (Plasma Fusion Center, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Review of Scientific Instruments;* **56**: No. 5, 960-962(May 1985).

The TARA Tandem Mirror Experiment has recently begun operation. The set of diagnostics available at this time is discussed. The following diagnostics are now in use: diamagnetic loops, a multichord microwave interferometer, Langmuir and emissive probes, pick-up loops, and secondary-emission detectors. End-loss diagnostics include net current detector arrays, Faraday cup arrays, swept particle analyzer arrays, and calorimetry. Light-emission measurements are made in the visible and VUV regions. A multichord fiber-optic array for plasma position detection is also used. In addition, a three-channel charge exchange analyzer, a hard x-ray system, and fast pressure gauges are available.

32957 TFTR diagnostic control and data acquisition system. Sauthoff, N.R.; Daniels, R.E.; PPL Computer Division. (Princeton University, Plasma Physics Laboratory, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **56**: No. 5, 963-965(May 1985).

General computerized control and data-handling support for TFTR diagnostics is presented within the context of the Central Instrumentation, Control and Data Acquisition (CICADA) System. Procedures, hardware, the interactive man—machine interface, event-driven task scheduling, system-wide arming and data acquisition, and a hierarchical data base of raw data and results are described. Similarities in data structures involved in control, monitoring, and data acquisition afford a simplification of the system functions, based on "groups" of devices. Emphases and optimizations appropriate for fusion diagnostic system designs are provided. An off-line data reduction computer system is under development.

32958 Fusion gamma diagnostics. Medley, S.S.; Cecil, F.E.; Cole, D.; Conway, M.A.; Wilkinson F.J. III. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **56**: No. 5, 975-977(May 1985).

Nuclear reactions of interest in fusion research often possess a branch yielding prompt emission of gamma radiation in excess of 15 MeV which can be exploited to provide a new fusion reaction diagnostic having applications similar to conventional neutron emission measurements. Conceptual aspects of fusion gamma diagnostics are discussed with emphasis on application to the Tokamak Fusion Test Reactor (TFTR) during deuterium neutral beam heating of D—T and D—^{3}He plasmas. Recent measurements of the D (T, $\gamma)^5$He, D(^{3}He, $\gamma)^5$Li, and D(D, $\gamma)^4$He branching ratios at low center-of-mass energy (30—100 keV) and of the response of a large volume Ne226 detector for gamma detection in high neutron backgrounds are presented. Using a well-shielded Ne226 detector during 20 MW—120 kV deuterium beam heating of a tritium plasma in TFTR, the D(T, $\gamma)^5$He gamma signal level is estimated to be 3.5×10^5 cps.

32959 Tandem-Mirror Experiment-Upgrade neutral pressure measurement diagnostic systems. Pickles, W.L.; Allen, S.L.; Hill, D.N.; Hunt, A.L.; Simonen, T.C. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Review of Scientific Instruments;* **56**: No. 5, 978-980(May 1985).

The Tandem-Mirror Experiment-Upgrade (TMX-U) has a large and complex system of Bayard—Alpert, magnetron, and Penning gauges, in addition to mass spectrometers (RGA), all of which measure neutral pressures in the many internal regions of TMX-U. These pressure measurements are used as part of the confinement physics data base as well as for management of the TMX-U vacuum system. Dynamic pressures are modeled by a coupled-volumes simulation code, which includes wall reflux, getter pumping, and plasma pumping.

32960 Determination of experimental tokamak plasma profiles using maximum-entropy analysis. Cottrell, G.A.; Fairbanks, E.S.; Stockdale, R.E. (GA Technologies Incorporated, P. O. Box 85608, San Diego, California 92138). *Review of Scientific Instruments;* **56**: No. 5, 984-986(May 1985).

The diagnostician commonly faces the problem of extracting the maximum information on plasma spatial profiles from only a very limited and noisy data set. Conventionally, functional forms (e.g., a parabola raised to a power) are fitted to the measured data using nonlinear least-squares regression. This immediately biases the interpretation and constrains results to a narrow family of curves for which there may be no real evidence in the data. In this paper, we examine the consequences of abandoning this assumption and, instead, seek the constrained maximum entropy (ME) profile making no such assumptions. Results are compared with conventional analysis. The ME method has the inherent advantages of (i) yielding only positive (and therefore physically meaningful) profiles, (ii) suppression of noise on the data, and (iii) producing a profile which contains the least amount of spurious detail. The method is illustrated with reference to measured chord-average CO_2 laser interferometer data taken on the Doublet III tokamak.

32961 Neutron streak camera electron gun design. Close, E.R.; Colonias, J.S. (Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Review of Scientific Instruments;* **56**: No. 5, 990-992(May 1985).

Representative values for electrode voltages, time compensation, and transmission efficiency are obtained by computer simulation for a preliminary design of an electron gun to be used in a neutron streak camera application. The calculations indicate a time resolution on the order of 20 ps and a transmission efficiency of about 10%.

32962 Impurity monitoring by laser-induced fluorescence techniques (invited). Gelbwachs, J.A. (Chemistry and Physics Laboratory, The Aerospace Corporation, P.O. Box 92957, Los Angeles, California 90009). *Review of Scientific Instruments;* **56**: No. 5, 1000-1005(May 1985).

Laser-induced fluorescence spectroscopy can provide a highly sensitive and selective means of atomic and ionic impurity detection. Because the photodetector can be physically isolated from the laser-excited region, these techniques can be applied to monitoring in hostile environments. The basic concepts behind fluorescence detection are reviewed. Saturated optical excitation is shown to maximize impurity atom emission yield while mitigating effects of laser intensity fluctuations upon absolute density calibration. A comparison of monitoring in high- and low-pressure monitoring environments is given. Methods to improve detection sensitivity by luminescence background suppression are presented.

32963 TFTR Thomson scattering system. Johnson, D.; Dimock, D.; Grek, B.; Long, D.; McNeill, D.; Palladino, R.; Robinson, J.; Tolnas, E. (Princeton Plasma Physics Laboratory, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **56**: No. 5, 1015-1017(May 1985).

The TFTR Thomson scattering system has been operational since January 1984. The diagnostic uses two ruby lasers and two spectrometer-detector systems to provide profiles at two times in a discharge. The two scattering lines consist of 76 spatial channels which span the 200-cm vacuum vessel along a major radius. The detectors are gated, intensified CCD arrays with single photoelectron sensitivity. T/sub e/(R) and N/sub e/(R) profiles are presented.

32964 Evolution of low-density Thomson scattering on ELMO Bumpy Torus. Cobble, J.A. (Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831). *Review of Scientific Instruments;* **56**: No. 5, 1018-1020(May 1985).

The ELMO Bumpy Torus (EBT) confines a low-density, steady-state, microwave-driven plasma. On the basis of favorable initial diagnostic results, major machine upgrades: increases in microwave power and magnetic field: were initiated, and the feasibility of Thomson scattering was considered. From the time of the first laser measurements, in which a two-point spectrum was integrated during 30 or more Q-switched pulses, the Thomson scattering system has evolved into a reliable diagnostic tool that is able to obtain scans along 20 cm of the plasma diameter and to determine the central electron temperature at densities as low as 2 x 10^{11} cm^{-3}. Based on a 25-J ruby laser and a seven-channel polychrometer, the present system (1) reveals a bulk plasma with T/sub e/ = 20—100 eV and n/sub e/ = 5—10 x 10^{11} cm^{-3} and (2) indicates a suprathermal tail consistent with x-ray measurements. With up to 200 kW of microwave power inside the machine, major problems to overcome were radiation damage to optical materials (< or =3000 R/h) and plasma coating of windows and dumps.

32965 Development and application of multichannel collective scattering systems. Park, H.; Brower, D.L.; Peebles, W.A.; Luhmann N.C. Jr.; Savage R.L. Jr.; Yu, C.X. (University of California, Los Angeles, California 90024). *Review of Scientific Instruments;* **56**: No. 5, 1055-1056(May 1985).

The numerous applications of cw collective Thomson scattering in fusion plasmas are greatly enhanced by the addition of a multichannel capability. This permits the determination of the dispersive properties (ω vs k) of waves on a single tokamak discharge. This paper describes the development, calibration, and application of such systems in the far-infrared spectral region. The measurement of the wave dispersion of externally excited ion Bernstein waves leads to the determination of ion temperature in a tokamak plasma. In addition, the study of naturally occurring microturbulence has produced a series of unique observations which has both motivated theoretical effort and clarified the role of density fluctuations in anomalous transport.

32966 Detector development for γ-ray diagnostics of D-T fusion reactions. Moran. (Lawrence Livermore National Laboratory, University of California, P.O. Box 808, Livermore, California 94550). *Review of Scientific Instruments;* **56**: No. 5, 1066-1068(May 1985).

The development of D-T fusion-energy sources requires intimate and precise measurement of fusion-burn conditions in reactor-development experiments. Some of the limitations inherent in presently available diagnostics based on massive particle emissions can be overcome by measuring fusion-generated high-energy γ rays. Although γ-ray intensities are low, γ rays offer diagnostic advantages of dispersion-free propagation and low intrinsic backgrounds. This paper describes two detector systems developed to study D-T fusion reactions by measuring the associated 16.7-MeV γ-ray emissions. The first system is a Compton-recoil spectrometer and features good energy resolution of the 16.7-MeV photons. This system uses a sector-magnet spectrometer to isolate electrons forward scattered by the high energy γ rays. The second system is a threshold Cerenkov detector and features a higher net sensitivity. A chamber filled with Co_2 gas acts as a Cerenkov medium for electrons scattered by the 16.7-MeV photons. The gas pressure is adjusted so that electrons scattered by photons having energies less than 16.7 MeV do not have sufficient energy to generate Cerenkov light in the gas.

32967 Alpha particle diagnostic based on damping of lower hybrid waves. Wong, K. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **56**: No. 5, 1073-1074(May 1985).

The feasibility of using lower-hybrid wave damping measurement as a diagnostic for energetic (above 200 keV) alpha particles has been investigated for large tokamaks like TFTR and FED devices. Detailed ray tracing calculations show that slow lower-hybrid waves can be used for TFTR, but the fast lower-hybrid wave is necessary for wave penetration into the dense plasma core of FED. It is possible to launch waves mainly damped on the energetic alpha particles whose velocity distribution function f/sub proportional/(r,v,t) is related to the wave damping rate. A 1% energetic alpha-particle concentration would cause substantial wave damping measurable by FIR laser scattering systems. Preliminary estimates show that this technique should yield good temporal resolution ($\sim$1 ms) and some spatial resolution for the alpha-particle distribution function. However, extensive computation is necessary to unfold the velocity dependence if it is at all possible.

32968 **New method for measuring ion temperatures in hot D—T plasma.** Smither, R.K.; Greenwood, L.R.; Hendel, H. (Argonne National Laboratory, Argonne, Illinois 60439). *Review of Scientific Instruments;* **56**: No. 5, 1078-1080(May 1985).

A new method has been found to measure the ion temperature of a hot D—T plasma. The new method makes use of two new neutron dosimetry reactions, ^{54}Fe(n,2n)^{53}Fe and ^{27}Al(n,2n)^{26}Al. What makes these reactions special is that their threshold energies are quite close to the centroid of the energy distribution of the neutrons emitted from a D—T plasma. This makes their reaction yields sensitive to only the upper half of the neutron energy distribution and therefore sensitive to both changes in the centroid and the width of the neutron energy distribution. The sensitivity to the width of the neutron energy distribution allows one to measure the ion temperature. If the plasma is in thermal equilibrium the ion temperature can be calculated from the ratio of the yields of the ^{54}Fe(n,2n)^{53}Fe reaction to the ^{27}Al(n, p)^{27}Mg reaction or a similar nonsensitive reaction. No absolute measurements are needed. Using both of the new dosimetry reactions the asymmetry of the neutron energy distribution for nonequilibrium conditions (neutral beams) can be measured. The ^{54}Fe(n,2n)^{53}Fe reaction is sensitive enough to monitor a single shot in TFTR.

32969 **Collimated ZnS (Ag)-detector array for Tokamak Fusion Test Reactor neutron source strength radial profile measurements.** Hendel, H.W.; Ku, L.P.; Long, D.C.; Nieschmidt, E.B.; Strachan, J.D. (Princeton University, Plasma Physics Laboratory, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **56**: No. 5, 1081-1083(May 1985).

Time-resolved radial profile measurements of neutron source strength and T/sub i/ are required to determine ion energy balance especially during sawtooth oscillations and adiabatic compression. We describe the Tokamak Fusion Test Reactor (TFTR) vertical multichannel (10) collimator, two channels of which are now being completed. ZnS detectors will be used (Bicron 720) to reject γ rays and scattered neutrons, and operated in both count rate and current modes. The frequency response is limited by counting statistics and sampling times, but resolves compression times $\approx$15—30 ms and T/sub i/ collapse times during sawtooth $\approx$2—3 ms. The collimator consists of the 6-ft test cell floor plus ~2-ft detector shield. Detector cross talk is calculated to be negligible. The dynamic range of the detectors is $>$ or $\approx 10^6$, covering the range from ohmically heated deuterium (2.5 MeV neutron emissions of $>$ or $\approx 10^{13}$ s^{-1}) to deuterium-beam heated tritium plasmas (14 MeV, $<$ or $\approx 10^{19}$ s^{-1}).

32970 **Effects of neutron energy spectrum on the efficiency calibration of epithermal neutron detectors.** Nieschmidt, E.B.; England, A.C.; Hendel, H.W.; Hillis, D.L.; Isaacson, J.A.; Ku, L.P.; Tsang, F.Y. (Princeton University, Plasma Physics Laboratory, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **56**: No. 5, 1084-1086(May 1985).

The ^{235}U epithermal neutron fission detector system at TFTR has been calibrated in situ, using three different neutron sources: ^{252}Cf, a D-D, and a D-T neutron generator. These sources produced a continuous spectrum, a line spectrum at ~2.5 MeV, and a line spectrum at ~14 MeV, respectively. The toroidally averaged detection efficiencies are 4.61 x 10^{-9} (^{252}Cf), 4.80 x 10^{-9} (D-D), and 5.42 x 10^{-9} (D-T) counts/neutron for a moderated 1.3-g ^{235}U detector placed ~4 m from the torus centerline. The effects of (n,2n) and (n,n′γ) reactions are discussed.

32971 **^{3}He gas scintillation spectrometer for fusion neutron measurements.** Derzon, M.S.; Slaughter, D.R.; Prussin, S.G. (Nuclear Engineering Department, University of California, Berkeley, California 94720). *Review of Scientific Instruments;* 56: No. 5, 1090-1092(May 1985).

A high-efficiency, good resolution neutron spectrometer can obtain time-resolved fusion rates and mean ion energies from yield and Doppler width measurements of the 2.5 -MeV neutron peak. Gas scintillation spectrometers are capable of operating at high data rates. In order to obtain adequate energy resolution large light yields and uniform light collection over the active detector volume are required. We have measured the absolute light yield from He—Xe gas mixtures. With a high light collection efficiency the detected photon yield from the ^{3}He(n, p)t reaction due to D—D neutrons will give adequate statistics for resolutions of a few percent. Calculations have been performed to model the detector optics in an effort to optimize the light yield and the uniformity of response. Measurements of detector resolution and time response have been made.

32972 **Approaches to ultrafast neutron detectors.** Wang, C.L.; Kalibjian, R.; Singh, M.S.; Wiedwald, J.D.; Campbell, D.E.; Campbell, E.M.; Cable, M.D.; Graves, W.R.; Lane, S.M.; Lerche, R.A.; Price, R.H.; Stearns, D.G.; Mourou, G.A.; Prussin, S.G. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Review of Scientific Instruments;* **56**: No. 5, 1096-1097(May 1985).

We discuss two approaches to obtain neutron detectors of very high temporal resolution. In the first approach, a uranium-coated cathode is used in a streak tube configuration. Secondary electrons accompanying the fission fragments from a neutron-uranium reaction are accelerated, focused through a pinhole, and streaked. Calculations show that 20-ps time resolution can be obtained. In the second approach, a uranium-coated cathode is integrated into a transmission line. State-of-the-art technology indicates that a time resolution of 20 ps can be obtained by gating the cathode with a fast electric pulse.

32973 **Nuclear techniques for determining the spatial and energy distribution of fast-confined alpha particles in ignited D—T plasma.** Slaughter, D.R. (University of California, Lawrence Livermore National Laboratory, Livermore, California 94550). *Review of Scientific Instruments;* **56**: No. 5, 1100-1102(May 1985).

There are several nuclear reactions between fast-confined α particles and low-z ions in ignited D—T plasma. Some of them produce unique and highly penetrating neutron or γ radiation. A study has begun to evaluate the feasibility of using these reactions to determine the spatial profile of fast-confined reaction product α particles, and to determine a crude envelope of their speed distribution as they thermalize. Particular attention is paid to the means of detecting these radiations, measuring their spectra, and most important of all, reducing and discriminating against the very much larger background of interfering radiation.

32974 **Neutral beam species measurements using in situ Rutherford backscatter spectrometry.** Kugel, H.W.; Kaita, R.; Gammel, G.; Williams, M.D. (Plasma Physics Laboratory, Princeton University, P. O. Box 451, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **56**: No. 5, 1105-1107(May 1985).

This work describes a new in situ method for measuring the neutral particle fractions in high-power deuterium neutral beams, used to heat magnetically confined fusion plasmas. Deuterium beams, of variable energies, pulse lengths, and powers up to 47 keV, 100 ms, 1.6 MW, were Rutherford backscattered at 135° from the TiC inner neutral beam armor of the PDX, and detected using an electrostatic analyzer with a microchannel plate. Complete energy scans were made every 20 ms and data were obtained simultaneously from five different positions across the beam profile. The neutral particle fractions were measured to be $D^0(E):D^0(E/2):D^0(E/3) = 53:32:15$. The corresponding neutral power fractions were $P^0(E):P^0(E/2):P^0(E/3) = 72:21:7$, and the associated ionic fractions at the output of the ion source were $D^+{}_1\,(E):D^+{}_2\,(E):D^+{}_3\,(E) = 74:20:6$. The measured neutral particle fractions were relatively constant over more than 70% of the beam power distribution. A decrease in the yield of the full-energy component in the outer regions of the beam was observed.

32975 **Improved performance for large area triple layer microchannel-plate detector for a neutral particle spectrometer in Doublet III.** Armentrout, C.J. (GA Technologies Inc., P. O. Box 85608, San Diego, California 92138). *Review of Scientific Instruments;* **56**: No. 5, 1108-1110(May 1985).

A 2 x 30-cm three-layer, microchannel-plate (MCP) assembly has been constructed with 120 anodes to collect electrons. It has a gain of up to 5 x 10^8 in the pulse counting mode. The device displays an unexpectedly high per-anode count rate. The original device had major problems: 5 x gain variation along its length and 150% FWHM/gain ratio. It is shown through a model distribution function that both effects can be due to the space charge limiting of pulses that cross the interstage gaps. One detector was rebuilt with greatly reduced interstage gaps and now displays 60% FWHM/gain and a 30% gain variation. This has significantly improved the pulse counting capability of the spectrometer.

32976 EparallelB end-loss-ion analyzer for Tandem-Mirror Experiment-Upgrade. Foote, J.H.; Coutts, G.W.; Pedrotti, L.R.; Schlander, L.; Wood, B.E. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Review of Scientific Instruments;* **56**: No. 5, 1117-1119(May 1985).

We are constructing and testing a diagnostic instrument to investigate, in detail, ions emanating along magnetic field lines from the plasma region of the TMX-U tandem-mirror experiment. This analyzer (of Tokamak Fusion Test Reactor design) contains parallel electric and magnetic fields, which yield ion mass and energy spatial separation, respectively. A two-dimensional array of 128 copper collector plates detects the particles. The entering ion flux is first well collimated and then focused onto the detector plane during the 180° bending in the magnetic field. This instrument is designed to measure higher particle energies than the present gridded end-loss analyzers as well as determine the energy spectra more accurately. Tandem-mirror plasma parameters to be investigated with this analyzer include end-plug potential, average central-cell-ion energy, and plasma potential in the thermal barrier and nearby regions. We plan a time resolution of up to 2 kHz for each detector.

32977 Lanthanum hexaboride tapered filament in a plasma source. Pincosy, P.A.; Leung, K.N. (Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Review of Scientific Instruments;* **56**: No. 5, 655-658(May 1985). Contract AC03-76SF00098.

A directly heated lanthanum hexaboride tapered filament has been tested in a plasma generator. A uniform temperature distribution at 1820 K has been achieved. The heating and cooling power calculated from measured quantities are balanced. A maximum arc current of 80 A was obtained, limited only by the power supply and plasma generator. The corresponding hydrogen ion current density was 0.6 A/cm^2 when the arc voltage was 80 V and the filament heater current was about 5 A. The filament was capable of emitting 100 A of current at an operating temperature of 1900 K. The estimated lifetime for this filament is 900 h.

32978 Statistical theory of cubic langmuir turbulence. Sun, G.; Nicholson, D.R.; Rose, H.A. (Department of Physics and Astronomy, The University of Iowa, Iowa City, Iowa 52240). *Physical Review Letters;* **54**: No. 15, 1664-1667(15 Apr 1985). Contract AC02-82ER53136.

The cubic direct-interaction approximation is applied to the truncated cubically nonlinear Schroedinger equation. The statistical theory does a satisfactory job in several important respects.

32979 Spectrum of resistive MHD modes in cylindrical plasmas. Ryu, C.M.; Grimm, R.C. (Princeton Univ., NJ (USA). Plasma Physics Lab.). *Journal of Plasma Physics;* 32: 207-237(Oct 1984).

A numerical study of the normal modes of a compressible resistive MHD fluid in cylindrical geometry is presented. Resistivity resolves the shear Alfven and slow magnetosonic continua of ideal MHD into discrete spectra and gives rise to heavily damped modes whose frequencies lie on specific lines in the complex plane. Fast magnetosonic waves are less affected but are also damped. Overstable modes arise from the shear Alfven spectrum. The stabilizing effect of favourable average curvature is shown. Eigenfunctions illustrating the nature of typical normal modes are displayed.

7002 Fusion Power Plant Technology

32980 (AD-A—150519/7/XAB) Increased hot-electron production at quarter-critical density in long-scalelength, laser-plasma interactions. Memorandum report, September-October 1984. Young, F.C.; Herbst, M.J.; Manka, C.K.; Obenschain, S.P.; Gardner, J.H. (Naval Research Lab., Washington, DC (USA)). 11 Feb 1985. 14p. (NRL-MR—5484). NTIS, PC A02/MF A01.

Hot-electron fractions measured in Nd-laser-plasma interactions at 1014W/cm2 increase from <0.02% to 0.3% as the plasma scalelength at quarter-critical density (nc/4)is systematically increased from 140 microns to 320 microns. Correlated x-ray and 3w/2 emissions indicate that the hot electrons are produced by a nc/4 instability.

32981 (AERE-R—11321) Report on a visit to Canada to discuss tritium instrumentation and radiological protection. Gibson, J.A.B. (UKAEA Atomic Energy Research Establishment, Harwell. Environmental and Medical Sciences Div.). Oct 1984. 27p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701235.

A report is presented of a visit to Canada on behalf of the CEC DG II/Fusion between the 8th to 13th April 1984. Discussions were arranged by the Canadian Fusion-Fuels Technology Project near Toronto and covered all aspects of tritium technology but especially radiological protection. Visits included the CFFTP Centre, Pickering Nuclear Generating Section, Ontario Hydro's Head Office, Safety Services Department and Research Division, Scintrex Ltd (tritium instrument manufacturers) and the Atomic Energy of Canada (AECL) Chalk River Nuclear laboratories (CRNL). There are clearly many areas for the use of Canadian Technology in Europe, particularly with CRNL and Scintrex on the development of $^3H_2/^3H_2O$ discriminating monitors. There is some doubt whether these development will be in time for applications at the JET laboratory and the JRC at ISPRA but this collaboration will be pursued.

32982 (CONF-831203—193) Maintenance and availability considerations for MFTF-B upgrade. Spampinato, P.T. (Oak Ridge National Lab., TN (USA)). 1983. Contract AC05-84OR21400. 6p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012344.

From 10. symposium on fusion engineering; Philadelphia, PA, USA (5 Dec 1983).

The upgrade of the Mirror Fusion Test Facility (MFTF-B) tandem mirror device incorporates the operation of advanced systems plus the requirement for remote maintenance. To determine if the operating availability goal of this device is achievable, an assessment of component lifetimes was made, along with estimates of device downtime. Key subsystem components were considered from the magnet, heating, impurity control, pumping, and test module systems. Component replacements were grouped into three categories, and a lifetime operating plan, including component replacements, was developed. It was determined that this device could achieve a 10% operating availability.

32983 (CONF-840311—18) Status of gyrotron developments at Varian Associates. Jory, H. (Varian Associates, Inc., Palo Alto, CA (USA)). 1984. Contract AC05-84OR21400. 7p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011576.

From 4. international symposium on heating in toroidal plasmas; Rome, Italy (21 Mar 1984).

The status of gyrotrons developed by Varian for fusion heating applications will be briefly reviewed. Development work started in 1976 with the goal of 200 kW CW at 28 GHz. A more recent program was to develop 200 kW CW at 60 GHz. Pulsed and CW tubes produced by these programs will be briefly described and the scaling of these designs to other frequencies including 53, 56 and 70 GHz will be discussed. A 35 GHz design will also be described. Future efforts for gyrotrons at 120 and 140 GHz will also be discussed.

32984 **(CONF-850301—7) Stellarator approach to fusion plasma confinement.** Harris, J.H. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 13p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011420.

From 12. annual energy technology conference and exposition; Washington, DC, USA (25 Mar 1985).

The stellarator is a toroidal fusion plasma confinement device with nested magnetic flux surfaces. The required twist of the field lines is produced by external helical coils rather than by plasma current, as in a tokamak. Stellarator devices are attractive fusion reactor candidates precisely because they offer the prospect of steady-state operation without plasma current. In the last few years the excellent results achieved with currentless stellarator plasmas of modest minor radius (10 to 20 cm) at Kyoto University (Japan) and the Max Planck Institute (West Germany) have made the stellarator second only to the tokamak in its progress toward fusion breakeven, with temperatures T/sub e/, T/sub i/ ~ 1 KeV, Lawson products n tau ~ 2 to 5 x 10^{12} cm^{-3}.s, and volume-averaged beta values $\approx$ 2%. The Advanced Toroidal Facility (ATF), now under construction at Oak Ridge Natioal Laboratory (ORNL) and scheduled to operate in 1986, represents a significant advance in stellarator research, with a plasma major radius of 2.1 m, an average minor radius of 0.3 m, and a magnetic field of 2 T for 5 s or 1 T at steady state. ATF replaces the Impurity Study Experiment (ISX-B) tokamak at ORNL and will use the ISX-B heating and diagnostic system.

32985 **(CONF-850310—96) Economic analysis of fusion breeders.** Delene, J.G. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011560.

From 6. topical meeting on the technology of fusion energy; San Francisco, CA, USA (3 Mar 1985).

This paper presents a study of the economic performance of Fission/Fusion Hybrid devices. This work takes fusion breeder cost estimates and applies methodology and cost factors used in the fission reactor programs to compare fusion breeders with Liquid Metal Fast Breeder Reactors (LMFBR). The results of the analysis indicate that the Hybrid will be in the same competitive range as proposed LMFBRs and have the potential to provide economically competitive power in a future of rising uranium prices. The sensitivity of the results to variations in key parameters is included.

32986 **(CONF-850310—97) Assessment of magnetic field asymmetries in ELMO Bumpy Square.** Uckan, T.; Uckan, N.A. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011559.

From 6. topical meeting on the technology of fusion energy; San Francisco, CA, USA (3 Mar 1985).

There exist two separate and independent magnetic field asymmetries in the ELMO Bumpy Square (EBS). One is associated with the small perturbations in the magnetic field, known as the field errors, caused by coil misalignments during installation, imperfection in coil winding, etc. The second source of asymmetry is the magnetic field ripple in the high-field toroidal solenoids (corners) produced by the finiteness of the number of coils. In general, these two sources of asymmetry introduce enhanced transport losses (in addition to other effects, to the system, although they affect different classes of particles. Toroidally passing (circulating) particles (v/sub parallel//v ~ 1) are influenced by the field errors, whereas trapped particles (v/sub parallel//v ~ 0) in the corners are influenced by the field ripple. In this paper we discuss these two effects separately and calculate the allowable magnitudes of the field error and field ripple in EBS, both for an experimental-size device and for a reactor.

32987 **(CONF-850310—99) Advanced Toroidal Facility (ATF).** Thompson, P.B. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 6p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011567.

From 6. topical meeting on the technology of fusion energy; San Francisco, CA, USA (3 Mar 1985).

The Advanced Toroidal Facility (ATF) is a new magnetic plasma confinement device, under construction at Oak Ridge National Laboratory (ORNL), which will lead to improvements in toroidal magnetic fusion reactors. ATF is a type of stellarator known as a torsatron which theoretically has the capability at ≧8% beta in steady state. The ATF plasma has a major radius of 2.1 m, an average minor radius of 0.3 m, and a field of 2 T for a 5-s duration or 1 T steady state. The ATF device consists of a helical field (HF) coil set, a set of poloidal field (PF) coils, an exterior shell structure to support the coils, and a thin helically contoured vacuum vessel inside the coils. The ATF replaces the ISX-B tokamak at ORNL and will use the ISX-B auxiliary systems including 4 MW of neutral injection heating and 0.2 MW of electron cyclotron heating. ATF device is scheduled to start operation in the fall of 1986. An overview of the ATF device is presented including details of the construction process envisioned.

32988 **(CONF-850310—102) Technical benefit of an international project.** Flanagan, C.A. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012781.

From 6. topical meeting on the technology of fusion energy; San Francisco, CA, USA (3 Mar 1985).

One critical issue examined in the present phase of the International Tokamak Reactor (INTOR) has been an evaluation of the technical benefit of dividing up the design and component production tasks of all major advanced technologies among all participants. Two approaches were evaluated: (1) a "splitting" approach in which each country provides 1/4 of the components of each major system (e.g., 3 of 12 TF coils), (2) a "branching" approach in which each country provides all components of selected major systems (e.g., first country provides all TF coils, second country provides all torus sectors, etc.). Quantitative cost and schedule estimates were developed for each of the two approaches and compared to the cost and schedule of the entire device if it were produced only by one country. The results of the US evaluation indicated that the ratio of total estimated cost to the "national" cost was 1.66 for "splitting" and 1.20 for "branching". The cost per participant was 0.41 and 0.30, respectively. The increase in the construction schedule was estimated to be 2.6 years.

32989 **(CONF-850310—105) Fusion facility siting considerations.** Bussell, G.T. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 6p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012894.

From 6. topical meeting on the technology of fusion energy; San Francisco, CA, USA (3 Mar 1985).

Inherent in the fusion program's transition from hydrogen devices to commercial power machines is a general increase in the size and scope of succeeding projects. This growth will lead to increased emphasis on safety, environmental impact, and the external effects of fusion in general, and of each new device in particular. A critically important consideration in this regard is site selection. The purpose of this paper is to examine major siting issues that may affect the economics, safety, and environmental impact of fusion.

32990 **(DOE/DP/40200—T1) Thermal transport measurements of uv laser irradiated spherical targets.** Jaanimagi, P.A.; Delettrez, J.; Henke, B.L.; Richardson, M.C. (Rochester Univ., NY (USA). Lab. for Laser Energetics). [1985]. Contract FC08-85DP40200;AS08-82DP40175. 36p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85011038.

New measurements are presented of thermal transport in spherical geometry using time-resolved x-ray spectroscopy. We determine the time dependence of the mass ablation rate m(dot) by following the progress of the ablation surface through thin layers of material embedded at various depths below the surface of the target. These measurements made with 6 and 12 uv (351 nm) beams from OMEGA are compared to previous thermal transport data and are in qualitative agreement with detailed LILAC hydrodynamic code simulations which predict a sharp decrease in m(dot) after the peak of the laser pulse. Non-uniform laser irradiation of the target results in the anomalously high values of m(dot) measured in these experiments.

32991 (DOE/ER/40112—T1) Theoretical and computational research on the focused transport of intense charged particle beams. Annual report, August 1983-September 1984. Haber, I. (Naval Research Lab., Washington, DC (USA)). 1984. Contract AI05-83ER40112. 16p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012980.

Computer calculations were used to investigate the behavior of a periodic solenoidal thin-lens focusing system with 90° phase advance. Despite strong similarities in the behavior predicted by the linear theory, a 90° solenoidal system does not appear to exhibit the emittance growth characteristic of the similar 90° alternate gradient system. In other ways, however, behavior is observed which is similar to the analagous alternate gradient system. (MOW)

32992 (DOE/ER/53179—T3) Preparation and use of very pure o-D_2. Technical report No. 1. Honig, A.; Lewis, M.; Yu, Z.Z.; Yucel, S. (Syracuse Univ., NY (USA)). 26 Mar 1985. Contract FG02-84ER53179. 34p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85009415.

Optimum production and utilization of spin-polarized deuterium as a fusion fuel requires long nuclear spin-lattice relaxation times at temperatures near 4K. This can be achieved with very high purity ortho-D_2. We report new experimental methods and results of total-adsorption catalysis of D_2 para-ortho conversion in the 4 to 15K temperature region, using as catalysts activated alumina and partially-activated charcoal. Because of the strongly anisotropic adsorbate binding on alumina, the ortho-D_2 equilibrium concentration near 10 to 12K (where the conversion time is acceptable) is not high enough, and near 4K (where the equilibium ortho-D_2 concentration is satisfactory) the conversion time is almost prohibitively too long to permit achievement of the desired ortho-D_2 purity. Although doping alumina with paramagnetic ions could improve this situation, it would be at the expense of excessive back-conversion upon desorption.

32993 (DOE/OR/21400—T125) Confinement experiments on ISX-B. Wootton, A.J. (Oak Ridge National Lab., TN (USA)). [1985]. Contract AC05-84OR21400. 35p. NTIS MF A01; 2; GPO Dep. File Number DE85012346.

The following topics are discussed: (1) direction of the experimental program, (2) status as of November 1982, (3) how to improve confinement, and implications for scaling of electron thermal diffusivity, (4) balanced beam injection, and (5) electric fields. (MOW)

32994 (DP-MS—84-129) Tritium-helium effects in metals. Caskey, G.R. Jr. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1985. Contract AC09-76SR00001. 20p. (CONF-850405—8). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011507.

From 2. national topical meeting on tritium technology in fission, fusion and isotopic applications; Dayton, OH, USA (30 Apr 1985).

Investigations of helium effects in metals at the Savannah River Laboratory have been carried out by introducing helium by radioactive decay of tritium. This process does not create concurrent radiation damage, such as accompanies ion implantation and (n,α) reactions. The process has its own peculiarities, however, which partially mask and interact with the helium effect of interest. The distribution and local concentration of helium and tritium, which are responsible for changes in mechanical properties and fracture mode, are controlled by the large difference in solubility and diffusivity between the two atoms and by their differing interaction energies with lattice defects, impurities, and internal boundaries. Furthermore, in all investigations with helium generated from tritium decay, some tritium and deuterium are always present. Consequently, property changes include tritium-helium interaction effects to some extent. Results of investigations with several austenitic stainless steels, Armco iron, and niobium single crystals illustrate the variety of phenomena and some of the complex interactions that can be encountered.

32995 (EGG—2393) Survey of element and isotope importance for fusion safety and environmental assessments. Piet, S.J. (EG and G Idaho, Inc., Idaho Falls (USA)). May 1985. Contract AC07-76ID01570. 34p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012415.

A survey was made, using the most reliable information possible, to identify which elements and isotopes are potentially important for fusion safety and environmental assessments. It was determined that 51 elements may be exposed to fusion neutrons in either experimental devices or commercial reactors. These elements were prioritized by the relative probability of use. Also, 371 radioactive isotopes were identified that may be produced from these elements. These isotopes were prioritized by screening criteria that measured their relative importance to effluent assessments, accident assessments, and waste management assessments. Survey results presented in this report are prioritized lists of elements and isotopes of importance to neutronics researchers, effluent assessors, accident assessors, waste management assessors, maintenance assessors, and volatility and/or transport researchers. It is hoped that the results of this effort will lead to improved information in the various area, which in turn will lead to better safety and environmental assessments.

32996 (HEDL-TME—84-29) Experimental lithium system. Final report. Kolowith, R.; Berg, J.D.; Miller, W.C. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1985. Contract AC06-76FF02170. 326p. NTIS, PC A15/MF A01; GPO Dep. File Number DE85013252.

A full-scale mockup of the Fusion Materials Irradiation Test (FMIT) Facility lithium system was built at the Hanford Engineering Development Laboratory (HEDL). This isothermal mockup, called the Experimental Lithium System (ELS), was prototypic of FMIT, excluding the accelerator and dump heat exchanger. This 3.8 m^3 lithium test loop achieved over 16,000 hours of safe and reliable operation. An extensive test program demonstrated satisfactory performance of the system components, including the HEDL-supplied electromagnetic lithium pump, the lithium jet target, the purification and characterization hardware, as well as the auxiliary argon and vacuum systems. Experience with the test loop provided important information on system operation, performance, and reliability. This report presents a complete overview of the entire Experimental Lithium System test program and also includes a summary of such areas as instrumentation, coolant chemistry, vapor/aerosol transport, and corrosion.

33001 (INIS-mf—9429) Hybrid fusion-fission reactors. Thomas, J.B. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service d'Etudes des Reacteurs et de Mathematiques Appliquees). 1983. 24p. (In French). (CONF-8306262—1). NTIS (US Sales Only), PC A02/MF A01. File Number DE85780918.

From Belgian Nuclear Society annual meeting on advanced uses of accelerators on the nuclear fuel cycle; Brussels, Belgium (13 Jun 1983).

After a review of the different possibilities of the concept of hybrid reactor, the article considers as an example a reactor whose source is a small size Tokamak with a D.T. fusion cycle. The principles of such a reactor, its potential, the main parameters having an effect on its performance and its feasibility as well as the economic parameters are discussed. (AF).

33002 (IPF—83-8) Multihole couplers for overmoded waveguide systems. Janzen, G.; Stickel, H. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Plasmaforschung). Dec 1983. 29p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85780964.

Directional couplers for transverse electric (TE) modes are described which selectively pick one mode from a mode mixture in an overmoded circular waveguide system. Unwanted modes are statistically nulled out in the coupling waveguide. Mode selectivity and directivity oscillate up and down with an increasing number of holes and finally reach approximately the 20 dB mark. A directional coupler for the TE_{02} mode (28 GHz, 63.4 mm circular waveguide) with 41 holes and a length of 1.6 m shows a directivity of 68 dB and suppresses TE_{01} with 58 dB, TE_{03} with 28 dB, TE_{04} with 34 dB, TE_{22} with 37 dB, and further modes TEsub(lm)(l<5, m<6) with 17 dB to 34 dB.

33003 (IPF—83-9) Short mode selective directional couplers. Janzen, G.; Stickel, H. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Plasmaforschung). Dec 1983. 22p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85780963.

Short mode selective directional couplers for transverse electric (TE) modes travelling in overmoded circular waveguides are described. Directivity is achieved by pairs of holes with destructive interference in backward direction, unwanted modes are suppressed by destructive interference in either directions of the coupling guide. A 28 GHz narrow directional coupler for the TE_{01} mode (63.4 mm waveguide diameter) with 16 holes and a length of 230 mm shows a directivity of 55 to 100 dB between 27.9 and 28.1 GHz, suppressing the TE_{02} mode with 35 to 80 dB, the TE_{03} mode with 30 to 65 dB, and the TE_{22} mode with 30 to 70 dB.

33004 (IPF—84-5) Electron cyclotron resonance heating system for the stellarator W VII-AS. Wilhelm, R.; Erckmann, V.; Janzen, G.; Kasparek, W.; Mueller, G.; Schueller, P.G.; Schwoerer, K.; Thumm, M. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Plasmaforschung). Jul 1984. 29p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85780961.

Review and discussion of the physical and technical aspects of the W VII-AS ECRH system are presented.

33005 (IPF—84-6) High-power millimeter-wave mode converters in overmoded circular waveguides using periodic wall perturbations. Thumm, M. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Plasmaforschung). Jul 1984. 40p. (CONF-8407120—1). NTIS (US Sales Only), PC A03/MF A01. File Number DE85780960.

From International symposium on gyrotron development; Lausanne, Switzerland (4 Jul 1984).

This work reports on measurements and calculations (coupled mode equations) on the conversion of circular elecric TEsub(0n) gyrotron mode compositions (TE_{01} to TE_{04}) at 28 and 70 GHz to the linearly polarized TE_{11} mode by means of a mode converter system using periodic waveguide wall perturbations. Mode transducers with axisymmetric radius perturbations transform the TEsub(0n) gyrotron mode mixture to the more convenient TE_{01} mode for long-distance transmission through overmoded waveguides. Proper matching of the phase differences between the TEsub(0n) modes and of lengths and perturbation amplitudes of the several converter sections is required. A mode converter with constant diameter and periodically perturbed curvature transfers the unpolarized TE_{01} mode into the TE_{11} mode which produces an almost linearly polarized millimeter-wave beam needed for efficient electron cyclotron heating (ECRH) of plasmas in thermonuclear fusion devices. The experimentally determined TEsub(0n)-to-TE_{01} conversion efficiency is (98+-1)% at 28 and 70 GHz (99% predicted) while the TE_{01}-to-TE_{11} converter has a (96+-2)% conversion efficiency at 28 GHz (95% predicted) and (94+-2)% at 70 GHz (93% predicted); ohmic losses are included.

33006 (IPF—84-9) Wave absorption and transport studies on ECR heated stellarator plasmas in W VII-A. Erckmann. V.; Janzen, G.; Kasparek, W.; Mueller, G.; Raeuchle, E.; Schueller, P.G.; Schwoerer, K.; Thumm, M.; Wilhelm, R.; Dorst, D. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Plasmaforschung). Sep 1984. 15p. (CONF-840910—27; IAEA-CN—44/D-I-5). NTIS (US Sales Only), PC A02/MF A01. File Number DE85780959.

From 10. international conference on plasma physics and controlled nuclear fusion research; London, UK (12 Sep 1984).

OH-current free stellarator plasmas with attractive parameters could be produced by irradiating intense, linearly polarized ECR waves into W VII-A. These waves were launched in O-mode orientation from the torus outside in the TE_{11} or HE_{11} mode. The localized power deposition results in a very narrow electron temperature profile, but it also allows profile shaping by choosing off-axis EC resonance. The total absorption agrees well with single-pass O-mode absorption, even at extreme power densities and at conditions of fully relativistic absorption. In contrast to theoretical expectations, the reflection of the non-absorbed O-mode power in X-mode orientation did not improve the overall heating efficiency, however. Optimum confinement of the stellarator plasma in W VII-A is achieved at irrational t-values. At these optimum conditions the electron energy transport in the ECRH-sustained plasma can be described by three main contributions: axisymmetric neoclassical transport in the central region, neoclassical losses due to the helical ripple at LMFP conditions in the intermediate zone, and anomalous losses dominating in the edge region.

33007 (IPP—1/234) Investigation of tritium removal by means of organic compounds. Catalytic hydrogenation (tritiation) of linoleic acid. El-Sharnouby, A.; Weichselgartner, H. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). Nov 1984. 20p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85751653.

In the presence of noble-metal catalysts unsaturated fatty acids such as eruic acid and linoleic acid capture hydrogen (and tritium) quantitatively. The hydrogenation reaction of eruic acid has already been reported. The experimental results of the reaction of hydrogen (and tritium) with linoleic acid are now discussed in this paper. Obviously, the use of linoleic acid shows some advantages compared with eruic acid: - the hydrogenation reaction is faster, - linoleic acid is liquid, so that the choice of additional solvents is easier, and - linoleic acid is a more or less cheap natural product, which is available from a series of seeds, so that the cost of a technical tritium removal plant is not increased by the basic chemical material.

33008 (IPP—4/218) Description of the low-power part of the RF-System for the Lower-Hybrid experiments in ASDEX. Zouhar, M. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). Feb 1984. 24p. (In German). NTIS (US Sales Only), PC A02/MF A01. File Number DE85780965.

A description of the 1.3 GHz RF-System for the Lower-Hybrid experiments in ASDEX is given including the RF-part of the data acquisition system. Special emphasis is devoted to the amplitude- and phase-regulating system.

33009 (IPP—III/97) Time and space-resolved energy flux measurements in the divertor of the ASDEX tokamak by computerized infrared tomography. Mueller, E.R.; Steinmetz, K.; Bein, B.K. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). Jun 1984. 52p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85780955.

A new, fully computerized and automatic thermographic system has been developed. Its two central components are an AGA THV 780 infrared camera and a PDP-11/34 computer. A combined analytical-numerical method of solving the 1-dimensional heat diffusion equation for a solid of finite thickness bounded by two parallel planes was developed. In high-density (anti nsub(e) = 8 x 10^{13} cm^{-3}) neutral-beam-heated (L-mode) divertor discharges in ASDEX, the power deposition on the neutralizer plates is reduced to about 10-15% of the total heating power, owing to the inelastic scattering of the divertor plasma from a neutral gas target. Between 30% and 40% of the power is missing in the global balance. The power flow inside the divertor chambers is restricted to an approximately 1-cm-thick plasma scrape-off layer. This width depends only weakly on the density and heating power. During H-phases free of Edge Localized Mode (ELM) activity the energy flow into the divertor is blocked. During H-phases with ELM activity the energy is expelled into the divertor in very short intense pulses (several MW for about one hundred μs). Sawtooth events are able to transport significant amounts of energy from the plasma core to the peripheral zones and the scrape-off layer, and they are frequently correlated with transitions from the L to the H mode.

33010 **(JAERI-M—83-230) Electrical resistivity change in Cu and Al stabilizers of superconducting magnets after low-temperature neutron irradiation.** Nakata, Kiyotomo; Tada, Naobumi; Masaoka, Isao; Takamura, Saburo. (Japan Atomic Energy Research Inst., Tokyo). Jan 1984. 35p. (In Japanese). NTIS (US Sales Only), PC A03/MF A01. File Number DE85700997.

Copper(Cu) and aluminum(Al) are candidate materials for a stabilizer of a superconducting magnet in a fusion reactor. These materials are irradiated by fast neutrons at about 5K and annealed to 300K, and the repeated irradiations are performed. The change in the magnetoresistivity at 4.2K after the irradiation and after the annealing is measured and the effect of cold work and purity of materials is studied. The following results are obtained: 1) The resistivity increase by irradiation in Al is about three times larger than that in Cu. 2) After 300K anneal, about 20% of the radiation induced resistivity in Cu remains and the radiation induced resistivity in Al annihilates. 3) The radiation induced resistivity in cold worked Cu with R.R.R. of 300 is equal to that in annealed one. The amount of radiation induced resistivity remained after 300K anneal (Δ rho sub(ann)) in cold worked Cu is smaller than Δ rho sub(ann) in annealed Cu. 4) The radiation induced magnetoresistivity (Δ rho) of the high purity Cu with R.R.R. of 1400 is larger than that with R.R.R. of 300. Δ rho in the former increases with increasing the magnetic field, while Δ rho in the latter is constant despite the magnetic field. The pre-irradiation resistivity of cold worked Cu is very large as compared with that of annealed one. Therefore, the annealed Cu with R.R.R. of 300 is considered to be the best material as the stabilizer used under irradiation from consideration of above results.

33011 **(JAERI-M—84-011) Evaluation of thermal stress in the anode chamber wall of a Large Volume Magnetic Bucket Ion Source.** Wells, Russell; Horiike, Hiroshi; Kuriyama, Masaaki; Ohara, Yoshihiro. (Japan Atomic Energy Research Inst., Tokyo). Feb 1984. 39p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85700995.

Thermal stress analysis was performed on the plasma chamber of the Large Volume Magnetic Multipole Bucket Ion Source (LVB) designed for use on the JT-60 NBI system. The energy absorbed by the walls of the plasma chambers of neutral beam injectors is of the order of 1% of the accelerator electrical drain power. A previous study indicates that a moderately high heat flux, of about 600W/cm^2, is concentrated on the magnetic field cusp lines during normal full power operation. Abnormal arc discharges during conditioning of a stainless steel LVB produced localized melting of the stainless steel at several locations near the cusps lines. The power contained in abnormal arc discharges (arc spots) was estimated from the observed melting. Thermal stress analysis was performed numerically on representative sections of the copper LVB design for both stable and abnormal arc discharge conditions. Results show that this chamber should not fail due to thermal fatigue stesses arising from normal arc discharges. However, fatigue failure may occur after several hundred to a few thousand arc spots of 30mS duration at any one location. Limited arc discharge operation of the copper bucket was performed to partially verify the chamber's durability.

33012 **(JAERI-M—84-012) Fabrication and testing of a quartz oscillator microbalance.** Hiroki, Seiji; Abe, Tetsuya; Inagawa, Konosuke; Obara, Kenjiro; Murakami, Yoshio. (Japan Atomic Energy Research Inst., Tokyo). Feb 1984. 17p. (In Japanese). NTIS (US Sales Only), PC A02/MF A01. File Number DE85700993.

A quartz oscillator microbalance was developed for continuous measurement of gas adsorption on the first wall of fusion devices. Important factors affecting the frequency stability of the quartz oscillator are electromagnetic noise, temperature change, drive power and capacitance. We studied these problems and fabricated an optimum circuit for the microbalance. Relevant experimental results are also presented.

33013 **(JAERI-M—84-013) In-pile test of tritium release from lithium oxide. An evaluation study on neutronics and thermohydraurics of sweep gas capsule packed with Li_2 O pellets.** Kurasawa, Toshimasa; Yoshida, Hiroshi; Watanabe, Hitoshi. (Japan Atomic Energy Research Inst., Tokyo). Feb 1984. 54p. (In Japanese). NTIS (US Sales Only), PC A04/MF A01. File Number DE85700998.

Material development and blanket design of lithium-based ceramics such as Li_2O, $LiAlO_2$, Li_2SiO_3, Li_2ZrO_3 has been performed to study their applicability to the tritium breeding blanket of a fusion reactor. Especially, the need of the test with regard to tritium release characteristics, material integrity, and neutronics and thermohydraurics of these materials under the operating conditions of the blanket has been emphasized in Japan, US and Europe. Tritium release characteristics of Li_2O pellets under thermal neutron flux were measured by the present work which forms a part of "Irradiation Tests of Lithium Oxide under High Neutron Flux". Irradiation was carried out in a vertical hole of the JRR-2(VT-10 in the fuel rods region, phi sub(th) = 1.0 x 10^{14}, phi sub(f) = 1 x 10^{13} n/cm^2. sec), and total irradiation time was 990hrs. This report describes distributions of reaction rates of $^6Li(n,\alpha)^3H$ and $^7Li(n,n\alpha)^3H$ and temperature of the Li_2O pellets in the sweep gas capsule as well as the effect of induced radioactivity due to impurities in the lithium oxide.

33014 **(JAERI-M—84-034) Type tests of the welded bellows for the ports of the JT-60 vacuum vessel.** Takatsu, Hideyuki; Yamamoto, Masahiro; Shimizu, Masatsugu; Suzuki, Kazuo; Sonobe, Tadashi; Hayashi, Yuzo; Mizuno, Genichiro. (Japan Atomic Energy Research Inst., Tokyo). Mar 1984. 58p. (In Japanese). NTIS (US Sales Only), PC A04/MF A01. File Number DE85700999.

Type tests of three kinds of the welded bellows were carried out to examine their applicability to the ports of the JT-60 vacuum vessel, because strict specifications on the mechanical, vacuum and thermal properties were required for them. The following conclusions were obtained after seven kinds of type tests. (1) Spring constant and stress measurement tests showed a good agreement between the measured values and the calculated ones and confirmed the validity of the spring constant and stress evaluation formula. (2) The results of the Helium leak and outgassing rate measurement tests were found to be below the specifications and showed the good vacuum property of the welded bellows. (3) The welded bellows kept up the structural integrity after the thermal cycle, life and pressure tests and sufficient thermal and mechanical property of the welded bellows was confirmed.

33015 **(JAERI-M—84-062) Design of JT-60 first wall.** Nakamura, Hiroo; Shimizu, Masatsugu; Masuda, Michio; Shimizu, Toru; Ohta, Mitsuru; Miyauchi, Yasuyuki. (Japan Atomic Energy Research Inst., Tokyo). Mar 1984. 56p. (In Japanese). NTIS (US Sales Only), PC A04/MF A01. File Number DE85700994.

This paper describes an outline of JT-60 first wall design. Main purpose of JT-60 is to achieve reactor grade plasma and maintain 5 – 10 sec plasma discharge. Therefore, the requirements from physics and engineering aspects are extremely severe than the one in currently operating tokamak. In FY1974 – 1976, to make clear the points at issue and the technological prospects, a number of examinations and R and D works have been performed. As a result, molybdenum has been selected as a JT-60 first wall material.

Also, toroidal fixed limiter, magnetic limiter plate and liner have been applied as first wall structures. Since a time constant of plasma current decay during a disruption was changed from 50 msec to 1 msec (Target value), liner material was changed to Inconel 625. Mechanical design criterion is based on ASME Section III code. All first wall components are designed to withstand the mechanical load at 3 msec plasma disruption. Design values of heat flux and duration time are 305 w/cm^2 and 10 sec for the toroidal fixed limiter, and 440 w/cm^2 and 5 sec for the magnetic limiter plate, respectively. Interval time between discharges is 10 min. Design values of the maximum surface temperature are 900sup(o)C for molybdenum and 600sup(o)C for Inconel 625, respectively. First wall structure is designed to protect bellows, thermocouples and electromagnetic sensors against severe plasma thermal load. Also, the first wall can be exchanged easily for first wall experiment. Titanium carbide, 20 μm in thick, are coated onto the first wall. Details of the first wall design will be published in another reports.

33016 (JINR-D—2,-13-83-689, pp 101-116) **Lasers for controlled thermonuclear fusion.** Basov, N.G.; Danilychev, V.A. (AN SSR, Moscow. Fizicheskij Inst.). 1983. (In Russian). NTIS (US Sales Only), PC A08/MF A01. File Number DE85780874. (CONF-8306179—).

From Working meeting on problems of radiation and detection of gravitational waves; Dubna, USSR (7 Jun 1983).

Laser system designs for controlled thermonuclear reactor drivers are described. CO_2-lasers and lasers in excimer media are considered. Parameters 1 mJ of KrF laser for CTF and parameters of a high current electron accelerator for 800 kJ energy for pumping the terminal amplification module of the KrF laser are indicated. The laser KrF system comprises 10 KrF-amplifiers producing 150 kJ in a pulse each. Amplifiers are supplied from preamplifiers through 10 beam channels of 100-120 m length. In the ends of beam channels situated are stacker mirrors cousing and eliminating time delay of light pulses which are transmitted then to the Stokes amplifier. The perspectiveness of laser designs on the Xe2 molecule for pumping power laser on the OCSe molecule and chemical lasers on HF and oxygen-iodine is shown.

33017 **(KFK—3608) GORGON - a computer code for the calculation of energy deposition and the slowing down of ions in cold materials and hot dense plasmas.** Long, K.A.; Moritz, N.; Tahir, N.A. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Nov 1983. 150p. NTIS (US Sales Only), PC A07/MF A01. File Number DE85751642.

The computer code GORGON, which calculates the energy deposition and slowing down of ions in cold materials and hot plasmas is described, and analyzed in this report. This code is in a state of continuous development but an intermediate stage has been reached where it is considered useful to document the 'state of the art' at the present time. The GORGON code is an improved version of a code developed by Zinamon et al. as part of a more complex program system for studying the hydrodynamic motion of plane metal targets irradiated by intense beams of protons. The improvements made in the code were necessary to improve its usefulness for problems related to the design and burn of heavy ion beam driven inertial confinement fusion targets.

33018 **(KFK—3875) Stress and lifetime calculations for first wall and blanket structural components. Pt. 1.** Fett, T.; Munz, D. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Kernfusion). Jan 1985. 86p. NTIS (US Sales Only), PC A05/MF A01. File Number DE85751640.

In this report the lifetime of first wall and blanket structures of fusion reactors is investigated. The extension of small pre-existing cracks by the cyclic operation of a fusion reactor seems to be the most important failure mode. The special application of the present investigation are tubes acting directly as parts of the first wall and affected by various radiation effects. The outer surface is asymmetrically heated and by combination of thermal extension, swelling, irradiation creep and internal pressure a complex time dependent stress distribution results. Crack growth until failure caused by cyclic operation of the reactor is computed by application of fracture mechanical methods.

33019 **(LA-UR—85-1792) Determination of CTX equilibria.** Knox, S.O.; Barnes, C.W.; Marklin, G.J.; Jarboe, T.R.; Henins, I.; Hoida, H.W.; Wright, B.L. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 6p. (CONF-8505100—7). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012739.

From 7. US symposium on compact toroid research; Santa Fe, NM, USA (21 May 1985).

The method by which we determine the magnetic field equilibrium for CTX in a nonperturbing manner is presented. Measurements of flux conserver image currents are combined with calculations from a numerical model of the equilibrium. Results give equilibria which differ significantly from the minimum energy state, but the equilibria data are well-described by a model where j/B has a linear dependence on the poloidal flux function. The observation of non-disruptive rotating internal kink distortions (with toroidal mode numbers $n = 1$, 2 and 3) within the equilibria and theoretical MHD thresholds for the onset of these modes corroborate the inferred equilibria.

33020 **(LA-UR—85-1818) Energy efficiency of the CTX magnetized coaxial plasma source.** Fernandez, J.C.; Barnes, C.W.; Jarboe, T.R.; Knox, S.O.; Platts, D.A.; McKenna, K.F. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 5p. (CONF-8505100—2). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012735.

From 7. US symposium on compact toroid research; Santa Fe, NM, USA (21 May 1985).

The energy efficiency of the CTX coaxial plasma source in creating spheromaks is determined experimentally to be in agreement with the theoretical prediction of λ/sub sp//λ/sub g/, where del x B = λ/sub sp/ B in the spheromak, and λ/sub g/ identical with μ_0I/sub g//phi/sub g/ with I/sub g/ the source current and phi/sub g/ the magnetic flux through either source electrode. This is shown to be equivalent to magnetic helicity conservation. The spheromak impurity radiation was measured using an absolutely calibrated single chord bolometer system. The theoretical efficiency is within the experimental uncertainty of the ratio of spheromak radiated energy to source input energy in a group of "dirty" discharges. But the radiation measurement uncertainty is too large to determine whether a substantial part of the excess source energy not used in the production of spheromak magnetic energy is radiated from the spheromak volume.

33021 **(LBL—19136) H^- production in a multicusp microwave plasma.** Trow, J.R. (Lawrence Berkeley Lab., CA (USA)). Mar 1985. Contract AC03-76SF00098. 220p. NTIS, PC A10/MF A01; GPO Dep. File Number DE85011983.

Thesis.

An experiment was undertaken to examine H^- production by volume processes in a multicusp microwave discharge, part of the cusp field being enhanced to produce an ECR (electron cyclotron resonance), that would also isolate the hotter plasma formed there. This arrangement is analogous to the "magnetic filters" used in some other negative ion sources. This work describes the experiment set up and the results obtained, which are a survey of the behavior of this type of device. Also included is a discussion of the volume processes associated with H^- production including numerical estimates, based on the experimental measurements, which indicate H^- production is by dissociative attachment of cold electrons to vibrationally excited hydrogen molecules, and loss is by mutual neutralization with positive ions. The experimental observations are consistent with this model. These are also the same mechanisms used in the models of Bacal and Hiskes. Since magnetic fields generated by samarium cobalt permanent magnets were an important part of this experiment a set of field calculations was undertaken and is included.

33022 (LMF—113, pp 3-7) **Fusion reactor inhalation hazards: generation of lithium combustion aerosols.** Allen, M.D.; Greenspan, B.J.; Hoover, M.D. Dec 1984. NTIS, PC A23/MF A01. File Number DE85009283.

In Inhalation Toxicology Research Institute annual report, October 1, 1983-September 30, 1984.

A system was developed for generating lithium aerosols to determine the potential hazards of postulated accidents associated with the use of lithium as a fusion reactor blanket or coolant. The aerosol generation system produced well-controlled concentrations up to 2500 mg/m^3 for periods of four hours. Aerosols could be generated that were greater than 97% Li_2O and LiOH, $LiOH.H_2O$, or Li_2CO_3 by controlling the CO_2 and H_2O concentrations in the supply air. This system is currently being used to investigate the acute toxicity of lithium combustion aerosols in laboratory animals. 3 references, 3 figures.

33023 (LMF—113, pp 8-11) **Studies of beryllium aerosols in fusion-related systems.** Hoover, M.D.; Allen, M.D.; Greenspan, B.J.; Eidson, A.F.; Harmsen, A.G. Dec 1984. NTIS, PC A23/MF A01. File Number DE85009283.

In Inhalation Toxicology Research Institute annual report, October 1, 1983-September 30, 1984.

Beryllium particles produced in several industrial and research activities were investigated to aid in selecting appropriate aerosols for experiments designed to study the potential health hazards from using beryllium in fusion reactor systems. Aerosols of beryllium metal and beryllium oxide were obtained in an industrial machining operation, in laboratory studies using an electron beam and a laser beam, and in a research fusion device. Samples of stock beryllium metal and beryllium oxide powders were also examined. Particles of respirable size were found in all cases. Beryllium particles from powder metallurgy and the particles from machining beryllium metal were irregular in shape, typical of comminution processes. Particles produced at subatmospheric pressures in the electron beam and fusion devices were also irregular in shape and may have resulted from sputtering of beryllium by the plasma or the electron beam. The particles formed by laser vaporization at atmospheric pressure were branched-chain aggregates with individual particles appearing crystalline in shape. 4 references, 1 figure.

33024 (NIRS-M—41, pp 298-318) **Considerations for tritium protection at a fusion reactor.** Easterly, C.E. (Oak Ridge National Lab., TN (USA)). Mar 1982. NTIS (US Sales Only), PC A15/MF A01. File Number DE85781032. (CONF-811082—).

From Workshop on tritium radiobiology and health physics; Chiba, Japan (1 Oct 1981).

The view on the radiological hazard associated with future fusion power stations as presented in this discussion is rarely supported by reasonably certain or reliably accurate prediction. This fact should not be taken as indicating a major programmatic deficiency. In fact, it is expected that large uncertainty would be present in health effect at the current level of technological development. The details of tritium exposure will be clarified, waiting for the operation of the Tritium System Test Assembly. Once the data base for the TSTA is established, future fusion design can be made based on economic cost/radiation exposure risk benefit. The actual execution of this cost/benefit analysis is complex because three populations are of interest: occupational work force, local population and global population. The knowledge of tritium management must be increased if D-T fusion reactors are to become compatible with the needs of utility companies. In order to exploit the differing hazard between HT and HTO, it is necessary to know much more about the mechanism of uncatalyzed conversion over a wide range of concentration and about the change caused by the variety of potential catalytic sequence in potential tritium leak.

33026 (NRL-Memo—5591) **Operational window for a plasma erosion opening switch used for voltage multiplication on pulsed power generators.** Ottinger, P.F. (Naval Research Lab., Washington, DC (USA). Plasma Physics Div.). 5 Jun 1985. Contract AI08-79DP40092. 27p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85013088.

The Plasma Erosion Opening Switch (PEOS) is a fast opening switch which has been shown to be capable of conducting megampere-level currents before opening in <10 ns. Such a switch can be used for inductive storage in order to compress the output from conventional pulsed power generator in order to achieve voltage and power multiplication. An operational window is described herein which illustrates the voltage regime made accessible for a given machine by the switch.

33027 (ORNL/Sub—84-95128/1) **140 GHz gyrotron development program. Quarterly report No. 1, March-June 1984.** Felch, K.L.; Bier, R.E.; Craig, L.J.; Fiddaman, T.S.; Fox, L.J.; Hu, G.; Huey, H.E.; Jory, H.R.; Reysner, P.I.; Salop, A. (Varian Associates, Inc., Palo Alto, CA (USA)). 1984. Contract AC05-84OR21400. 83p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85011923.

The objective of this program is to develop a gyrotron oscillator capable of producing 100 kW of CW power at 140 GHz. Most aspects of the conceptual design for the first experimental tube are reported and initial calculations for several critical elements of the second experimental tube are discussed. The specification for the superconducting gyrotron magnet is presented. Finally, the various microwave components, protective devices and special diagnostics required to test the tubes are identified and their design summarized.

33028 (PPPL-Q—41) **Princeton Plasma Physics Laboratory annual report, October 1, 1982-September 30, 1983.** Phillips, C.A. (ed.). (Princeton Univ., NJ (USA). Plasma Physics Lab.). 1983. Contract AC02-76CH03073. 116p. NTIS, PC A06/MF A01; GPO Dep. File Number DE85011971.

The Tokamak Fusion Test Reactor (TFTR) achieved first plasma at 3:05 a.m. on December 24, 1982. During the course of the year, the plasma current was raised to a maximum of 1 MA, and extensive confinement studies were carried out with ohmic-heated plasmas. The most important finding was that tokamak energy confinement time increases as the cube of the plasma size. The Princeton Large Torus (PLT) carried out a number of high-powered plasma-heating experiments in the ion cyclotron frequency range, and also demonstrated for the first time that a 100-kA tokamak discharge can be built up by means of rf-waves in the lower hybrid range, without any need for inductive current drive by the conventional tokamak transformer system. The Poloidal Divertor Experiment (PDX) demonstrated that substantial improvements in plasma confinement during intense neutral-beam heating can be obtained by means of either a magnetic divertor or a mechanical scoop limiter. The S-1 spheromak experiment has come into operation, with first plasma in January 1983, and machine completion in August. The soft X-ray laser development experiment continues to make strong progress towards the demonstration of laser amplification. Thus far, a single-pass gain of 3.5 has been achieved, using the 182 A line of CVI. Theoretical MHD-stability studies have shed new light on the nature of the energetic-ion-driven "fishbone instability," and the utilization of the bean-shaping technique to reach higher beta values in the tokamak.

33029 (RAL—84-049) **Annual report to the Laser Facility Committee 1984.** (Rutherford Appleton Lab., Chilton (UK)). 1984. 377p. NTIS (US Sales Only), PC A17/MF A01. File Number DE85700996.

The report describes the work carried out at, or in association with, the Central Laser Facility (CLF), during the year ending March 1984. The CLF programme is divided into three main sections. The first, the glass laser scientific programme, is concerned with applications of the high power Nd glass laser. The second, the ultra violet radiation facility scientific programme, involves the excimer pumped frequency tunable lasers. The last, high power KrF laser development, describes Research and development work on this laser.

33030 (SAND—84-0159) Technical assessment of thermal-hydraulics for high heat flux fusion components. Boyd, R.D.; Wong, C.P.C.; Cha, Y.S. (Sandia National Labs., Albuquerque, NM (USA); GA Technologies, Inc., San Diego, CA (USA); Argonne National Lab., IL (USA)). Jan 1985. Contract AC04-76DP00789. 77p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85013178.

This report is a technical assessment of three possible thermal-hydraulic high heat flux (HHF) heat removal techniques which will result in adequate heat removal from fusion components with minimum penalty. The heat removal alternatives discussed in detail are: (1) subcooled flow boiling (SFB) with water; (2) high velocity helium gas convection (HGC); and (3) liquid metal (LM) heat transfer in the presence of a transverse magnetic field (TM). Advantages and disadvantages of each technique are delineated. Each heat removal technique is examined for a case study applicable to near-term fusion components such as limiters and divertors. Other HHF removal alternatives are briefly compared with these three alternatives. The results can be used, along with other fusion component performance constraints, to determine the research and development direction of generic problems such as HHF removal from fusion components in both near-term or existing fusion reactors (e.g., TFTR, TEXTOR, D-III, MFTF-B and compact reactors) and long-term or proposed reactors (e.g., TFCX and BCX). Specifically, comparisons are made for the selected case study of heat removal from a 1.5 m long, 1.0 cm diameter (inside) coolant channel which is subjected to a uniform steady-state heat flux of 0.5 kW/cm^2. The results show that SFB has the greatest heat removal capability, with the lowest coolant channel wall temperature and pumping power, followed by HGC and LMTM. Critical research and development needs for each HHF removal technique are also summarized.

33031 (SAND—84-1654) PMEXA: diagnostic filtering program for the PBFA-I performance monitoring and evaluation system. Phillips, A.R.; VanDevender, J.P. (Sandia National Labs., Albuquerque, NM (USA)). May 1985. Contract AC04-76DP00789. 84p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE85013179.

An automatic analysis program PMEXA has been developed to analyze and correlate the data on many PBFA I shots to determine the random timing variations, the systematic dependences of components on the operation of the previous stages, and the deviations of major components from normal operation. As an example, the analysis can uncover performance deviations of 1 to 2 ns out of data dominated by typically 3-ns standard deviation jitter, 3-ns standard deviation component defects, and 25% flow-through timing variations from previous stages. The defects are identified for operations personnel to investigate and, hence, the program filters the number of events that require attention.

33032 (SAND—84-2434C) Providing automated control for PBFA-II. Italiano, V.M. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 10p. (CONF-850616—10). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012867.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

Four levels of control are available to the operator in the Particle Beam Fusion Accelerator II (PBFA-II) control/monitor system. At the lowest control level, remote manual, the operator is responsible for all accelerator control and coordination. He is also responsible for interpreting sensor and actuator values to determine the state of the accelerator. At the highest control level, auto-staging, the computer integrates the sensor and actuator values into reports it presents to the operator. The operator can control several accelerator subsystems with single auto-staging commands that the control/monitor system interprets into sequences of integrated functions. The control system is being implemented from the bottom up, from remote manual to auto-staging - but will not be completed until well into the characterization phase of the PBFA-II project. Control action tasks are being integrated now with no major changes to the control/monitor design. Once the control action tasks are completely implemented no more changes are expected in the design. The higher level control systems should be easily implemented. This paper is an overview of the control/monitor system and will discuss each control level of the system.

33033 (SAND—84-2519C) Advances in data acquisition system technology for PBFA II. Boyer, W.B.; Bouchier, F.A.; Ezell, T.F.; Mattson, C.R.; Newcom, C.C. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 14p. (CONF-850616—30). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012860.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

The data acquisition system being built for PBFA II incorporates several new advanced technology features. The system will have 80 new waveform recorders with a 1.35 GHz sampling rate, 250 MHz bandwidth and 10,000 sample record length. A fast analog multiplexer will be used to enable recording multiple signals on each recorder. The accelerator performance monitor system will use time interval digitizers with a time window of +- 8 msec. This long window and the pretrigger feature will provide data for a thorough analysis of accelerator prefires. The calibration system will automatically route precision dc levels, sine waves and fast-rise pulses to the waveform recorders. The waveform recording system is being characterized using special multi-channel, high-level simultaneous pulse generators. The system computer has a 32-bit CPU, 350 Mbytes of disc storage and a virtual memory operating system. All software is being written in Fortran 77.

33034 (SAND—84-2520C) Operations considerations in designing a high speed multi-channel data acquisition system. Bouchier, F.A.; Mattson, C.R. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 13p. (CONF-850616—27). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012840.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

Several unique features are being implemented in the PBFA-II DAS. Set up efficiency has been improved by a cable harness that easily allows any of over 700 signals to be cabled to more than 100 waveform channels. Flexibility has been increased by a trigger and fiducial patch panel switching system that quickly enables any of the 18 triggers and fidus to be connected to any of the waveform channels. Reliability has been improved by a specially designed cooling system and a modular system design approach.

33035 (SAND—84-2523C) Model that predicts pulse charged gas switching breakdown phenomena. Martin, T.H. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 44p. (CONF-850616—21). NTIS, PC A03/MF A01; GPO Dep. File Number DE85013119.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

This paper uses the pulsed power switching data to develop a new model of gas switching. The extended model explains such diverse phenomena as prefire probabilities, breakdown voltages, triggered switching delays, triggered breakdown mechanisms, and effects of electrode surface finish on gap breakdown in pulse-charged switches.

33036 (SAND—84-2537C) Implementing the automated features of the PBFA-I control/monitor system. Spiller, J.L. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 16p. (CONF-850616—29). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012841.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

A control system is being provided for PBFA-I, an operational accelerator, to control subsystem functions such as sequencing of oil, water, gas, and vacuum controls, to coordinate charging and firing sequences, and to control safe and idle modes of the machine. Important design concepts in automating this system are: reliability, flexibility, and operability. Reliability is a primary criterion for executing single pulsed power and physics experiments as well as for supporting extended experimental series without a failure that would cause downtime. Flexibility to respond to changes in operating parameters and experimenter needs is being implemented in two major areas: a modular I/O system to provide hardware flexibility,

and structured software to ease software maintenance. Operability is increased with user-friendly software, and automatic sequencing.

33037 **(SAND—84-2559C) Supermite vacuum interface design.** Moore, W.B.; Stinnett, R.W.; McDaniel, D.H. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 12p. (CONF-850616—11). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012861.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

A new water-plastic-vacuum interface has been designed for Sandia Laboratory's Supermite (2.8 MV, 2.2 ohm) accelerator. This design was based on the PBFA I vacuum interface. Electrostatic field plots show that in positive polarity the water feed to the PBFA I interface will fail at 2 MV on Supermite. This is confirmed by positive polarity experiments and field plots using the PBFA I style vacuum interface at the Naval Research Labs. Modifications to the water section geometry to increase the water breakdown strength in positive polarity result in equivalent electric field grading at the plastic-vacuum interface but allow positive polarity operation at voltages up to 3.1 MV. This is accomplished by incorporating a dielectric field shaper which significantly improves the electric field grading across the insulator.

33038 **(SAND—84-2560C) Design and optimization of the PBFA II vacuum interface and transmission lines for light ion fusion.** McDaniel, D.H.; Stinnett, R.W.; Gray, E.W. (Sandia National Labs., Albuquerque, NM (USA); Cornell Univ., Ithaca, NY (USA)). 1985. Contract AC04-76DP00789. 22p. (CONF-850616—5). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012809.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

The PBFA II vacuum insulator was originally designed for optimum coupling to a proton ion diode with minimum inductance. In July 1983 it was decided that lithium ions at 30 MeV would be the baseline for PBFA II. This requires the use of Plasma Opening Switches (POS) and vacuum inductor to reach 30 MV. To achieve this, the vacuum magnetically insulated transmission lines had to be redesigned as an inductive energy store. To gain optimum coupling to this vacuum inductor, the output impedance of the water section was increased by the use of a water-dielectric transformer. The calculations leading to the final design will be discussed.

33039 **(SAND—85-0945C) Light ion sources for ICF.** Gerber, R.A.; Bieg, K.W.; Burns, E.J.T.; Dreike, P.L.; Maenchen, J.; Mehlhorn, T.A.; Olsen, J.N.; Pregenzer, A.L.; Rice, J.K.; Sweeney, M.A. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 11p. (CONF-850504—26). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011544.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

PBFA II, Sandia National Laboratories' (SNLA) advanced light-ion accelerator (now under construction), will deliver a 30-MV, 5 MA lithium ion beam to an Inertial Confinement Fusion (ICF) target. Although most ICF experiments have been performed with proton beams, lithium ions were selected for PBFA II for several reasons. The use of lithium enables a large anode-cathode spacing, resulting in less impedance change during the pulse. Lithium ions have less magnetic deflection in the diode, so they can be focused for a longer period of time. Also, since the ionization potential of Li^{+} is low, while that of L^{++} is very large, a Li^{+} source should be achievable without significant contamination from Li^{++}. Ions heavier than Li^{+} would require operating voltages greater than 30 MV, or the ions would have to be accelerated in a multiple charged state.

33040 **(UCID—20153) Helium-cooled molten-salt fusion breeder.** Moir, R.W.; Lee, J.D.; Fulton, F.J.; Huegel, F.; Neef, W.S. Jr.; Sherwood, A.E.; Berwald, D.H.; Whitley, R.H.; Wong, C.P.C.; Devan, J.H. (Lawrence Livermore National Lab., CA (USA); TRW Energy Development Group, Redondo Beach, CA (USA); GA Technologies, Inc., San Diego, CA (USA); Oak Ridge National Lab., TN (USA); Bechtel Group, Inc., San Francisco, CA (USA)). Dec 1984. Contract W-7405-ENG-48. 210p. NTIS, PC A10/MF A01; 1; GPO Dep. File Number DE85012833.

We present a new conceptual design for a fusion reactor blanket that is intended to produce fissile material for fission power plants. Fast fission is suppressed by using beryllium instead of uranium to multiply neutrons. Thermal fission is suppressed by minimizing the fissile inventory. The molten-salt breeding medium (LiF + BeF_2 + ThF_4) is circulated through the blanket and to the on-line processing system where ^{233}U and tritium are continuously removed. Helium cools the blanket and the austenitic steel tubes that contain the molten salt. Austenitic steel was chosen because of its ease of fabrication, adequate radiation-damage lifetime, and low corrosion by molten salt. We estimate that a breeder having 3000 MW of fusion power will produce 6500 kg of ^{233}U per year. This amount is enough to provide makeup for 20 GWe of light-water reactors per year or twice that many high-temperature gas-cooled reactors or Canadian heavy-water reactors. Safety is enhanced because the afterheat is low and blanket materials do not react with air or water. The fusion breeder based on a pre-MARS tandem mirror is estimated to cost $4.9B or 2.35 times a light-water reactor of the same power. The estimated cost of the ^{233}U produced is $40/g for fusion plants costing 2.35 times that of a light-water reactor if utility owned or $16/g if government owned.

33041 **(UCLA/PPG—860) ECH tokamak.** Firestone, M.A.; Mau, T.K.; Conn, R.W. (California Univ., Los Angeles (USA). Center for Plasma Physics and Fusion Engineering). Apr 1985. Contract AT03-80ER52061. 13p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012074.

A small steady-state tokamak capable of producing power in the 100 to 300 MWe range and relying on electron cyclotron RF heating (ECH) for both heating and current drive is described. Working in the first MHD stability regime for tokamaks, the approach adheres to the recently discovered maximum beta limit. An appropriate figure of merit is the ratio of the fusion power to absorbed RF power. Efficient devices are feasible at both small and large values of fusion power, thereby pointing to a development path for an attractive commercial fusion reactor.

33042 **(UCRL—15663) Microwave modeling of laser plasma interactions. Final report.** (TRW Defense and Space Systems Group, Redondo Beach, CA (USA)). Aug 1983. Contract W-7405-ENG-48. 33p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012970.

For a large laser fusion targets and nanosecond pulse lengths, stimulated Brillouin scattering (SBS) and self-focusing are expected to be significant problems. The goal of the contractual effort was to examine certain aspects of these physical phenomena in a wavelength regime ($\lambda \sim 5$ cm) more amenable to detailed diagnostics than that characteristic of laser fusion ($\lambda \sim 1$ micron). The effort was to include the design, fabrication and operation of a suitable experimental apparatus. In addition, collaboration with Dr. Neville Luhmann and his associates at UCLA and with Dr. Curt Randall of LLNL, on analysis and modelling of the UCLA experiments was continued. Design and fabrication of the TRW experiment is described under "Experiment Design" and "Experimental Apparatus". The design goals for the key elements of the experimental apparatus were met, but final integration and operation of the experiment was not accomplished. Some theoretical considerations on the interaction between Stimulated Brillouin Scattering and Self-Focusing are also presented.

33043 (UCRL—15672) Novette diagnostic support. Final report. Cirigliano, R.; Franco, E.; Koppel, L.; Rodrigues, B.; Smith, J. (Advanced Research and Applications Corp., Sunnyvale, CA (USA)). Feb 1985. Contract W-7405-ENG-48. 193p. NTIS, PC A09/MF A01; 1; GPO Dep. File Number DE85012937.

The primary research areas were the following: (1) contribute x-ray diagnostic, experimental, and data reduction and analysis support for the Novette DANTE x-ray spectrometer experiments. This effort was expanded to improve the overall quality of the Novette database; (2) experimental and calculational characterization of the x-ray imaging properties of an ellipsoidal x-ray collection optic serving as a sensitivity enhancing component of the Transmission Grating Streak Spectrometer; (3) performance simulation of the x-ray dispersion properties of candidate x-ray laser cavity, normal incidence end-mirror optics; (4) contribute x-ray diagnostic, experimental, and data reduction and analysis support for the Novette Henway crystal spectrometer and the MCPIGS microchannel plate intensified grazing incident spectrometer experiments; and (5) perform a technical performance vs cost evaluation of commercially available hardware required to perform the NOVA neutron time-of-flight experiments.

33044 (UCRL—91499-Rev.1) Ultraviolet radiation-damage absorption peak in solid deuterium-tritium. Revision 1. Fearon, E.M.; Tsugawa, R.T.; Souers, P.C.; Poll, J.D.; Hunt, J.L. (Lawrence Livermore National Lab., CA (USA); Guelph Univ., Ontario (Canada)). 1985. Contract W-7405-ENG-48. 8p. (CONF-850405—10-Rev.1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012969.

From 2. national topical meeting on tritium technology in fission, fusion and isotopic applications; Dayton, OH, USA (30 Apr 1985).

An ultraviolet absorption peak has been seen in solid deuterium-tritium and hydrogen-tritium at a sensor temperature of 5 K. The peak occurs at 3.6 eV and is about 1.5 eV wide. It bleaches out when the temperature is raised to about 10 K but reappears upon cooling and is, therefore, radiation induced. At 5 K, the peak forms on a time scale of minutes and appears to represent part-per-million levels of electron-mass defects. The suggested model is that of a trapped electron, where the peak is the ground state-to-the-conduction band transition. A marked isotope effect is seen between D-T and H-T.

33045 (UCRL—91968) Numerical studies of high current beam compression in heavy ion fusion. Bisognano, J.; Lee, E.P.; Mark, J.W.K. (Lawrence Berkeley Lab., CA (USA); Lawrence Livermore National Lab., CA (USA)). 10 May 1985. Contract W-7405-ENG-48. 5p. (CONF-850504—40). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011874.

From Particle accelerator conference; Vancouver, Canada (13 May 1985).

The process of longitudinal compression of a drifting heavy ion pulse to be used as an ICF driver is examined with the aid of particle simulation. Space charge forces play a vital role in halting compression before the final focus lens system is reached. This must take place with minimal growth of transverse emittance and momentum spread. Of particular concern is the distortion of longitudinal phase space by the rounded transverse profile of the longitudinal self-electric field.

33046 (UCRL—92538) Theoretical aspects of magnetic helicity. Hammer, J.H. (Lawrence Livermore National Lab., CA (USA)). 15 Apr 1985. Contract W-7405-ENG-48. 12p. (CONF-8503137—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011846.

From IAEA technical committee meeting on advances in compact toroid research; Sydney, Australia (4 Mar 1985).

33047 Particle simulations of the low-α Pierce diode. Crystal, T.L.; Kuhn, S. (Electronics Research Laboratory, University of California, Berkeley, California 94720). *Physics of Fluids;* **28**: No. 7, 2116-2124(Jul 1985). Contract AT03-76ET53064.

The evolution of small initial perturbations of the uniform equilibrium of the "classical" Pierce diode [J. Pierce, J. Appl. Phys. 15, 721 (1944)] is studied using particle simulations. These simulations have been performed with the new bounded-plasma code PDW1 [Wm. S. Lawson (private communication)] and cover the parameter range $0<\alpha<3\pi$, where $\alpha = \omega$/sub p/L/v_0. In the linear regime, three stages (initial transit, adjustment, and dominant eigenmode) are distinguished; oscillation frequencies, growth/damping rates, and potential profiles of the dominant eigenmode as well as oscillation frequencies of the next-to-dominant eigenmode are recovered and shown to agree quantitatively with recent analytical results. In the linearly unstable cases, the system evolves nonlinearly to a final state which may be either a new, nonuniform dc equilibrium, or a state of large-amplitude oscillations. In particular, for $\alpha = 1.5\pi$ the character of the final state is found to depend on the details of the initial conditions.

33048 Magnetic alignment of the Tara tandem mirror. Post, R.S.; Coleman, J.W.; Irby, J.H.; Olmstead, M.M.; Torti, R.P. (Plasma Fusion Center, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Review of Scientific Instruments;* **56**: No. 6, 1139-1150(Jun 1985).

Techniques developed for the alignment of high-energy accelerators have been applied to the alignment of the Tara tandem mirror magnetic confinement device. Tools used were: a transit/laser surveyor's system for establishing an invariant reference; optical scattering from ferromagnetic crystallites for establishing magnetic centers in the quadrupole anchor/transition modules; an electron-optical circle-generating wand for alignment of the solenoidal plug and central cell modules; and four differently configured electron emissive probes, including a 40-beam flux mapping e gun, for testing the alignment of the coils under vacuum. Procedures are outlined, and results are given which show that the magnetic axes of the individual coils in the Tara set have been made colinear with each other and with the reference to within +- 1.0 mm over the length of the machine between the anchor midplanes.

33049 Repeating pneumatic hydrogen pellet injector for plasma fueling. Combs, S.K.; Milora, S.L.; Foust, C.R.; Foster, C.A.; Schuresko, D.D. (Lawrence Livermore National Laboratory, University of California, P.O. Box 808, Livermore, California 94550). *Review of Scientific Instruments;* **56**: No. 6, 1173-1178(Jun 1985). Contract AC05-84OR21400.

A repeating pneumatic pellet injector has been developed for plasma fueling applications. The repetitive device extends pneumatic injector operation to steady state. The active mechanism consists of an extruder and a gun assembly that are cooled by flowing liquid-helium refrigerant. The extruder provides a continuous supply of solid hydrogen to the gun assembly, where a reciprocating gun barrel forms and chambers cylindrical pellet from the extrusion; pellets are then accelerated with compressed hydrogen gas (pressures up to 125 bar) to velocities < or =1.9 km/s (1.6 km/s for deuterium pellets). The gun assembly design can accommodate different pellet sizes and barrel lengths. Steady-state rates of 2 s^{-1} have been obtained with 2.1- , 3.4- , and 4.0-mm-diameter pellets. The present apparatus operates at higher firing rates in short bursts; for example, a rate of 6 s^{-1} for 2 s with the larger pellets. These pellet parameters are in the range applicable for fueling large present-day fusion devices such as the Tokamak Fusion Test Reactor (TFTR). Experimental results are presented, including effects of propellant pressure and barrel length on gun performance.

33050 MARS: Mirror Advanced Reactor Study. Logan, B.G. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1129-1133(May 1985). Contract W-7405-ENG-48.

A recently completed 2-year study of a commercial tandem mirror reactor design [Mirror Advanced Reactor Study (MARS)] is briefly reviewed. The end plugs are designed for trapped particle stability, stability against MHD ballooning modes, balanced geodesic curvature, and small radial electric fields in the central cell. New technologies such as lithium-lead blankets, 24T hybrid coils, gridless direct converters, and plasma halo vacuum pumps are highlighted.

33051 **Measurement of the wall radiation in soft x-ray region in PDX (abstract).** Sesnic, S.; Tenney, F.H.; Bitter, M.; Hill, K.W.; von Goeler, S. (Princeton University, Plasma Physics Laboratory, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **56**: No. 5, 847-847(May 1985).

A detector setup with three LN-cooled Si(Li) diodes is used to measure soft x-ray spectra (0.8—20 keV) emitted from the inside walls of the PDX vessel during the plasma discharge. The setup is part of a pulse-height-analysis system, which is used to measure the plasma and wall radiation simultaneously at five different radial positions. The wall and the plasma radiation are measured under different plasma conditions (e.g., OH and neutral beam heating). The wall radiation is very much increased during the neutral beam heating, with an enhancement factor of at least 10 over the OH wall radiation. Since we measure the plasma and the wall radiation at the same time, the measurements allow the conclusion that the wall radiation can be attributed essentially to fluorescence (line radiation, e.g., Ti-K/sub α/) and scattering (continuum part of the wall radiation spectrum). The fluorescence and the scattering are both caused by soft x-ray radiation flux coming from the plasma. There seems to be no need to invoke other, more exotic causes for the wall radiation, for example, charge particle bombardment of the wall.

33052 **Neutral beam injector oxygen impurity measurements and concentration reduction via gettering processes.** Kane, R.J.; Hsu, W.L.; Kerr, R.G.; Mills, B.E.; Poulsen, P.; Hibbs, S. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1081-1084(May 1985). Contract W-7405-ENG-48.

We have measured the reduction of oxygen impurity levels by means of gettering within the arc chambers of the TMX-U neutral-beam injectors using the TMX-U neutral-beam test stand. Our analysis incorporated silicon surface-probe measurements and optical Doppler-shift measurements of the hydrogen alpha spectra of deuterium atoms with energies appropriate for D_2O parentage. Without gettering, the Auger electron spectroscopy analysis of an exposed silicon sample showed a large oxygen peak below the surface peak with a concentration equivalence of approximately 2% for an accelerated beam. After gettering, with either titanium or chromium getters, optical monochromator data indicated a reduction in the oxygen concentration of at least a factor of 10, whereas Auger spectroscopy data showed at least a factor of 8 reduction. Other metallic impurities remained below the level of detection even after gettering. Additional effects observed during this study include a change in the accelerated deuterium species concentrations, loss of gettering activity, loss of arc operation, and a change in arc performance due to arc chamber gas absorption during operation.

33053 **Status of TFTR with Ohmic heating and neutral beam injection.** Grove, D.J. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1145-1150(May 1985). Contract AC02-76CH03073.

The main body of the paper addresses the current status of the Tokamak Fusion Test Reactor (TFTR) as of December 1984, with emphasis on the vacuum and surface physics aspects of its operation. A brief review is given of the first paper on the vacuum aspects of controlled fusion research to be presented to a Symposium of the American Vacuum Society. This was given at the Fifth Symposium in October 1958 by the author of this paper. A comparison is made of the devices of that time with TFTR. The vacuum vessel diameter has gone from 2 in. to 7 ft., the plasma durations from 2 ms to many seconds, and the energy confinement time has increased by a factor of 1000 to 0.4 s. TFTR plasmas have reached densities of 4×10^{13} cm^{-3} with electron and ion temperatures of 3 keV. Very preliminary results, with the injection of only 2 MW of 50—70 keV neutral hydrogen into deuterium plasma, show the expected ion heating and increase in neutron flux. These experiments also show roughly a 30% reduction in the energy confinement time from that of plasmas with only Ohmic heating, as has been noted in other tokamaks. Attention is called to the continuing importance of impurity control in fusion devices.

33054 **Halo plasma heating by neutral beam injection in TMX-U.** Hsu, W.L.; Bauer, W.; Kerst, R.A.; Wilson, K.L.; Simonen, T.C.; Foote, J.H.; Pickles, W.L. (Sandia National Laboratories, Livermore, California 94550). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1175-1178(May 1985).

The electron temperature and density of the halo in TMX-U have been measured by Langmuir probes to study the heating of the halo plasma by neutral beam injection. This study is motivated by the recent interest in using a pair of halo recyclers to enhance the halo density and thereby increase halo shielding. In present TMX-U operation, without halo recyclers, a halo density of 2×10^{12} cm^{-3} with electron temperature of 20 eV has been measured during the heating phase with neutral beam injection only. A halo power balance model incorporating several heating mechanisms resulting from neutral beam injection is described. The model accurately predicts the measured temperatures. At the halo density range that one expects to achieve with halo recyclers, the model predicts the existing TMX-U neutral beam sources to heat the halo to at least 30 eV.

33055 **Development of rf plasma generators for neutral beams.** Vella, M.C.; Ehlers, K.W.; Kippenhan, D.; Pincosy, P.A.; Pyle, R.V.; DiVergilio, W.F.; Fosnight, V.V. (Lawrence Berkeley Laboratory, Berkeley, California 94720). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1218-1221(May 1985). Contract W-7405-ENG-36.

The development of low frequency (1—2 MHz) rf plasma generators for high power neutral beam applications is summarized. Immersed couplers from one to three turns were used. Acceptable plasma profiles, < or =15% max/min, were obtained in a variety of field-free, magnetic bucket and magnetic filter-bucket sources, with 10 x 10 or 10 x 40 cm extraction areas. Hydrogen beam properties were measured with a 7 x 10 cm accelerator operated at 80 kV. Atomic fraction and power efficiency were at least as high as with arc plasmas in similar chambers. The potential advantages of an rf plasma source are: ease of operation; reliability; and extended service lifetime.

33056 **Noncontact thermal gradient method for fabrication of uniform cryogenic inertial fusion target.** Kim, K.; Mok, L.; Erlenborn, M.J.; Bernat, T.P. (Fusion Technology Laboratory, University of Illinois, Urbana, Illinois 61801). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1196-1200(May 1985).

A new method for fabricating a uniform layer of fuel condensate inside a spherical-shell inertial confinement fusion target is described. In this method, target cooling is done in a vertically imposed temperature gradient whose magnitude is continuously controlled until the thermally induced effects precisely counterbalance the gravity effect. As a consequence, gravity-induced fuel sagging is completely eliminated resulting in the formation of a uniform fuel-condensate layer on the inner surface of the target. Since the present method is immune to the gravity effect, it is uniquely qualified for fabricating targets containing a thick fuel layer: an important capability no other existing method possesses. A brief description of the experimental methods and the preliminary results showing the promise of the new method are presented.

33057 **Thickness uniformity measurements of plastic-coated glass shells by image analysis of x-ray radiographs.** Alexander-True, S.M.; True, M.A. (KMS Fusion, Inc., Ann Arbor, Michigan 48106). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **3**: No. 3, 1258-1261(May 1985).

Digitized x-ray radiographs of plastic-coated glass shells were analyzed for thickness uniformity. The glass shells were 2 μ thick with a radius of 100 μ and the plastic coating was 20 μ thick. Nearly circular contours of image intensity for the inner edge of the glass shell and the outer edge of the plastic coating were constructed. The difference between the contour radii (the thickness of the glass and plastic) was interpolated on an evenly spaced angular grid along the circumference. The thickness was Fourier analyzed with respect to the angle variable. Low angular frequency perturbations which characterize large scale thickness nonuniformity were observed.

33058 **Effective hydrogen gas temperature in a cryopumped beam line vessel.** Kim, J.; Fasolo, J.A. (GA Technologies, Inc., San Diego, California 92138). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* 3: No. 3, 551-552(May 1985). Contract AT03-80SF11512.

Thermal accommodation of hydrogen gas molecules to cold surfaces modifies the effective gas temperature in cryogenically pumped vacuum vessels. In Doublet III neutral beam lines, gas pumping is achieved by liquid-helium-cooled panels which are surrounded by liquid-nitrogen-cooled thermal shields. By measuring the gas pressure during the injection of a known amount of gas while cooling the thermal shields by liquid nitrogen, we have determined the effective gas temperature according to $T/T_0 =$ (P/sub i//P/sub i/o)^2, where P/sub i/ is the pressure monitored by an ionization gauge and the subscript o refers the case of room temperature. The effective gas temperature was determined to be about 150 K when only the thermal shields were cooled down to the liquid nitrogen temperature. Implications of the reduced gas temperature on pressure measurement, pumping speed measurement, and neutral beam reionization loss calculation are discussed.

33059 **Experimental measurements of melting and vaporization due to simulated plasma disruptions.** Easoz, J.R.; Bajaj, R. (Westinghouse Advanced Energy Systems Division, Madison, Pennsylvania 15663). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* 3: No. 3, 1119-1124(May 1985). Contract AC02-83ER52094.

The first wall and limiter surfaces of magnetic confinement fusion devices will be subjected to intense pulsed thermal loads due to plasma disruptions which can result in vaporization and melting limiting the lifetime of these components. This paper presents experimental data on the vaporization and melting of AXF-5Q graphite, Type 316 stainless steel, OFHC copper and tantalum due to thermal loads varying up to 2400 J/cm^2 applied for times between 1 and 50 ms. The surface thermal loads were simulated with a 120-keV electron beam in the electron beam surface heating (ESURF) facility. The analysis procedure consisted of determining vaporization losses through weight-loss measurements and evaluation of the melt zone thickness through a metallographic sectioning procedure. Comparisons with some of the more recent theoretical predictions are made. The data trends (i.e., increasing melt and vaporization with energy density, existence of threshold energy densities, and melt thickness limits at high energy density due to increased vaporization) are generally found to agree with the analytical predictions. However, the magnitude of the melt zone thicknesses and vaporization losses show differences significant enough to warrant investigation of both modeling assumptions and the experimental techniques and conditions.

33060 **Plasma modeling of MFTF-B and the sensitivity to vacuum conditions.** Porter, G.D.; Rensink, M. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* 3: No. 3, 1157-1160(May 1985). Contract W-7405-ENG-48.

The tandem mirror machine, MFTF-B, is scheduled to begin operation early in 1987. We have developed a time-dependent plasma-modeling code to examine the expected operating parameters. Using this code, we studied the effect of vacuum conditions on the plasma in each region of the machine. In particular, this study specified the vacuum requirements to which the machine is being designed. We will present the details of our study together with the current design of the vacuum system.

33061 **Nuclear microprobe and its applications to controlled fusion research.** Doyle, B.L. (Sandia National Laboratories, Ion—Solid Interactions Division 1111, Albuquerque, New Mexico 87185). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* 3: No. 3, 1374-1379(May 1985). Contract AC04-76DP00789.

A nuclear microprobe analysis system attached to Sandia's EN tandem Van de Graaff accelerator is described. A magnetic quadrupole doublet lens is used for the final focus to obtain beams of 2 μm diameter. Several illustrative applications of the microprobe involving its use in the 1D, 2D, and 3D profiling analysis of fusion reactor components are given.

33062 **Transparent electrode for optical switch.** Goldhar, J.; Henesian, M.A. (to Dept. of Energy). US Patent Application 6-662,641. 19 Oct 1984. 20p. Contract W-7405-ENG-48.

The invention relates generally to optical switches and techniques for applying a voltage to an electro-optical crystal, and more particularly, to transparent electodes for an optical switch. System architectures for very large inertial confinement fusion (ICF) lasers require active optical elements with apertures on the order of one meter. Large aperture optical switches are needed for isolation of stages, switch-out from regenerative amplifier cavities and protection from target retroreflections.

33063 **Electro-optic harmonic conversion to switch a laser beam out of a cavity.** Haas, R.A.; Henesian, M.A. (to Dept. of Energy). US Patent Application 6-662,642. 19 Oct 1984. 28p. Contract W-7405-ENG-48.

The present invention relates to switching laser beams out of laser cavities, and more particularly, it relates to the use of generating harmonics of the laser beam to accomplish the switching. When laser light is generatd in a laser cavity the problem arises of how to switch the laser light out of the cavity in order to make use of the resulting laser beam in a well known multitude of ways. These uses include range finding, communication, remote sensing, medical surgery, laser fusion applications and many more. The switch-out problem becomes more difficult as the size of the laser aperture grows such as in laser fusion applications. The final amplifier stages of the Nova and Novette lasers at Lawrence Livermore National Laboratory are 46 centimeters with the laser beam expanded to 74 centimeters thereafter. Larger aperture lasers are planned.

33064 **Limiter.** Cohen, S.A.; Hosea, J.C.; Timberlake, J.R. (to Dept. of Energy). US Patent Application 6-662,645. 19 Oct 1984. 13p. Contract AC02-76CH03073.

A limiter with a specially contoured front face is provided. The front face of the limiter (the plasma-side face) is flat with a central indentation. In addition, the limiter shape is cylindrically symmetric so that the limiter can be rotated for greater heat distribution. This limiter shape accommodates the various power scrape-off distances λ p, which depend on the parallel velocity, V/sub parallel/, of the impacting particles.

33065 **Cost assessment of a generic magnetic fusion reactor.** Sheffield, J.; Dory, R.A. (Oak Ridge National Laboratory, Martin Marietta Energy Systems, Inc., Oak Ridge, Tennessee). *Proceedings, Intersociety Energy Conversion Engineering Conference;* 3: 1567-1569(Aug 1984). (CONF-840804—).

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

A generic magnetic fusion reactor model is used to determine the conditions under which electricity generation from fusion would be economically viable. The use of a generic model helps to circumvent problems associated with present perceptions of magnetic configurations. It helps also to decouple those limitations set by generic constraints such as nuclear cross sections from those set by the state of development today. The model shows that only moderate advances are required in reactor characteristics over current designs to make an economically attractive magnetic fusion reactor.

33066 **Inertial confinement fusion: Present status and future potential.** Hogan, W.J. (Lawrence Livermore National Laboratory). *Proceedings, Intersociety Energy Conversion Engineering Conference;* 3: 1560-1565(Aug 1984). (CONF-840804—).

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Power from inertial confinement fusion holds much promise for society. This paper points out many of the benefits relative to combustion of hydrocarbon fuels and fission power. Potential problems are also identified and put in perspective. The progress toward achieving inertial fusion power is described and results of recent work at the Lawrence Livermore National Laboratory are presented. Key phenomenological uncertainties are described and experimental goals for the Nova laser system are given. Several ICF reactor designs are discussed.

33067 **Surface melting and evaporation during disruptions in magnetic fusion reactors.** Hassanein, A.M. (Argonne National Lab., IL (USA)); Kulcinski, G.L.; Wolfer, W.G. (Wisconsin Univ., Madison (USA). Dept. of Nuclear Engineering). *Nuclear Engineering and Design/Fusion;* 1: No. 3, 307-324(Jul 1984).

Disruptions in tokamaks lead to high energy deposition for short times on in-vessel components. Melting and evaporation may then occur. A comprehensive model to evaluate the extent and duration of melting, the amoung of evaporation, and the time for resolidification is presented. This model entails the solution of a heat conduction problem with two moving boundaries, the liquid surface and the melt-solid interface with a surface boundary condition determined by the dynamics of evaporation. Extensive numerical results are presented for in-vessel components made of stainless steel, molybdenum, or graphite. The effects of vapor shielding, pulse shape, and pulse duration are also investigated.

99 GENERAL AND MISCELLANEOUS

33068 **(BNL—35652) Re-analysis of Boston materials inventory.** Daum, M.L.; Lipfert, F.W. (Brookhaven National Lab., Upton, NY (USA)). Oct 1984. Contract AC02-76CH00016. 28p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012993.

In 1978 the Electric Power Research Institute (EPRI) contracted with TRC Environmental Consultants, Inc., to develop an inventory of exposed man-made (structural) surfaces in Boston. Previous studies have used production statistics and population distribution patterns to estimate the areal distribution of exposed materials. The EPRI/TRC inventory was designed to determine the validity of this approach by directly estimating quantities of exposed materials in a typical northeastern city, the Boston SMSA. Among its findings in the EPRI report, TRC noted that most materials are not uniformly distributed even at a neighborhood scale. Purpose of this reanalysis was to determine if the distributions and/or the amount of exposed materials as inventoried in the Boston area are related to some land use, demographic, or economic factors.

33069 **(DOE/ER—0165/2) Nuclear engineering enrollment and degrees, 1984: data summary.** Sweeney, D.H.; Shirley, D.L. (Oak Ridge Associated Universities, Inc., TN (USA)). Mar 1985. Contract AC05-76OR00033. 68p. NTIS, PC A04/MF A01 - GPO; GPO Dep. File Number TI85013258.

The 1984 nuclear engineering survey included 71 academic institutions. Sixty-six responded that they have active programs. Enrollments at all degree levels decreased in 1984 from 1983. Undergraduates and master's candidate enrollments decreased by 3% each, and doctoral enrollments decreased by slightly less than 1%. Bachelor's degrees awarded in 1984 increased from 674 in 1983 to 728. Doctoral degrees awarded also increased over the past year from 124 to 132. Master's degrees awarded decreased from 325 to 316, 19% of the bachelor's went to work for nuclear utilities, while 18% elected to continue their studies. Continued study represented the largest placement category for master's (29%). Nuclear utilities (15%) and other industrial (14%) were reported as employing the most master's. Placement for the largest portion (20%) of Ph.D.s was unknown. Other industrial was the largest employer of Ph.D.s (19%); and US academic was the second largest employer of Ph.D.s (14%). The largest placement category reported for foreign national bachelor's and master's was continued study. Nineteen percent (23 out of 123) of the master's foreign nationals went to work in foreign countries. Foreign employment was also the largest placement category for Ph.D.s. Other statistical data breakdowns include women and minorities, and regional distribution.

33070 **(DOE/OR/21400—T101) Politics of schism: routinization and social control in the International Socialists/ Socialist Workers' Party.** Rayner, S. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 29p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85008358.

The received wisdom of social science holds that voluntary organizations founded on egalitarian principles, can only survive by undergoing transformation into hierarchical systems. The underlying logic of Weber, Michels and Toennies' descriptions is that social organizations sustain themselves over time by generating increasingly complex systems of rules that become sources of inequality. This article argues that routinization in voluntary groups does not consist of a gradual accumulation of rules that promote internal inequality. Instead, two analytically distinct steps are proposed: (1) construction of a distinctive organizational boundary, which is a necessary condition for (2) the ultimate imposition of a complex organizational hierarchy. The case used to illustrate this argument is drawn from the history of the British Trotskyist movement prior to 1978. The argument itself is framed within a formal model of the sociology of knowledge called grid/group analysis.

33071 **(DPST—85-1-3) Savannah River Laboratory monthly report.** (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Mar 1985. Contract AC09-76SR00001. 17p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011047.

Reported are: seismic evaluation of L Reactor; target slug identification technique; management of control rods in Mark 22 operation; VENTSAR: a computer code to determine near-in dispersion for postulated SAR accidents; soil gas survey technique for locating organic contamination; prototype FB-Line multipurpose filter pans; evaluation of solvent extraction computer models; waste glass dissolution; analytical requirements for the Fuel Production Facility; solubility of deuterium in austenitic alloys; electrolytic reduction of nitrate and nitite salts; and radio communication for hazardous environments.

33072 **(GAO/RCED—85-25) Bureau of Reclamation could identify more unneeded land.** (General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div.). 12 Apr 1985. 71p. General Accounting Office, P.O. Box 6015, Gaithersburg, MD 20877. File Number TI85901574.

A January 1983 Bureau of Reclamation report identified about 1.3 million acres of land as unneeded for project purposes. That report, however, did not include 472,600 acres which GAO subsequently identified as unneeded. This occurred primarily because Reclamation's annual property reviews did not include detailed reviews of specific parcels of land and it had not completed reviewing the need for all public domain land under its jurisdiction. Recognizing the need to improve its land management program, Reclamation has been implementing a land-use inventory and automated real property asset management system. This could help Reclamation develop a comprehensive and accurate inventory of land no longer needed for project purposes. Normally, proceeds from the sale of unneeded land are used to reduce the financial obligations of irrigation districts. In this respect, three irrigation districts at the Columbia Basin Project in Washington could receive reductions in their repayment obligations of about $39 million if 73,000 acres of unneeded land are sold. The land was purchased by the federal government in the early 1940's for other than water project purposes. GAO recommends that Reclamation consider whether the federal government's interests in this land outweigh the irrigation districts' asserted contractual, reliance, and equitable interests and refrain from selling additional settlement land until a determination is reached.

33073 **(IA—1404) Research laboratories annual report 1983.** (Israel Atomic Energy Commission, Tel Aviv). Jul 1984. 287p. NTIS (US Sales Only), PC A13/MF A01. File Number DE85780940.

33074 **(AEC—652) Report on applications of nuclear science in New Zealand, 1981-1982.** (New Zealand Atomic Energy Committee, Lower Hutt). Oct 1982. 142p. NTIS (US Sales Only), PC A07/MF A01. File Number DE85701524.

This report describes the more important applications of nuclear science at various centres in New Zealand with emphasis on those involving research or new developments. The work within the Government departments, universities, hospitals and industry is summarized, and this is followed by the main reports.

33075 **(AECL—7683) Progress report: Physics Division, 1982 January 1 to March 1.** (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). May 1982. 137p. (PR-P—133). NTIS (US Sales Only), PC A07/MF A01. File Number DE85701525.

The work of the Physics Division at Chalk River Nuclear Laboratories during the quarter is presented. Areas of interest include nuclear physics, neutron sources, the development of a superconducting cyclotron, high current proton accelerators and electron accelerators, diffraction studies and other solid state physics work in organic and inorganic substances, and computer codes. The operation of the MP tandem accelerator and the computer facilities is reviewed.

33077 **(AD-A—150513/0/XAB) Parallel processing for computational continuum dynamics.** McGrath, J.F.; Hicks, D.L.; Liebrock, L.M. (KMS Fusion, Inc., Ann Arbor, MI (USA)). Jan 1985. 23p. (KMSF-U—1539). NTIS, PC A02/MF A01.

The numerical solution of many problems in continuum dynamics is seriously limited by the computation rates attainable on computers with serial architecture. Parallel-processing machines can achieve much higher rates. However, applying additional processors to a calculation is only part of the solution. In this report, parallel algorithms are developed for explicit and implicit, Lagrangian and Eulerian finite-difference schemes for computational continuum dynamics in one spatial dimension. First, the explicit conservation equations in the Lagrangian reference frame are readily reformulated for concurrent processing. Second, and implicit solution is derived for these equations. This is important because it yields unconditional stability. The parallelism is achieved via a block implicit numerical scheme. Third, a rezoning algorithm is employed with each Lagrangian integration step to transform the mesh back to the Eulerian reference frame. Along the algorithmic development path, a zone-by-zone parallelization gives way to a block-by-block technique both of which are self-scheduling. Then the latter is compared to an approach that keeps the parallel processes alive for many time steps. At each step of this research exploiting the architectural advantages of the HEP H1000 (Heterogeneous Element Processor) computer.

33078 **(AD-A—151376/1/XAB) Supercomputers and symbolic computation. Technical report for period ending 4 June 1984.** Arnon, D.S. (Purdue Univ., Lafayette, IN (USA). Dept. of Computer Science). 31 Dec 1984. 30p. NTIS, PC A03/MF A01.

This report is the record of a two-day workshop held at Purdue University on high-performance symbolic computation. The title reflects the interests of the participants, many of whom are practitioners of symbolic computing on supercomputer-class machines. The goal of the workshop was to assess the current state of affairs, and identify key issues requiring attention. The report is primarily a compendium of the positions taken, recommendations made, and questions raised by the participants.

33079 **(AD-A—151504/8/XAB) BLAS (Basic Linear Algebra Subroutines), linear algebra modules, and supercomputers. Technical report for period ending 15 December 1984.** Rice, J.R. (Purdue Univ., Lafayette, IN (USA). Dept. of Computer Science). 31 Dec 1984. 17p. NTIS, PC A02/MF A01.

On October 29 and 30, 1984 about 20 people met at Purdue University to consider extensions to the Basic Linear Algebra Subroutines (BLAS) and linear algebra software modules in general. The need for these extensions and new sets of modules is largely due to the advent of new supercomputer architectures which make it difficult for ordinary coding techniques to achieve even a significant fraction of the potential computing power. The workshop format was one of informal presentations with ample discussions followed by sessions of general discussions of the issues raised. This report is a summary of the presentations, the issues raised, the conclusions reached and the open issue discussions. Each participant had an opportunity to comment on this report, but it also clearly reflects the author's filtering of the extensive discussions. Section 2 describes seven proposals for linear algebra software modules and Section 3 describes four presentations on the use of such modules. Discussion summaries are given next; Section 4 for those where near concensus was reached and Section 5 where the issues were left open.

33080 **(AD-A—151970/1/XAB) Complexity of dense linear system solution on a multiprocessor ring. Research report.** Ipsen, I.C.F.; Saad, Y.; Schultz, M.H. (Yale Univ., New Haven, CT (USA). Dept. of Computer Science). Jan 1985. 29p. (YALEU/DCS/RR—349). NTIS, PC A03/MF A01.

Different algorithms, based on Gaussian elimination, for the solution of dense linear systems of equations, are discussed for a multiprocessor ring. The number of processors is assumed not to exceed the problem size. A fairly general model for data transfer is proposed and the algorithms are analyzed with respect to their requirements of arithmetic as well as communication times. This paper lays no claims to being either exhaustive or complete. Its objective is to compare a variety of algorithms, which are fairly reasonable to program and to analyze, for the solution of a single problem on a certain class of parallel architectures, thereby leading to a more realistic approach to future algorithm development on multiprocessor machines.

33081 **(AD-A—152095/6/XAB) Optimal parallel algorithms for graph connectivity. Technical report.** Reif, J.H. (Harvard Univ., Cambridge, MA (USA). Aiken Computation Lab.). 1984. 25p. (TR—08-84). NTIS, PC A02/MF A01.

A new randomized parallel RAM algorithm is given for finding a spanning forest of an undirected graph in logarithmic time. These time bounds hold with arbitrary high probability for any input graph (i.e., assume random input is not assumed; these bounds hold for the worst case input graph). This result assumes a parallel RAM model which allows both concurrent writes and concurrent reads. Furthermore, it is shown that if the graph is not very sparse (i.e., if the number of edges is at least a logarithmic squared factor more than the number of vertices) then a linear processor time product (even for logarithmic time bounds) can be achieved for finding a spanning tree--which is optimal for the parallel RAM model. Furthermore, a linear-processor, time product can be achieved for even sparser graphs with only slight time increase.

33082 **(CONF-830116—4) Accelerating nonsymmetrizable iterative methods.** Young, D.M.; Jea, K.C.; Kincaid, D.R. (Texas Univ., Austin (USA). Center for Numerical Analysis). Mar 1983. Contract AS05-81ER10954. 22p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012471.

From Conference on elliptic problem solvers; Monterey, CA, USA (10 Jan 1983).

The object of this paper is to describe some recent work which has been done at The University of Texas at Austin and elsewhere on the development of procedures for accelerating nonsymmetrizable iterative methods. Approaches which we discuss include the use of the GCW method of Concus and Golub [1976] and of Widlund [1978], the use of the normal equations and related equations, Chebyshev acceleration, and some generalized CG acceleration procedures. Normally, the generalized CG acceleration procedures, in their idealized form, are too expensive in terms of computer time and storage for practical use. In the symmetrizable case the formulas simplify since many of the terms vanish. In some nonsymmetrizable cases, it is possible to achieve similar simplifications. We describe work on such simplifications done by Jea [1982] and Jea and Young [1983] as well as work of Faber and Manteuffel [1983]. We also show that the simplifications of Jea and Young [1983] can be used to derive three alternative forms of the Lanczos method (see Lanczos [1950, 1952]). A theoretical basis is given for choosing one of the forms in preference to the other two more frequently used forms.

33083 **(CONF-830116—5) ITPACK project: past, present, and future.** Kincaid, D.R.; Young, D.M. Jr. . (Texas Univ., Austin (USA). Center for Numerical Analysis). Mar 1983. Contract AS05-81ER10954. 12p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012470.

From Conference on elliptic problem solvers; Monterey, CA, USA (10 Jan 1983).

The ITPACK project involves the development of research-oriented mathematical software, based on iterative algorithms, for solving large systems of linear algebraic equations with sparse coefficient matrices. The emphasis is on linear systems arising in the solution of partial differential equations by discretizations such as finite difference or finite element methods. Among other things this project has resulted in the development of a package of subroutines known as ITPACK which is available to the scientific community. Important features of the ITPACK routines include the adaptive determination of the iteration parameters and realistic procedures for terminating the iterative processes. An important application of ITPACK is for use as solution modules in the ELLPACK package of computer routines for solving a class of partial differential equations. We review the objectives of the ITPACK project, summarize the progress made to date and outline plans for future work. A summary is given of work on both software and research that has contributed to the present mathematical software package. The 2C version of ITPACK for scalar computers and a version for use on high performance vector computers are discussed. An overview is given of the developmental work on other software involving more general preconditioners and additional nonsymmetric procedures.

33084 **(CONF-8505131—2) Search of the VAXintosh customizing VMS V4.0 for DCL windows.** Downward, J.G. (KMS Fusion, Inc., Ann Arbor, MI (USA)). 1985. Contract AC08-82DP40152. 14p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011306.

From Spring DECUS symposium; New Orleans, LA, USA (27 May 1985).

This paper will describe methods of implementing such windows for: (1) DCL and MAIL; (2) Command Procedures; and (3) the VMS V4.0 editors EDT, LSE and TPU. While VMS and a number of utilities have the SPAWN command available to the user, the window interface to be described has been found in practice to be simpler to use because: (1) windows are consistently invoked with a single key command; and (2) confusion is minimized because one always knows if one is in a window.

33085 **(DESY—84-118) Unfolding methods in high-energy physics experiments.** Blobel, V. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Dec 1984. 40p. (CONF-8409223—1). NTIS (US Sales Only), PC A03/MF A01. File Number DE85751638.

From CERN school of computing '84; Algua Blava, Spain (9 Sep 1984).

Distributions measured in high-energy physics experiments are often distorted or transformed by limited acceptance and finite resolution of the detectors. The unfolding of measured distributions is an important, but due to inherent instabilities a very difficult problem. Methods for unfolding, applicable for the analysis of high-energy physics experiments, and their properties are discussed. An introduction is given to the method of regularization.

33086 **(DOE/ER/10718—5) Toolpack. Final report, August 1, 1980-July 31, 1984.** Osterweil, L.J.; Fosdick, L.D. (Colorado Univ., Boulder (USA)). May 1985. Contract AC02-80ER10718. 23p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013135.

The Toolpack project has produced a large configuration of tightly integrated tools comprising a numerical software development environment. As its participation in the Toolpack collaborative project, the University of Colorado created some major tool capabilities, devised and implemented Odin - an innovative tool integration system, and served technical coordinator during the early phases of the project. The combination of research, development and definitive evaluation which characterized our participation in the Toolpack project has been a uniquely challenging and stimulating opportunity to advance the state-of-the-art and the state of practice in the area of software tools and environments. Knowledge about tool integration has been significantly advanced through our development of Odin, and the widespread use of effective tools by an important software community will also be significantly advanced by our development of the Toolpack/IST prototype which has now given way to the distributed Toolpack/1 system.

33087 **(DOE/ER/10954—2) Research program in iterative solution and finite element analysis in computational mechanics. Annual progress report, 1983.** Carey, G.F.; Young, D.M. (Texas Univ., Austin (USA)). 1983. Contract AS05-81ER10954. 16p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011900.

The second year of research concerning the theory and use of iterative methods in finite element approximation of boundary-value problems is covered. Significant progress has been made, especially in the development of a new technique, termed the local elliptic projection procedure, for use in adaptive finite element mesh refinement and iterative solution; analysis of errors for domain truncation to evaluate far field boundary conditions on finite domain approximations to a fully infinite domain; analysis of certain nonlinear literative methods for penalty finite element approximation of Navier-Stokes problems; development of a local element-oriented (block) iteration scheme and an algorithm for vector processors; the vectorization of the ITPACK software package; other work on vectorization; and the iterative solution of nonsymmetric linear systems.

33088 **(DOE/ER/13122—T1) Scientific workstation research. Second annual report, August 1984-July 1985.** Foley, J.D. (George Washington Univ., Washington, DC (USA). Dept. of Electrical Engineering and Computer Science). May 1985. Contract AS05-83ER13122. 6p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013385.

During the past year we have continued to develop key concepts needed in graphics programming languages. The overall language structure consists of geometric modeling, viewing, interaction management, and display management subsystems. Within each area, we have been developing descriptions of the semantic capabilities required. Several important themes run through these capabilities. The themes are important because they will form the basis for constructs in the programming language. One of the themes is that of dynamic links. Links maintain dependencies between data variables (which might include graphic/geometric objects). Thus when variable A changes, so too do the other variables which have functional dependencies on A. Another theme is that of coordinate system. It seems natural that a graphics language deal with coordinate systems, and declare an object's coordinate system as one of its attributes. We then use another theme, that of a transformer, to relate one coordinate system to another. Transformers are useful in input (to relate the coordinate system of a mouse or tablet to the world coordinate system), and in viewing (to relate world coordinates to the screen). Another concept used is that of additional dimensions as a means of specifying attributes. The intensity of a point, for example, is just another (non-geometrical) coordinate of the point. By treating attributes in this way, the attribute values can be operated on by transformers: a separate language construct is not needed.

33089 **(DOE/TIC—3386-Suppl.1) Computer codes: a bibliography. Supplement 1.** Thoeming, G.H. (ed.). (USDOE Office of Scientific and Technical Information, Oak Ridge, TN). Jun 1985. 987p. NTIS $36.75/MF A01; GPO Dep. File Number DE85008721.

Included are 3964 citations to literature on computer codes contained in the DOE Energy Data Base for the period March 1981 through January 1985. The citations represent all Energy Data Base subject categories and include reports, journal articles, books, conference papers, and monographs. Corporate, Personal Author, Subject, and Report Number Indexes are provided.

33090 **(IFT-P—01/83) Zeroes of infinite series.** Aguilera-Navarro, V.C.; Aguilera-Navarro, M.C.K. (Instituto de Fisica Teorica, Sao Paulo (Brazil)). 1983. 11p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701116.

A recursive method to obtain a zero of an infinite series is described.

33091 **(IFVE-OEA—83-162) Dialog guide programs for operators of scanning-measuring projectors in the COSDES system. Part 2. Guide program realization.** Ammosov, V.V.; Ivanov, Yu.N.; Ivanova, N.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1983. 19p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701286.

The guide programs realized in the COSDES system adapted to the DEC-10 computer exercising the control of the scanning-measuring projector operator work in the dialog regime are described. Algorithms of the programs, their peculiarities according to requirements of physical experiments are considered. Characteristics of the programs and the results of their use are given. The guide programs are used for data processing in experiments with the Mirabel and BEBC bubble chambers and with the 15-feet Fermilab chamber. The programs are written in the assembler MACRO-1O and FORTRAN languages.

33092 **(JAERI-M—84-033) DDXPLOT: a program to plot the energy angle double-differential cross sections.** Iguchi, Tetsuo; Yamano, Naoki. (Japan Atomic Energy Research Inst., Tokyo). Feb 1984. 39p. (In Japanese). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701123.

A program "DDXPLOT" has been developed to plot the energy-angle double differential cross sections (DDX) calculated from the current evaluated nuclear data library with the experimental data. The calculated DDX data of each reaction type are summed up and smoothed out according to the experimental conditions. Furthermore, the DDX data from various evaluated libraries can be compared with one another, by specifying the identification names in the data pool. This report is the manual of DDXPLOT.

33093 **(JINR—10-83-852) AUTOP program package for spectrometric data on-line processing using small computers.** Churakov, A.K.; Byalko, A.A.; Volkov, N.G.; Ferentsei, J.; Fominykh, M.I.; Tsupko-Sitnikov, V.M. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1983. 15p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701124.

Submitted to the journal Prikladnaya Yadernaya Spektroskopiya.

The AUTOP service prgram package intended for the solution of various problems connected with spectrometric data processing using small computers is described. All programs are written in the FORTRAN-4 and adapted for the SM-3, SM-4 and ES-1010 computers. The AUTOP package comprises the FITDEV subroutine for approximation of experimental data by arbitrary analytical functions, the RETIX program for solution of the Fredholm first kind equation for the problems of distorted data reconstruction, the AUTOP program for on-line spectra processing realizing automatic peak identification, multiplet separation and peak parameter determination by assymetric gaussion fit, the PUCH program for separate spectrum part processing, the MESS program for processing the nuclear gamma resonance (NGR) spectra using the index algorithm for the approximating function representation, the SPLINE program for analytical curve plotting by the spline-MNK method, the CMGR program for output of the spectrum curve, the NUGRAF program for plotting the curve of spectrum part decompositiogn, the MESGRF program for plotting NGR spectra decomposition curves. The AUTOP main set can be used with the RAFOS or RT 11 V03 (02) operational systems for the SM-3 computer with immediate-access memory volume not less than 32 K. The module principle on which the AUTOP package is based permits to use it widely in various fields dealing with processing the data both spectrometric and not related to spectrometry (analysis of volt-ampere characteristics, apparatus noises, optimal experiment planning).

33094 **(KFK—3833) MODEASY - a program-system for modification and management of stored functions of one independent variable.** Heger, R.; Kuefner, K. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Dec 1984. 148p. (In German). NTIS (US Sales Only), PC A07/MF A01. File Number DE85751654.

FORTRAN-77.

The FORTRAN-77 program MODEASY is used for management and modification of datasets that contain (normally many) functions of one independent variable. Those functions are stored as 3 records each, consisting of an identification part, abscissa and ordinates; e.g. as values at discrete points. As options are available so far: list, copy, delete, create, filtering, integration, Fourier-analysis, modification and renaming of curves as well as calculation of sum, deviation, linear combination and tabulation of several curves. Beside this there are some utility and special options available. Because of the strictly modular structure of the program it should be easy to add new options or to support another storage format of the curves.

33095 **(KFK—3855) MUSTAFA and MUSTAMO, computer programs for analysis of fault trees with multistate-components.** Wickenhaeuser, A. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Feb 1985. 74p. (In German). NTIS (US Sales Only), PC A04/MF A01. File Number DE85751645.

The two codes MUSTAFA and MUSTAMO are result and application of the methods for fault tree analysis newly developed by Caldarola during the last years. The two programmes overcome the basic difficulties of the analytical methods: the limited flexibility and difficulties with the handling of large interconnected systems. Basis of the new approach is the Boolean Algebra with restricted variables which allows for to handle components or supercomponents with more than two states. The programme MUSTAFA provides the following capabilities: handling of components with more than two states, modelling of statistical dependencies in various ways, identification of an incoherent Boolean function and its reduction to a smaller basis, extension of a Boolean function for exact calculation of probabilities and calculation of transfer rates between different states of the system. In addition to these capabilities MUSTAMO is able to subdivide large and strongly interconnected fault trees into smaller subsystems and either by horizontal subdivision into modules and supercomponents or by vertical subdivision via the splitting procedure. The report consists of the following parts: explanation of the methods used, description of the application using different options within the code structure and sample cases.

33096 **(LA-UR—84-3370) Information-theoretic model of the programming process.** Coulter, N.S. (Los Alamos National Lab., NM (USA); Florida Atlantic Univ., Boca Raton (USA)). 1985. Contract W-7405-ENG-36. 22p. (CONF-850709—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85002419.

From National computer conference; Chicago, IL, USA (22 Jul 1985).

Aspects of computer programming activities have been modeled by numerous researchers. The model presented here is based on an information-theoretic description that provides a unified formalization of the programming process from specification through implementation. The concept of an algorithm's problem space is developed, and the complexity of an algorithm is defined in terms of its associated variables and their values. An algorithm's complexity is derived from the declaration section of the resulting program. Because a program's declarations are derivable before the program body is implemented, a program's complexity can be estimated before it is completed. This model provides insight into the comparative complexities of problem spaces and suggests ways of subdividing those problem spaces and their associated programs.

33097 **(LA-UR—85-828) New probabilistic modeling and simulation methods for complex time-dependent systems.** Bartholomew, R.J. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 13p. (CONF-850723—2). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85009575.

From 7. international system safety conference; San Jose, CA, USA (25 Jul 1985).

This paper is a tutorial that presents a new method of modeling the probabilistic description of failure mechanisms in complex, time-dependent systems. The method of modeling employs a state vector differential equation representation of cumulative failure probabilities derived from Markov models associated with certain generic fault trees, and the method automatically includes common cause/common mode statistical dependencies, as well as time-related dependencies not considered in the literature previously. Simulations of these models employ a population dynamics representation of a probability space involving probability particle transitions among the Markov disjoint states. The particle transitions are governed by a random, Monte Carlo selection process.

33098 **(LA-UR—85-1817) Using an LSI-11/23 and RT-11 to digitize analog tapes.** Stewart, J.N. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 7p. (CONF-8505131—4). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012736.

From Spring DECUS symposium; New Orleans, LA, USA (27 May 1985).

The author describes in this paper the design and implementation of a system on an LSI-11/23 under RT-11 that digitizes 14-channel analog tapes at given intervals and writes the digitized data to a magnetic tape. The analog tapes contain 13 channels of data and one channel of IRIG-B time code. A given interval is selected by entering a time and an interval. The IRIG-B time code is read from the analog tapes and used to start the digitizing. A programmable clock board is used to control the digitizer and to count the interval length. In order to achieve the through-put rates needed, the author wrote the code in MACRO and addressed the magnetic tape controller directly instead of using programmed requests.

33099 **(PNL-SA—13023) Managing data analysis through save-states.** Cowley, P.J.; Whiting, M.A. (Pacific Northwest Labs., Richland, WA (USA)). Apr 1985. Contract AC06-76RL01830. 8p. (CONF-8503116—2). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012456.

From 17. symposium on the interface of computer science and statistics; Lexington, KY, USA (17 Mar 1985).

Data analysis management is a methodology intended to increase the productivity of the data analyst. A primary entity for data analysis management is the "save-state", a collection of metadata and data that captures a state of the analysis. The analyst may create a save-state to designate a milestone of the analysis. The save-state may be used later to return to that milestone by restoring the conditions of the analysis that existed at the time the save-state was created. Scientists at Pacific Northwest Laboratory (PNL) have developed a prototype data analysis management system. In that system, a save-state includes pointers to the data sets and command procedures active at the time the save-state was created, active plot descriptions and other graphics parameters, and comments supplied by the analyst. Associated with each save-state is a record of the sequence of commands or operations used to accomplish the transition from the previous (parent) save-state. Metadata also describes the overall relationships between the save-states that have been created during the analysis.

33100 **(SAND—85-0391C) Simulation of lattice damage due to dynamic loading.** Taylor, P.A.; Dodson, B.W. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 10p. (CONF-850736—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85008468.

From American Physical Society topical conference on shock waves in condensed matter; Spokane, WA, USA (22 Jul 1985).

By means of a dynamic simulation technique developed by the authors and based upon the Monte Carlo method, we investigate the response of two-dimensional Lennard-Jones lattice systems to dynamic uniaxial strain paths that are either fast or slow with respect to a lattice equilibration time. The simulation of lattice response to various compression-release cycles indicates a dependence of the degree of sustained lattice damage (i.e., dislocations and defects) on the rate and maximum amplitude of applied strain. Specifically, greater lattice damage is predicted whenever the lattice is subjected to a fast-loading process and/or higher maximum strain amplitude as compared to that induced by a slow-loading process and/or lower maximum strain amplitude.

33101 **(SAND—85-0725C) Control of step size and order in extrapolation codes.** Shampine, L.F. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 29p. (CONF-850752—1). NTIS, PC A03/MF A01; GPO Dep. File Number DE85010122.

From South African symposium on numerical math; Durban, South Africa (8 Jul 1985).

Extrapolation of the semi-implicit midpoint rule is an effective way to solve stiff initial value problems for a system of ordinary differential equations. The theory of the control of step size and order is advanced by investigating questions not taken up before, providing additional justification for some algorithms, and providing support for procedures not properly justified by the information theory approach of Deuflhard. An experimental code SIMP implementing the algorithms proposed is shown to be as good as, and in some respects much better than, the research code METAN1 of Bader and Deuflhard. 18 refs.

33102 **(SAND—85-0856) Experiments and improvements of the ordinary differential equation solvers DEPAC on the CRAY computer.** Watts, H.A. (Sandia National Labs., Albuquerque, NM (USA)). May 1985. Contract AC04-76DP00789. 32p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85013260.

We have looked at timing results when solving large systems of differential equations using DEPAC on the CRAY computer. By reprogramming some critical (previously nonvectorized) loops, using loop unrolling where appropriate, and using the CRAY $SCILIB routines, significant speedup factors have been achieved. For example, when overhead is dominant (i.e., the derivative evaluation cost per component is minimal), we have observed cost reductions by factors of 2 to 7 when compared to the unmodified codes. We have also incorporated three additional user options which enable faster execution in appropriate circumstances. The modified DEPAC will replace the earlier package as part of the SLATEC library for use on the CRAY. The computational results produced are identical to those obtained by the earlier codes.

33103 **(SAND—85-1110C) Graph-theoretical exorcism.** Simmons, G.J. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 11p. (CONF-850283—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011916.

From 16. Southeastern international conference on combinatorics, graph theory, and computing; Boca Raton, FL, USA (11 Feb 1985).

Given a graph G and an ordering phi of the vertices, V(G), we define a parsimonious proper coloring (PPC) of V(G) under phi to be a proper coloring of V(G) in the order phi, where a new color is introduced only when a vertex cannot be properly colored in its order with any of the colors already used.

33104 (SOL—85-5) Practical approach to Karmarkar's algorithm. Lustig, I.J. (Stanford Univ., CA (USA). Systems Optimization Lab.). Jun 1985. Contract AT03-76ER72018. 22p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85013188.

A practical approach to implementing Karmarkar's algorithm is discussed. A variant of the algorithm is proposed which still has polynomial complexity and which eliminates the need for Karmarkar's canonical form. This method allows upper and lower bounds to be used and does not require knowledge of the objective value. Some heuristics are given which alleviate certain computational difficulties that arise when a practical implementation of the algorithm is attemped. A FORTRAN program is described that allows one to study its convergence properties.

33105 (UCID—20422) Flat is not necessarily good. Balaban, D.J.; Nelson, D.O. (Lawrence Livermore National Lab., CA (USA)). 17 Apr 1985. Contract W-7405-ENG-48. 8p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012819.

The disciplines of software engineering and expert system building seem very different from each other. The software engineer describes a system in terms of its interactions with a simplified version of the world around it. The expert system builder, on the other hand, describes a system in terms of knowledge acquired from an available expert and strategies for exploiting that knowledge. In fact, this perceived difference is due in large part to a difference in the complexity of the world being modeled. In this paper we explore the relationship between these two disciplines and describe means by which new AI techniques can be directly used to extend software engineering methodologies without also importing deficiencies inherent in rule-based expert systems.

33106 (UCRL—92480) Some ideas for decomposing the domain of elliptic partial differential equations in the Schwarz process. Rodrigue, G. (Lawrence Livermore National Lab., CA (USA)). Mar 1985. Contract W-7405-ENG-48. 12p. (CONF-8503129—2). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011844.

From Symposium on algorithms, architectures and the future of scientific computation; Austin, TX, USA (18 Mar 1985).

Simulations have shown that one of the major breakdowns in the efficiency of a multiprocessing computing system is overcommunication between the computer modules. Experiments on the CRAY XMP/2 seem to corroborate these predictions. Consequently, in designing numerical methods for multiprocessors, algorithms are sought that can be partitioned so that communication between the algorithmic tasks is minimized. In scientific calculations, this communication amounts to the passing of numerical data that mathematically couple the individual scientific processes. Thus, the goal in multiprocessing scientific calculations is to define individual scientific processes that are weakly coupled to one another. Many partial differential equations have an inherent potential for multiprocessing in the domain of dependence of the independent variables. To illustrate, we consider the numerical solution of the partial differential equation: partial u/partial t = F(x, u, t, D/sub x/u, D/sub x/^{2}u, ...).

33107 (UCRL—92624) Parallel processing on the Livermore VAX 11/780-4 parallel processor system with compatibility to Cray Research, Inc. (CRI) multitasking. Version 1. Werner, N.E.; Van Matre, S.W. (Lawrence Livermore National Lab., CA (USA)). May 1985. Contract W-7405-ENG-48. 48p. (CONF-8505131—3). NTIS, PC A03/MF A01; GPO Dep. File Number DE85011856.

From Spring DECUS symposium; New Orleans, LA, USA (27 May 1985).

This manual describes the CRI Subroutine Library and Utility Package. The CRI library provides Cray multitasking functionality on the four-processor shared memory VAX 11/780-4. Additional functionality has been added for more flexibility. A discussion of the library, utilities, error messages, and example programs is provided.

33108 (UIUCDCS-R—85-1205) Implementing linear multistep formulas for solving DAES. Gupta, G.K.; Gear, C.W.; Leimkuhler, B. (Illinois Univ., Urbana (USA). Dept. of Computer Science). Apr 1985. Contract AC02-76ER02383. 36p. (UILU-ENG—85-1709; COO—2383-0107). NTIS, PC A03/MF A01; GPO Dep. File Number DE85012400.

The organization of an automatic code for differential-algebraic equations is discussed. The proposed code can handle a large class of problems of index no greater than two. 9 refs.

33109 Numerical generation of boundary-fitted curvilinear coordinate systems for arbitrarily curved surfaces. Takagi, T.; Miki, K.; Chen, B.C.J.; Sha, W.T. (Energy Research Laboratory, Hitachi, Ltd., 1168 Moriyama-cho, Hitachi-shi, Ibaraki-ken, 316 Japan). *Journal of Computational Physics;* **58**: No. 1, 67-79(Mar 1985).

A new method is presented for numerically generating boundary-fitted coordinate systems for arbitrarily curved surfaces. The three-dimensional surface has been expressed by functions of two parameters using the geometrical modeling techniques in computer graphics. This leads to new quasi-one- and two-dimensional elliptic partial differential equations for coordinate transformation. Since the equations involve the derivatives of the surface expressions, the grids geneated by the equations distribute on the surface depending on its slope and curvature. A computer program GRID-CS based on the method was developed and applied to a surface of the second order, a torus and a surface of a primary containment vessel for a nuclear reactor. These applications confirm that GRID-CS is a convenient and efficient tool for grid generation on arbitrarily curved surfaces.

Research is summarized in these areas: semantic modeling and language design; complex data types; database mapping and integration; physical design; and parallel algorithms and database machines. 158 refs.

33111 (DOE/MI/01015—T1) User's guide for the Office of Minority Economic Impact National Information Clearinghouse System. (Ronson Management Corp., Alexandria, VA (USA)). 15 Jun 1982. Contract AC01-81MI01015. 71p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85012620.

The Office of Minority Economic Impact National Information Clearinghouse System (OMEI/NICS) is based on three other comprehensive and well established systems. They are the Technical Information Center's Descriptive Cataloging On-Line (DECOL), a bibliographic System in operation at Oak Ridge National Laboratory called RECON, and a Document Distribution System (DDS-2) operated at the DOE's Germantown Facility. All of these systems have extensive documentation. This document is designed to be an adjunct to that material. It provides an overview of each capability, annotates key sections of the systems documentation and concludes with a summary containing an outline of the steps necessary to accomplish the mainline functions of the OMEI application.

33112 (FRNC-TH—1551) Design and creation of a direct access nuclear data file. Charpentier, P. (Paris-11 Univ., 91 - Orsay (France)). Jun 1981. 198p. (In French). NTIS (US Sales Only), PC A09/MF A01. File Number DE85751298.

General considerations on the structure of instructions and files are reviewed. Design, organization and mode of use of the different files: instruction file, index files, inverted files, automatic analysis and inquiry programs are examined.

CORPORATE AUTHOR INDEX

In the Corporate Author Index, report literature is indexed using the name of the organization or institution responsible for issuing the report. Headings are provided for all report literature and for published literature for which a corporate approach is especially desirable, e.g., symposium and conference proceedings.

Each entry under a corporate heading gives the document title and the volume and abstract numbers. The document type, e.g., R for Report; country of publication, e.g., US; and language of the document, e.g., In German, are given in parentheses at the end of the entry. If no language statement appears, the language is English. Tables of document types and country of publication codes appear after the indexes.

DOE Energy Data Base: Corporate Author Entries (DOE/TIC-4585) is used in the standardization of corporate entries. DOE/TIC-4585 is available for purchase from the National Technical Information Service (NTIS), U. S. Department of Commerce, Springfield, Virginia 22161.

A

Acurex Corp., Mountain View, CA (USA)
  Design and construction of the SMUDPV1 1-MW photovoltaic power plant. Final report I, 10:30332 (R;US)
  SMUDPV1 quarterly performance report II, January-March 1985, 10:30331 (R;US)
Acurex Corp., Mountain View, CA (USA). Energy and Environmental Div.
  Preliminary assessment of costs and credits for hazardous waste co-firing in industrial boilers. Final report, 1 July 83-15 oct 83, 10:31364 (R;US)
Advanced Research and Applications Corp., Sunnyvale, CA (USA)
  Novette diagnostic support. Final report, 10:33043 (R;US)
Aeronautical Research Associates of Princeton, Inc., NJ (USA)
  Comparison of the 1981 INEL dispersion data with results from a number of different models, 10:32114 (R;US)
Aerospace Corp., El Segundo, CA (USA). Aerophysics Lab.
  Pulsed D_2-F_2 chain-laser damage to coated window and mirror components, 10:31763 (R;US)
Aerospace Corp., El Segundo, CA (USA). Space Sciences Lab.
  Earth's radiation belts, 10:32465 (R;US)
Air Force Geophysics Lab., Hanscom AFB, MA (USA)
  High-altitude nuclear-detonation optical infrared effects, 10:32098 (R;US)
  Piggyback satellite packages, 10:32099 (R;US)
Air Pollution Technology, Inc., San Diego, CA (USA)
  Flue-gas conditioning. Final report, March 1979-March 1982, 10:30663 (R;US)
Alabama Univ., Huntsville (USA)
  Plasma and magnetospheric research, 10:32459 (R;US)
Alaska Univ., Fairbanks (USA). Geophysical Inst.
  Current interruption by density depression, 10:32890 (R;US)
Allied Corp., Kansas City, MO (USA). Bendix Kansas City Div.
  Thermally induced failures of thick-film glaze resistors, 10:31803 (R;US)
  X-ray fluorescence analysis of 304L stainless steel. Final report, 10:31785 (R;US)
Alzeta Corp., Mountain View, CA (USA)
  Advanced furnace concepts - commercial unit heater. Annual report, October 1983-September 1984, 10:31832 (R;US)
American Cyanamid Co., Stamford, CT. Chemical Research Div.
  Development of significantly improved catalysts for coal liquefaction and upgrading of coal extracts. Final report, September 28, 1981-February 28, 1985, 10:29624 (R;US)
American Nuclear Society. Florida Section
  Light water reactor fuel performance: proceedings. Volume 1, 10:30673 (R;US)
  Light water reactor fuel performance: proceedings. Volume 2, 10:30674 (R;US)
Ames Lab., IA (USA)
  Continuum flow sampling mass spectrometer for elemental analysis with an inductively coupled plasma ion source, 10:32052 (R;US)
  Formation of benzene by the pyrolysis of 4-vinylcyclohexene regiospecific formation of anthracenes in the pyrolysis of dibenzobuerones and related systems, 10:31674 (R;US)
  Mechanistic study of the hydrodesulfurization of methanethiol over tungsten disulfide; a survey of rare earth sulfides for hydrodesulfurization activity, 10:31673 (R;US)
  Preparation of silicon nitride by pyrolysis of iminopolysilanes, 10:31531 (R;US)
Amoco Production Co., Chicago, IL (USA)
  Comprehensive fracture diagnostics experiment. Part II. Comparison of seven fracture azimuth measurements, 10:29811 (R;US)
Amoco Research Center, Naperville, IL (USA)
  Advanced coal liquefaction catalyst development. Quarterly progress report No. 9, October 1-December 31, 1983, 10:29623 (R;US)
Angel Economic Reports, Cupertino, CA (USA)
  Customer response to load management: a survey and analysis of utility studies. Final report, 10:31168 (R;US)
AN SSSR, Moscow. Inst. Vysokikh Temperatur
  Analytical investigations of the effects of cathode nonuniformities on magnetohydrodynamic (MGD) generator characteristics, 10:31185 (TA;US)
  Effects of cathode slag polarization on magnetohydrodynamic generator performance, 10:31182 (TA;US)
  Magnetohydrodynamic generator performance comparisons between coal and oil plus ash firing, 10:31183 (TA;US)
  Results from comparative analysis of different magnetohydrodynamic generator and power train designs for early commercial power plant applications, 10:30657 (TA;US)
  The effect of current control circuits on magnetohydrodynamic generator performance, 10:31184 (TA;US)
AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki
  Beta-functions of the nonlinear σ-models on some noncompact symmetric spaces, 10:32861 (R;SU;In Russian)
  Dependence of three-nucleon low-energetic parameters on the number of considering in p-matrix egien states of six-quark bag, 10:32670 (R;SU;In Russian)
  Description of the equilibrium states of the thermodynamic systems, 10:32860 (R;SU;In Russian)
  Dynamic systems in statistical physics, 10:32862 (R;SU;In Russian)
  Effective Lagrangian in two-dimensional electrodynamics with anomalous moment, 10:32647 (R;SU;In Russian)
AN Ukrainskoj SSR, Kiev. Inst. Yadernykh Issledovanij
  Modernization of the U-240 isochronous cyclotron in 1982, 10:31860 (R;SU;In Russian)
  Nuclear and physical researches on the isochronous cyclotron U-240 during 1982, 10:32666 (R;SU;In Russian)
Applied Geomechanics, Inc., Santa Cruz, CA (USA)
  Monitoring of surface deformation and microseismicity applied to radioactive waste disposal through hydraulic fracturing at Oak Ridge National Laboratory, 10:29913 (R;US)
Applied Management Sciences, Inc., Silver Spring, MD (USA)
  Sample design for load research: current practice and methods, 10:31169 (R;US)

Applied Psychological Services, Inc., Wayne, PA (USA)
Maintenance Personnel Performance Simulation (MAPPS) model: description of model content, structure, and sensitivity testing. Volume 2, 10:30767 (R;US)
Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF), Bonn (Germany, F.R.)
Trace element analytical chemistry in medicine and biology, 10:32350 (R;DE)
AREA, Inc., Albuquerque, NM (USA)
Energy conservation code assessment. Volume 1. Final report, 10:31272 (R;US)
Argonne National Lab., Idaho Falls, ID (USA)
Application of microprocessor based controller in the Breeder Reactor Program, 10:30823 (R;US)
Distribution of fission products in an LMFBR: summary, 10:30857 (R;US)
Ultra-reliable computer systems: an integrated approach for application in reactor safety systems, 10:30858 (R;US)
Argonne National Lab., IL (USA)
Acceptability of local boiling during shutdown heat removal, 10:30848 (R;US)
Accommodation of unprotected accidents by inherent safety design features in metallic and oxide-fueled LMFBRs, 10:30849 (R;US)
Analysis of transient fission gas release and swelling in oxide fuel, 10:30819 (R;US)
Applying multidisciplinary policy analysis to factors affecting coal use, 10:31151 (R;US)
Beam intensity increases at the intense pulsed neutron source accelerator, 10:31834 (R;US)
Beam-cavity interaction measurements in a DAW structure, 10:31862 (R;US)
Characterization of nuclear reactor containment penetrations. Preliminary report, 10:30813 (R;US)
Comparison between theoretical predictions and tracking, 10:31891 (R;US)
Construction and initial operation of a seasonal solar cooling system, 10:30358 (R;US)
Degraded core study using the multidimensional COMMIX code, 10:30856 (R;US)
Development of a supported liquid membrane as a nickel-zinc secondary battery separator, 10:31053 (R;US)
Direct and indirect costs arising from implementation of new engines, 10:31125 (R;US)
Downstream behavior of volatile fission product species, 10:30847 (R;US)
Estimating risks of lead-induced hemoglobin decrements under conditions of uncertainty: methodology, pilot judgments, and illustrative calculations, 10:32346 (R;US)
Evaluation of a hanging core support concept for LMR application, 10:30734 (R;US)
Fast-neutron interaction with niobium, 10:32717 (R;US)
Fermi surface study of CeSb in the ferromagnetic and antiferromagnetic phases , 10:31438 (R;US)
Geology and petroleum resources of basins in western China, 10:29744 (R;US)
Light-water-reactor safety fuel systems research programs. Quarterly progress report, July-September 1984. Volume 3, 10:31015 (R;US)
Long-term embrittlement of cast duplex stainless steels in LWR systems. Annual report, October 1983-September 1984, 10:30689 (R;US)
Magnitude and range of the RKKY interaction in $SmRh_4B_4$, 10:31525 (R;US)
Microdosimetric spectra measurements of JANUS neutrons, 10:32819 (R;US)
Monitoring system for a liquid-cooled nuclear fission reactor, 10:30720 (P;US)
Performance of the H^- ion source for the intense pulsed neutron source, 10:31941 (R;US)
Proposed fuel cycle for the Integral Fast Reactor, 10:30736 (R;US)
Quantitative analysis of the effect of complex internals on LMFBR containment during energetic accidents, 10:30852 (R;US)
Role of fuel bubble phenomenology in assessment of LMFBR source term, 10:30851 (R;US)
SASSYS-1 computer code verification with EBR-II test data, 10:30836 (R;US)
Scoping studies of vapor behavior during a severe accident in a metal-fueled reactor, 10:30850 (R;US)
Steam generator model for real-time analysis, 10:30735 (R;US)
Technical assessment of thermal-hydraulics for high heat flux fusion components, 10:33030 (R;US)
Vacuum system for the Argonne 6 GeV synchrotron light source, 10:32005 (R;US)
Arizona Public Service Co., Phoenix (USA)
Airport solar photovoltaic concentrator, Phase III. Project status report No. ASPCP III-8, February 1, 1984-March 31, 1984, 10:30333 (R;US)
Airport solar photovoltaic concentrator, Phase III. Project status report No. ASPCP III-10, June 1, 1984-September 30, 1984, 10:30335 (R;US)
Airport solar photovoltaic concentrator, Phase III. Project status report No. ASPCP III-9, April 1, 1984-May 31, 1984, 10:30334 (R;US)
Arizona State Univ., Tempe (USA). Coll. of Architecture
Evaporative cooling workshop. Final technical report, 10:31264 (R;US)
Arizona State Univ., Tempe (USA). Coll. of Engineering
Biological treatment of tar sands wastewater. Final report, 10:29847 (R;US)
Arizona State Univ., Tempe (USA). Dept. of Mechanical and Aerospace Engineering
Size and velocity distributions of particles and droplets in spray-combustion systems. Final report, 1 March 1980-15 August 1984, 10:31823 (R;US)
Arizona Univ., Tucson (USA). Dept. of Biochemistry
Mechanisms of photochemical energy conversion by chlorophyll. Technical progress report, March 1, 1983-March 1, 1985, 10:30299 (R;US)
Arizona Univ., Tucson (USA). Dept. of Nuclear and Energy Engineering
Low-level nuclear waste shallow land burial trench isolation. Final report, October 1981-September 1984, 10:29955 (R;US)
Arizona Univ., Tucson (USA). Dept. of Physics
Solar variability observed through changes in solar figure and mean diameter, 10:32419 (R;US)
Arkansas State Univ., State University (USA). Dept. of Chemistry
Alkali atom impact reactions on coal combustion substrates. Quarterly report Nos. 6 and 7, November 15, 1984-June 15, 1985 and March 15, 1985-June 15, 1985, 10:29723 (R;US)
Arkansas Univ., Fayetteville (USA)
Assessment of fluidized-bed-combustion solid wastes for land disposal. Volume 1. Final report. Report for June 1980-June 1984, 10:29676 (R;US)
Army Armament Research and Development Command, Aberdeen Proving Ground, MD (USA). Ballistics Research Lab.
Design of a Mobile Combustion Diagnostic Fixture (MCDF). Final report, 10:31827 (R;US)
Army Construction Engineering Research Lab., Champaign, IL (USA)
Automated building design review using BLAST (Building Loads Analysis and System Thermodynamics). Final report, 10:31192 (R;US)
Heat-recovery incineration: a summary of operational experience. Final report, 10:31372 (R;US)
New control design principles based on measured performance and energy analysis of HVAC (heating, ventilating, and air-conditioning) systems. Interim report, 10:31193 (R;US)
Army Engineer District, Savannah, GA (USA)
Cooper River rediversion project, St. Stephen Powerplant, St. Stephen, Carolina: engineering considerations and instructions for field personnel, 10:30104 (R;US)
Army Missile Command, Redstone Arsenal, AL (USA). Directed Energy Directorate
Near field/far field (nf/ff) energy loss in electric-discharge lasers (EDL's): a mode-medium interaction. Technical report, 10:31755 (R;US)
Army War Coll., Carlisle Barracks, PA (USA)
Nuclear winter: environmental and human consequences of nuclear war - a selected bibliography, 10:31133 (R;US)
Associated Mining Consultants Ltd., Calgary, Alberta (Canada)
Picture Butte coal project: a technical assessment of Picture Butte, 1983. [Final report], 10:29691 (R;CA)
ASTM, Philadelphia, PA (USA)
[Solar industry standards]. Final technical report, 10:30292 (R;US)

Atomic Energy Control Board, Ottawa, Ontario (Canada)
Atomic Energy Control Board. Modus operandi, 10:30759 (R;CA)
Comparison of deterministic and stochastic techniques for estimation of design basis floods for nuclear power plants, 10:30950 (R;CA)
Consequences of pressure tube rupture on in-core components. Phase 1 - technology review, 10:30951 (R;CA)
Exporting the Canadian licensing program, 10:30727 (R;CA)
Field measurements of mixed exposure of operators to radioactive aerosol, gas and quartz in confinement of mining equipment cabs during open-pit mining of high-grade uranium ores, 10:32310 (R;CA)
Qualitative evaluation of long-term processes governing the behaviour of uranium mill tailings placed in deep lakes, 10:29933 (R;CA)
Qualitative evaluation of long-term processes governing the behaviour of uranium mill tailings placed in deep lakes. Annexes, 10:29934 (R;CA)
Risk estimates for the health effects of alpha radiation, 10:32309 (R;CA)

Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.
Analysis of flow-induced vibration of heat exchanger and steam generator tube bundles using the AECL computer code PIPEAU-2, 10:30810 (R;CA)
Effects of ionizing radiation and review of the Young-Woollard document, 10:32294 (R;CA)
LEEM - a lake energy and evaporation model user's manual, 10:32181 (R;CA)
Migration of radionuclides in unconsolidated materials. Equilibrium transport models, 10:30007 (R;CA)
Numerical computation of phase distribution in two fluid flow using the two-dimensional TOFFEA code, 10:31772 (R;CA)
Progress report: Health Sciences Division, 1982 January 1 to March 31, 10:32010 (R;CA)
Progress report: Health Sciences Division, 1983 January 1-June 30, 10:32012 (R;CA)
Progress report: Health Sciences Division, 1983 July 1-December 31, 10:32817 (R;CA)
Progress report: Physics Division, 1982 April 1-June 30, 10:32661 (R;CA)
Progress report: Physics Division, 1982 January 1 to March 1, 10:33075 (R;CA)
Progress report: Health Sciences Division, 1982 April 1-June 30, 10:32011 (R;CA)
Rearing of fish and selected freshwater organisms in heated effluent. A Canadian perspective, 10:31349 (R;CA)
Slowpoke: the first decade and beyond, 10:30834 (R;CA)
Updated follow-up of long-term Chalk River employees, 10:32295 (R;CA)

Atomic Energy of Canada Ltd., Ottawa, Ontario
1982-1983 annual report [Atomic Energy of Canada Ltd.], 10:31124 (R;CA)

Chemical durability of alkali aluminosilicate glasses, 10:31556 (R;CA)

Atomic Energy of Canada Ltd., Sheridan Park, Ontario. CANDU Operations
Future trends in heavy water production, 10:30046 (R;CA)

Atominstitut der Oesterreichischen Universitaeten, Vienna
Measuring the dimension of space-time, 10:32646 (R;AT)

Auburn Univ., AL (USA). Coal Conversion Lab.
Solvent tailoring in coal liquefaction based on critical properties of physical solvating agents and hydrogen donors. Progress report, August 1980-January 1981, 10:29621 (R;US)

Australian Coal Industry Research Labs. Ltd., North Ryde
Mine plan drafting, 10:29692 (R;AU)

B

Babcock and Wilcox Canada Ltd., Cambridge, Ontario
Start-up support for New Brunswick Electric's Point Lepreau nuclear steam generators, 10:30724 (R;CA)

Baham Corp., Columbia, MD (USA)
Initial assessment of coal-fired ship operations. Final report, 10:29718 (R;US)

Bailey Controls Co., King of Prussia, PA (USA)
Application of microprocessor based controller in the Breeder Reactor Program, 10:30823 (R;US)

Barry (Theodore) and Associates, Los Angeles, CA (USA)
Power plant performance in Massachusetts: analysis and recommendations, 10:31162 (R;US)

Battelle Columbus Labs., OH (USA)
Effectiveness of cathodic protection. Annual report, January-December 1981, 10:29812 (R;US)
Long-term performance of materials used for high-level waste packaging. Third quarterly report, Year Three, October-December 1984. Vol. 3, 10:31471 (R;US)
Management of severe accidents. Extending plant operating procedures into the severe accident regime. Vol. 2, 10:31024 (R;US)
Management of severe accidents. Perspectives on managing severe accidents in commercial nuclear power plants. Vol. 1, 10:31023 (R;US)
TRAP-MELT2 user's manual, 10:31026 (R;US)

Battelle-Institut e.V., Frankfurt am Main (Germany, F.R.)
Feasibility of dismantling the biological shield by the blast-hole technique. Final report, 10:31038 (TG;US)

Beak Consultants Ltd., Toronto, Ontario (Canada)
Qualitative evaluation of long-term processes governing the behaviour of uranium mill tailings placed in deep lakes, 10:29933 (R;CA)

Bechtel Group, Inc., San Francisco, CA (USA)
Helium-cooled molten-salt fusion breeder, 10:33040 (R;US)
Updated cost estimate and benefit analysis of customer-owned battery energy storage, 10:31103 (R;US)

Bechtel National, Inc., Oak Ridge, TN (USA). Advanced Technology Div.
Phase II remedial action at the former Middlesex Sampling Plant site and associated properties. Final report. Volume 1, 10:30024 (R;US)
Phase II remedial action at the former Middlesex Sampling Plant and associated properties. Final report. Volume 3 , 10:30025 (R;US)

Bechtel National, Inc., San Francisco, CA (USA)
Socioeconomic Data Base Report for the Paradox Basin, Utah. Letters and verification forms for personal communication data, 10:29959 (R;US)

Bechtel Petroleum, Inc., Houston, TX (USA)
Design review for Strategic Petroleum Reserve Office: Big Hill, Texas; New Orleans, Louisiana. Appendix, 10:29799 (R;US)
Design review for Strategic Petroleum Reserve office, Big Hill, Texas, New Orleans, Louisiana, 10:29800 (R;US)

Bell Bros. Research Corp., Gardena, CA (USA)
UCB cosmic ray experiment. Final report, 10:32438 (R;US)

Berg (David L.), Miller Place, NY (USA)
Building heat conservation and the feasibility of solar hot water heating in Long Island shellfish hatcheries, 10:31355 (R;US)

Bettis Atomic Power Lab., West Mifflin, PA (USA)
Automatic capability to store and retrieve component data and to calculate structural integrity of these components, 10:30815 (R;US)

Bhabha Atomic Research Centre, Bombay (India)
Synthesis of tetrabutyl tin and its performance characteristics in liquid scintillation counting for radioimmunoassay, 10:31591 (R;IN)

Bhabha Atomic Research Centre, Bombay (India). Chemical Engineering Div.
Synthesis of 2,2'-p-phenylene-bis-5-p-alkylphenyl oxazoles, 10:31668 (R;IN)

Bhabha Atomic Research Centre, Bombay (India). Experimental Reactor Physics Section
Measurement of fast neutron flux profile across the inner face of the MAPP-1 end-shield during reactor commissioning, 10:30835 (R;IN)

Bhabha Atomic Research Centre, Bombay (India). Radiochemistry Div.
Radiochemistry Division annual progress report for 1982, 10:29891 (R;IN)

Bielefeld Univ. (Germany, F.R.). Fakultaet fuer Mathematik
Perturbation of Schroedinger Hamiltonians by measures - self-adjointness and lower semiboundedness, 10:32858 (R;DE)

Bioconcern, Inc., Chicago, IL (USA)
- Effects of high-voltage transmission lines on honeybees, 10:32373 (R;US)

Blind Canyon Aquaranch, Hagerman, ID (USA)
- [Wind turbine]. Final technical report, 10:30622 (R;US)

Boeing Aerospace Co., Seattle, WA (USA)
- Goodnoe Hills Mod-2 Cluster Test Program. Volume 1. Energy production performance, availability, and reliability. Final report, 10:30625 (R;US)
- Goodnoe Hills Mod-2 cluster test program. Volume 2. Structural and mechanical loads tests and analyses. Final report, 10:30626 (R;US)

Bonneville Power Administration, Portland, OR (USA)
- Draft supplement to the environmental statement fiscal year 1975 proposed program. Facility location evaluation for Sappho service study area 75-13, 10:32202 (R;US)
- Draft supplement to the environmental statement fiscal year 1975 proposed program. Facility location evaluation for Ashe-Hanford 500-kV transmission line study area 74-3, 10:32203 (R;US)
- Draft supplement to the environmental statement fiscal year 1975 proposed program. Facility location supplement for Maple Valley 500-kV reinforcement study area 75-14, 10:32205 (R;US)
- Draft supplement to the environmental statement fiscal year 1975 proposed program. Facility location evaluation for San Juan Island service study area 74-7, 10:32204 (R;US)
- Draft supplement to the environmental statement fiscal year 1977 proposed program. Facility location evaluation for Hot Springs-Bell 500-kV line study area 76-6, 10:32207 (R;US)
- Draft supplement to the environmental statement fiscal year 1976 proposed program. Facility location evaluation for Hangman Creek Area service study area 76-8, 10:32206 (R;US)
- Final environmental statement: proposed fiscal year 1975 program, Bonneville Power Administration, 10:32208 (R;US)

Bonn Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet
- Inclusive and exclusive cross sections for the ^{3}He breakup on ^{197}Au. A test case for the DWBA approach in the post-formulation, 10:32742 (R;DE;In German)

Bonn Univ. (Germany, F.R.). Physikalisches Inst.
- Experimental results on hadron pair production by two photons, 10:32551 (R;DE)
- Nicolai maps and stochastic observables from a coupling constant flow, 10:32622 (R;DE)
- Survey of two-photon physics: What have we done, where are we going, 10:32576 (R;DE)

Boston Coll., Chestnut Hill, MA (USA). Dept. of Physics
- Effects of magnetic shear on lower hybrid waves in the suprauroral region. Final report, 1 April 1983-31 March 1984, 10:32458 (R;US)

Boston Univ., MA (USA). Dept. of Physics
- Finite temperature corrections to field theory: electron mass and magnetic moment, and vacuum energy, 10:32852 (R;US)

Brigham Young Univ., Provo, UT (USA). Dept. of Chemical Engineering
- Coal-water mixtures combustion modeling. Final report, 6 May 1983-6 August 1984, 10:29719 (R;US)

Brigham Young Univ., Provo, UT (USA). Dept. of Chemistry
- Supercritical fluid chromatography/supersonic jet spectroscopy. Progress report, February 1, 1985-April 30, 1985, 10:29790 (R;US)

Advanced vehicle systems assessment. Volume 1. Executive summary, 10:31423 (R;US)

Demonstration of transparent solar array module design. Final report, 10:30308 (R;US)

Multijunction cells for concentrators: technology prospects, 10:30307 (R;US)

Novel sorbents for high temperature regenerative H_2S removal. Quarterly report No. 4, November 1984-January 1985, 10:29619 (R;US)

Results of the 1984 NASA/JPL balloon flight solar cell calibration program, 10:30306 (R;US)

What should DOE do to help establish voluntary consensus standards for measuring and rating the performance of PV modules, 10:30548 (R;US)

Johannesburg City Council (South Africa)

Theory, design, and operation of nutrient-removal activated-sludge processes, 10:31375 (R;ZA)

Johns Hopkins Univ., Baltimore, MD (USA)

Prediction of thermodynamic properties of coal derivatives. Progress report, September 1, 1984-August 31, 1985, 10:31669 (R;US)

Johns Hopkins Univ., Baltimore, MD (USA). Dept. of Chemical Engineering

Thermodynamics of multi-polar molecules: the perturbed-anisotropic-chain theory, 10:31670 (R;US)

Joint Inst. for Lab. Astrophysics, Boulder, CO (USA)

Nonthermal radio emission and the HR diagram, 10:32429 (R;US)

Joint Inst. for Nuclear Research, Dubna (USSR)

Universal control drive unit using micro-computer and its application in the SPN-1 spectrometer, 10:32053 (R;SU;In Russian)

Joint Inst. for Nuclear Research, Dubna (USSR). Dept. of New Acceleration Methods

Conditions for electron beam matched injection in collective accelerator adgezator, 10:31947 (R;SU;In Russian)

Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation

Calculation of matrix elements of the three-body system relativistic Hamiltonian in adiabatic representation, 10:32863 (R;SU;In Russian)

Two-dimensional magnetic field numerical simulation of 3 T superconducting dipole with iron yoke, 10:31897 (R;SU;In Russian)

Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy

Comparative analysis of proton and alpha-particle interactions with C, O and Ag, Br nuclei at 4.5 GeV/c per nucleon, 10:32688 (R;SU;In Russian)

Energy- and A-dependences of the nucleon emission intensity in hadron-nucleus collisions, 10:32789 (R;SU)

Neutral particle 4N channel of Serpukhov accelerator, 10:31895 (R;SU;In Russian)

Polarization effects in hadron fragmentation, 10:32603 (R;SU)

Stopping and energy deposition of hadrons in target nuclei, 10:32730 (R;SU)

Thermodynamic analysis and optimization of cryogenic helium systems with satellite refrigerators, 10:31739 (R;SU;In Russian)

Two-dimensional magnetic field numerical simulation of 3 T superconducting dipole with iron yoke, 10:31897 (R;SU;In Russian)

Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics

Density and entropy of the pion excitations in the nuclear matter, 10:32790 (R;SU;In Russian)

Investigation of phase transitions in a superionic conductor using the neutron scattering method, 10:31569 (R;SU;In Russian)

Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems

AUTOP program package for spectrometric data on-line processing using small computers, 10:33093 (R;SU;In Russian)

Measurement of the neutrino helicity in the decay of sup(152m)Eu with Ge(II) detector, 10:32564 (R;SU;In Russian)

Role of DNA repair in the realization of oxygen effect in bacteria Escherichia coli irradiated with various types of radiation. The balance of repair systems and the sensitivity to radiation, 10:32313 (R;SU;In Russian)

Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions

Calculation of some characteristics of the beam dynamics in the central region of the U-400 cyclotron, 10:31896 (R;SU;In Russian)

Decay of highly excited compound nuclei: a statistical approach, 10:32731 (R;SU;In Russian)

Optimization of measurement conditions at determining the nitrogen content in a grain using the gamma-activation method, 10:31615 (R;SU;In Russian)

Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics

Conformally invariant equation for the symmetric tensor field, 10:32648 (R;SU)

Description of Elambda - transitions taking into account of phonon components in wave functions of odd deformed nuclei, 10:32672 (R;SU;In Russian)

Description of (^{7}Li, ^{7}Be) charge-exchange reactions within the framework of microscopic DWBA, 10:32671 (R;SU;In Russian)

Hidden symmetry, separation of variables and interbasis expansions in the two-dimensional hydrogen atom, 10:32494 (R;SU;In Russian)

Nonleptonic decays of charged baryons in chiral theory (account for baryon poles), 10:32604 (R;SU;In Russian)

Quantum mechanics and Hopf fibre bundles. Green function, 10:32864 (R;SU;In Russian)

To the theory of scattering by two potentials, 10:32865 (R;SU;In Russian)

Joint Publications Research Service, Arlington, VA (USA)

Construction, testing of 1-MW nitrogen laser, 10:31761 (R;US)

Joint Task Force One, Washington, DC (USA)

Operation Crossroads. Atomic bomb tests Able and Baker conducted at Bikini Atoll, Marshall Islands on 1 July 1946 and 25 July 1946. Volume 1. History of Director of Ship Material report, 10:32100 (R;US)

Operation Crossroads. Atomic bomb tests Able and Baker conducted at Bikini Atoll, Marshall Islands on 1 July 1946 and 25 July 1946. Volume 3. Appendix v: pictorial review. History of Director of Ship Material report, 10:32101 (R;US)

Junta de Energia Nuclear, Madrid (Spain). Div de Quimica y Ambiente

X-ray fluorescence analysis of uranium concentrates, 10:31637 (TG;US)

K

Kaernbraenslesaekerhet, Stockholm (Sweden)

KBS Technical report 1-120 (1977-1978). Summaries, 10:29938 (R;SE)

Kaiserslautern Univ. (Germany, F.R.)

Experiments for liquid metal embrittlement of fusion reactor materials by liquid lithium, 10:31466 (R;DE;In German)

Karlsruhe Univ. (T.H.) (Germany, F.R.). Fakultaet fuer Maschinenbau

Production of value and entropy in separation nozzles. Numerical calculations based on molecular probe measurements, 10:29886 (R;DE;In German)

Kentucky Univ., Lexington (USA)

Mechanisms of fatigue in coal liquefaction environments. Progress report, 10:29622 (R;US)

Organic oxygen characterization of coal and coal liquids. Quarterly progress report, February-April 1985, 10:29657 (R;US)
